Nor wax so fast dissolve by heat of shining Sun.
These things which now I speak I do account but small,
That corps should run with filthy core, may caused be by flame.*

Yet bones are spared in fire, here all away they fall,

Of them and marrow sweet, fate lets no sign remain.

Among the Cyniph plagues, this still shall bear the bell,

The soul they take, this soul and carcase both,

The Seps, though short it be, in force it is a bell,

Devouring bones, the body all undoth.

Thus you hear that more largely expressed by *Lucan* of the Seps, which was more briefly touched by *Nicander* of the Sepedon, and all cometh to one end, that both kill by putrefaction. The length of this Serpent is about two cubits, being thick toward the head, but thin and slender toward the tail. The head thereof is broad, and the mouth sharp, it is of many colours, so as some have thought that it could change colour like a *Chamaeleon*. The four under teeth are hollow, and in them lyeth the poyson, which are covered over with a little skin.

Pausanias affirmeth that he himself saw one of them, and that *Egyptus* the son of *Elatas*, a King of *Arcadia* was slain by one of these. They live in Rocks, in hollow places of the Valleys, and under stones, and they fear no Winter, according to this verse of *Pictorius*.

Hic hyemis calidus frigora nulla timet.

Which may be Englished thus;

Of Winters cold it hath no feat,

For warm it is throughout the year.

First of all after the wound appeareth some blood, but that symptom lasteth not long, for by and by followeth matter smelling very strong, swelling tumor, and languishing pain, and all the parts of the body affected herewith become white, and when the hair falleth off, the patient seldom liveth above three or four days after. The cure hereof is by the same means that the poyson of the Viper, the Amodyte and Horned-serpent is cured withal. And particularly *Aetius* prescribeth a sponge wet in warm Vinegar to be applyed to the wound, or else to lay the ashes of chaffe with the earth upon which they are burned, to the place, and to anoint it with Butter and Honey, or else lay unto it Millet and Honey, likewise Bay-sprigs, Oxymel, Purslain, and in their dyet salt fish.

Aetius.

Aristotle writeth of a little Serpent, which by some are called a sacred and holy Serpent, and he saith that all other Serpents do avoid it, and flie from it, because whatsoever is bitten by it, presently rotteth. It is in length (as he saith) a cubit, and it is rough all over, and therefore I take this Serpent to be a kinde of Sepedon. Also *Aristoxenus* saith, that he knew a man by touching this Serpent to die, and afterward that the garment which he wore at the time of the touching of the Serpent, did likewise rot away. And thus much for the Seps and Sepedon.

of the SLOW-WORM.

This Serpent was called in ancient time among the *Grecians* *Tybllops* and *Typhlynes*, and *Cophia*, because of the dimnesse of the sight thereof, and the deafnesse of the ears and hearing, and vulgarly at this day it is called in *Greece*, *Tephloti*, *Tefliti*, and *Tephlini*, and from hence the *Latines* have taken their word, *Cecilia*, quae *caecus Serpens*, a blinde Serpent, and it is also called *Cernula*, *Cacnla*, and *Ceriella*, as witnesseth *Albertus*, because the eyes thereof are

Scaliger.

none at all, or very small. The *Italians* call it *Bisa orbala*; and the *Florentines*, *Lucignola*; the *Germans*, *Blindenscheber*; the *Helvetians*, *En vieux*, at *annoix*, and the people of *Narbon*, *Nadels*.

It being most evident that it receiveth name from the blindenesse and deafnesse thereof, for I have often proved, that it neither heareth nor seeth here in *England*, or at the most it seeth no better then a *Mole*. The teeth are fastned in the mouth, like the teeth of a *Chamaeleon*, the skin is very thick, and therefore when the skin is broken by a hard blow, the whole body doth also break and part asunder. The colour is a pale blew, or sky-colour, with some blackish spots, intermixed at the sides. There is some question whether it hath one or two rims on the belly, for seeing they conceive their young ones in their womb, they have such a belly by nature, as may be distended and stretched accordingly as the young ones grow in their womb. It hath a smooth skin without all scales. The neather eye-lid covereth all the eye it hath, which is very small: about the head they are more light coloured, then about the other parts of the body: The tongue is cloven, and the top thereof very black. They are in length about a span, and as thick as a mans finger, except toward the tail which

Oswaldus.

which is more slender, and the female is more black then the male. The passage or place of excrements or conception is transverse. If they be killed with the young in their belly, the little ones will instantly creep out at their dams mouth, and sometimes (as witnesseth *Bellonius*) in this little Serpent are found forty little young ones. They are in *Greece* and *England*, and come not abroad till *July*, and they go into the earth in *August*, and so abide abroad all harvest, and they love to hide themselves in Corn-fields under the ripe corn when it is cut down. It is harmlesse except being provoked, yet many times when an Ox or a Cow lyeth down in the pasture, if it chance to lie upon one of these Slow-worms, it biteth the Beast, and if remedy be not had, there followeth mortality or death, for the poyson thereof is very strong. If it swell, it is good to prick the place with a brazen bodkin, and then apply unto it Fullers-earth and Vinegar. There is a Triacle made of the Slow-worm, which smelleth like *Aqua-vite*; with this some men are cured of the Plague. And thus much of this little Serpent.

Of the SNAKE.

There is no reasonable learned man that maketh question, that *Anguis* in *Latine* is a general word for all kinde of Snakes and Serpents, and therefore when *Virgil* writeth of the fury *Alecto*, how she cast a Snake into the bosome of *Amata*, he first of all calleth it *Anguis*, a Snake, and presently after *Coluber* & *Vipera*, a Serpent, as appeareth by these verses following. *Aeneid.* 7.

Huic dea cœruleis unum de crinibus anguem

Conjicit, inq; sinum præcordia ad intima subdit:

Vipeream inspirans animam, fit tortile collo

Aurum ingens Coluber. —

Which may be Englished thus;

To her the Goddesse a Snake made of the Gorgons hair,

Which to the bottom of her breast and entrails made to slide,

Inspiring to her a Vipers soul though she were fair,

For chain of gold an Adder bout her neck did glide.

And this is the lesse to be admired or doubted, seeing the very word *Anguis* seemeth to be derived of *Angulosus*, winding or turning, for every kinde of Serpent may be folded or winded up together almost in every fashion. Yet sometimes, as the *Græcians* use *Ophis* for one kinde, as *Hemorrhe* or *Hor* for Asp, so also is the word *Anguis* used for one kinde, which we call a Snake, that is, a little Serpent living both in the water and on the earth. Howbeit, as we shall shew afterward, when it is in the water it is called *Hydrus* and *Natrix*, and when it is on the land, it is called *Cheersydus*.

Among the ancient Pagans, Snakes were accounted the gods of the Woods, and this caused *Persius* to write this verse following;

Pingite duos angues, pueri, sacer est locus.

That is, O ye children, draw the figure of two Snakes, for this place, (meaning the grove of Wood) is a holy place, and sacred to the Gods. And in like sort, the Snake in ancient time was sacred to *Aesculapius*, because it was thought to be without venom, and to contain in it many excellent medicines or remedies against other evils, and also a kinde of divine power or help to drive away calamities, whereof I remember that I have read this story in *Valerius Maximus*.

Rome (saith he) our City was for three years together continually vexed with Pestilence, so as neither the mercy of God could be obtained for the release of this evil, nor all wit, power, or industry of man put an end unto it. At last by the care and travail of the Priests, it was found in the writing and Books of *Sibyll*, that unlesse they could obtain of the *Epidaurians* the holy Snake of *Aesculapius*, there should be no end of that pestilence.

For which cause there were Ambassadors sent to the City of *Epidaurus*, to entreat at the hands of the Citizens and Priests, that holy Beast or Snake (as was prophaneely supposed) and they attained the end of their journey, for the *Epidaurians* did kindly entreat them, and sent the Snake of *Aesculapius*, and then (saith he) *Tam promptam Epidauriorum indulgentiam numen ipsius Dei subsequutum, verba mort alium cœlesti obsequio comprobavit:* That is, The very grace and power of God seconded that favourable indulgence of the *Epidaurians*, and with an heavenly obsequiousnesse allowed and performed the words and writings of mortal creatures, (meaning the *Sibyls* writings aforesaid.) For that Snake (which the *Epidaurians* never see but they worship, with as great reverence as they would *Aesculapius* himself; for it never appeareth but for their exceeding great good and commodity) began to slide about the broadest streets and noblest part of the City, gently looking upon every body, and licking the earth, and so continued three days, to the religious admiration of all the beholders, bearing an undoubted aspect and alacrity, for the obtaining and aspiring a more beautiful habitation: so at last it came to the Isle neer *Rome*, called *Tyrimis*, whereinto in the sight of all the Mariners it did ascend and enter, and lodged it self round in that place, where standeth the house of *Quintus Ogulimus*: which story is thus most excellently followed by *Ovid* in his *Metamorphos*.

The

The folk of Rome came hither all by heaps, both men and wives,
 And eke the Nuns that keep the fire of Vesta as their lives
 To meet the God, and welcome him with joyful noise : and as
 The galley rowed up the stream, great store of incense was
 On altars burnt on both the banks, so that on either side,
 The fuming of the Frankincense, the very air did hide,
 And also slain in Sacrifice full many cattel dyed.
 Anon he came to Rome, the head of all the world : and there
 The Serpent lifting up himself began his head to bear
 Right up along the mast, upon the top whereof on hie,
 He looked round about a meet abiding place to spie :
 The Tyber doth divide it self in twain, and doth embrace
 A little Isle *Triremis*, for so the people tearm the place,
 From either side whereof, the banks are distant equal space :
 Apollo's Snake descending from the mast, conveyed him thither,
 And taking off his heavenly shape, as one repairing hither,
 To bring our City healthfulnesse, did end our sorrows quite.

Thus saith *Ovid* : But the truth is, that the Poet did but faign this thing for the excitation and stirring up of the mindes of men to Religion and religious worship of the Heathen Gods ; and therefore this Snake of *Epidaurus* was but a fiction, and therefore in the beginning of the History he maketh it to be *Æsculapius* in the likenesse of a Snake, for in a vision he sheweth how that *Æsculapius* appeared to the Roman Ambassador, and told him that he would appear in that form, saying ;

*Pone metus, veniam, simulachraq; nostra relinquam,
 Hunc modo Serpentem, baculumq; neribus ambis,
 Perspice & usq; nota, visum ut cognoscere possis ;
 Vertar in hunc, sed major ero, tantusq; videbor,
 In quantum verti celestia corpora possunt.*

Which may be Englished thus ;

*Fear not, for I will come and leave my shrine.
 This Serpent which doth wreath with knots about this staffe of mine,
 Mark well and take good heed thereof, for into it transformed will I be,
 But big too I will be, for I will seem of such a size,
 As wherein may celestial bodies turn suffice.*

But all Poets are so addicted to faigning, that I may self may also seem while I imitate them, to set down fables for truth : and if ever there were such a Snake as this, it was Diabolical, and therefore in nature nothing to be concluded from it, and in that place of Rome called *Biremis* and *Triremis*, was *Æsculapius* worshipped. And at this day in the Gardens called *S. Bartholomews-Gardens*, there is a Marbleship, on the side whereof is the figure of a creeping Snake, for the memory of this fact, as writeth *Gyraldus*.

But in the Emblems and documents of the ancient Heathen, it is certain that *Æsculapius*, and the Snake and the Dragon, did signifie health, and from hence it came to have the name of the Holy-snake, and also to be accounted full of medicine. The true occasion in nature, was for that about the Countries of *Bononia* and *Padua*, they have a Snake which they call *Bisse*, and *Bisse-angue-sanca*, and about *Padua*, *Autza*, which they say is harmlesse. And as well children as men, do often take up the same into their hands, with no more fear and dread then they would do a Coney, or any other tame and meek creature.

By the relation of *Pellinus*, it is in length five spans and five fingers, the head also compared with the body, is long, and in the neck thereof are two blanches, and betwixt them a hollow place, the back part whereof is attenuated into a thin and sharp tail, and upon either chap they have many teeth, which are sharp, and without poyson ; for when they bite, they do no more harm then fetch blood only, and these men for ostentation sake wear about their necks ; and women are much terrified by them in the hands of wanton young boys. The back of this Snake, (as writeth *Erastus*) is blackish, and the other parts green, like unto Leeks, yet mixed with some whitenesse, for by reason it feedeth upon herb, it beareth that colour. They are also carryed in mens bosoms, and with them they will make knots. For the same *Erastus* affirmeth, that he saw a Fryer knit one of them up together like a garter, but when he pulled it harder then the Snake could bear, it turned the head about and bit him by the hand, so as the blood followed, yet there came no more harm, for it was cured without any medicine, and therefore is not venomous.

In the Mountain of *Mauritania* called *Ziz*, the Snakes are so familiar with men, that they wait upon them at dinner time like Cats and little Dogs, and they never offer any harm to any living thing, except they be first of all provoked. Among the *Bygerons* inhabiting the *Pyrenes*, there be Snakes four foot long, and as thick as a mans arm, which likewise live continually in the houses, and not only come peaceably to their table, but also sleep in their beds without any harm, in the night-time.

Phurnut.

Lea Afric.

Olaus.

time they hisse, but seldom in the day time, and pick up the crums which fall from their tables. Among the Northern people they have household Snakes, as it were household Gods, and they suffer them both to eat and to play with their Infants, lodging them in the Cradles with them, as if they were faithful Keepers about them, and if they harm any body at any time, they account it *Pium piaculum*, a very divine and happy mischance. But after they had received the Christian faith, they put away all these superstitions, and did no more foster the Serpents brood, in detestation of the Devil, who beguiled our first Parents in the similitude of a Serpent. Yet if it happen at any time that a house be burned, all the Snakes hide themselves in their holes in the earth, and there in short space they so encrease, that when the people come to re-edifie, they can very hardly displant their number. *Plautus* in his *Amphitryo*, maketh mention of two named Snakes, which descended from the clouds in a shower; but this opinion grew from the fiction of the *Epidaurian Snake*, which only by the Poets is described with a mane and a combe, and therefore I will not expresse the Snakes to have a mane.

There is no cause why we should think all Snakes to be without poyson, for the Poet hath not warned us in vain, where he saith;

Erigidus, o pueri fugite hinc, latet Anguis sub herba:

Which may be Englished thus;

Fly hence you boys as far as feet can bear,

Under this herb a Snake full cold doth leare.

For this cause we will leave the discourse of the harmlesse Snake, and come to those which are no way inferior to any other Serpent, their quantity and spirit being considered, wherefore we are to consider, that of Snakes which are venomous and hurtful, there are two kindes, one called the Water-snake, the other the Land-snake. The Water-snake is called in Greek, *Hydra*, *Hydros*, *Hydrales*, *Karouros*, and *Enhydri*, in Latine, *Natrix*, and *Lutrix*. *Munster* calleth it in Hebrew, *Zepha*, and *Avicen* relateth certain barbarous names of it, as *Handrius*, *Andrius*, and *Abides*, and *Kedasuderus*, *Echydru*, and *Aspistichon*. The Germans call it *Nater*, *Wasser-nater*, and *Wasser-schlange*: and they describe it in the manner as it is found in their Countrey, which doth not very far differ from them of our Countrey here in England. It is (as they say) in thicknesse like the arm of a man or childe, the belly thereof yellow, and of a golden colour, and the back blackish-green, and the very breath of it is so venomous, that if a man hold to it a rod newly cut off from the tree, it will so infect it, that upon it shall appear certain little bags of gall or poyson. And the like effect it worketh upon a bright naked sword, if it do but touch it with the tongue; for the poyson runneth from one end to the other, as if it were quick, and leaveth behinde a line or scorched path, as if it had been burned in the fire.

And if this Serpent fortune to bite a man in the foot, then is the poyson presently dispersed all over the body, for it hath a fiery quality, and therefore it continually ascendeth, but when once it cometh to the heart, the man falleth down & dyeth. And therefore the meetest cure is to hang the party so wounded up by the heels, or else speedily to cut off the member that is bitten. And that which is here said of the Water-snake, doth also as properly belong the Land-snake, seeing there is no difference betwixt these, but that at certain times of the year they forsake the water when it draweth or falleth low, and so betake themselves to the land.

They live in the water and in the earth, (but they lay their egges on the land in hedges or in dung-hills) and especially in those waters which are most corrupt, as in pools where there is store of Frogs, Leaches, and Newts, and but few fishes, as in the Lakes about *Puteoli*, and *Naples*, and in England all over the Fens, as *Ramsay*, *Holland*, *Ely*, and other such like places, and when they swim they bear their breast above the water. They abound also in *Corcyra*, and about *Taracina* in Italy, and in the Lake *Nyctea*, and especially in *Calabria*, as the Poet writeth:

*Est etiam ille malus Calabris in saltibus Anguis,
Squammea convolvens sublato pectore terga,
Atque notis longam maculosus grandibus alvum,
Qui dum amnes ulli rumpuntur fontibus, & dum
Vere madent udo terræ ac pluvialibus austris,*

*Stagna colit, ripisque habitans hic piscibus atram
Improbis ingluviem, rarisque loquacibus explet.
Postquam exhausta palus terræque ardore dehiscunt,
Exilit in siccam & flammantia lumina torquens
Sevit agris, asperque siti, atque exterritis æstu.*

Which may be thus Englished;

*That evil Snake in the Calabrian coasts abides,
Rowling his scaly back by holding up the breast,
And with great spots upon large belly glides,
When as the Rivers streams in Fountains all are ceast.
For whiles the moistened Spring with rain from South wind falls,
It haunts the Pools, and in the water all black it feeds,
In ravening wise both Fish and Frogs do fill his gall,
For why, when Summers drought enforce, then must it needs
Fly to dry land, rowling his flaming eye,
Rage in the fields to quench his thirst full dry.*

There

There be some Writers that affirm, that there is a certain stone in a Water-Snakes head, which it casteth or vomiteth up when the skin thereof is fleyed from the body, and after it is so cast up, it must be received into a piece of silk, the vertue whereof is to be proved after this manner; Fill a brasse Caldron or Kettle full of water, and about the same vessel so filled, binde this stone fast, as it were to the handle or bayl thereof, and you shall finde that every day this stone so remaineth bound to the Kettle, that the water will decrease eighteen ounces. And this *Kiranides* affirmeth that he bound to a woman that had the Dropsie, and she was thereby delivered from her disease; for every day he found that her belly did fall the quantity of four fingers, until it came to the natural bignesse, and then he took it off, for he saith, that if he had not then taken it off, it would also have dried up the native humidity.

In like sort, the vertue of this stone is applyed against the rheume in the legs, or any flux of the eyes, ears or head, but the use of it must not exceed the quantity of three hours at a time. It also driveth out of the body all venomous Worms, and is a special remedy against their biting and stinging. This stone is also called *Serpentinus* and *Draconites*, but it is questionable whether it be generated in the head of the Snake, or by their vaporous breath, concurring together in the Spring or Winter season. Some of these stones are said to be of a blewish green colour, and the form thereof pyramidal: *Albertus* saith, he hath seen one of them that was black, and not lightsome, only about the edges of it there was some palenesse apparent, and in the superficies or upper part thereof, there was (as he writeth) a beautiful picture of a Snakes proportion, and the vertue thereof did put to flight venomous Beasts, and also cure their harmful poysons.

Such like things we have already shewed to be in the stone which the Toad is said to have, but this stone is more likely to be the *Ophites*, for in the Castle of *Tangra*, once the seat or habitation of *Charles* the fourth, there is a Chappel wherein are many precious stones, wrought in the walls and doors, and among divers other these *Ophites*. But whereas there is a pyramidal form attributed to these stones, I take it therefore that it is the same which *Pliny* calleth *Glossapetra*, for in shew it resembleth the tongue of a Snake, and the tongue of a Snake being great or broad at the root, and smaller toward the end or tip thereof, is rightly said to be of a pyramidal form: and among the *Germans* it is called by a peculiar word, *Naterzungen*, that is, Snakes-tongue.

And such a kinde of stone as this Snakes-tongue, (as *Agricola* and some other Authors write) is found in a certain earth neer *Linuburgh* in *Saxony*. And *Conradus Gesner* affirmeth, that there is a certain Town in *Germany* called *Aenipou*, where there is one of these stones half a cubit long, and therefore it seemeth that they are not all generated in Serpents or Snakes heads. Among the *French-men* this stone is called *Sugne*, because there be Serpents seen in it twynning their tails together, or folding them one within another.

There was wont to be a superstitious way to extract or expresse this stone from out of the Snake, which was done in this manner; First, when they had taken the Snake alive, they did presently hang her up by the tail, then just underneath her they did make a suffumigation of Laurel, and so did conjure the Snake, saying; *Per Dominum qui te creavit, lapidem tuum quem in capite tenes te instanter ejicere jubeo*: This kinde of enchanting charm, I hold not worthy to be translated, and yet let me not be blamed for the relation of it, seeing it is pertinent to this story to know all the good and evill about these Serpents. And therefore, not to expresse the same at all, might argue in me, either ignorance, or filly precisenesse: and again on the other side, to make it vulgar, might bring me into suspition of some approbation: therefore let the Reader know it from me, but understand it from some other.

And for mine own opinion, I account no better of these Snake-stones then I do of the Toad-stones, concerning which I have already given my opinion in another place. And therefore what here is related of this stone, let it be examined, and then be either received or refused.

Many, and almost infinite are the Epithets which are given to Snakes, whereby their nature is expressed, as *Aliger anguis*, the winged Snake, black, fierce, blew, greedy, wilde, cold, Gorgonean, wreathen, sliding, deadly, lightsome, spotted, martial, threatening, purple, wholesome, scaly, terrible, winding, grim, swelling, fearful, venomous, green, infolded or implicit, horrible, hissing, Marsian, Maurian, pestilent, retorted, and such other like, as it hath pleased the severall Authors writing hereof to ascribe and attribute unto it. Which we will not prosecute with any explication, but only leave them to the Readers pleasure, being only content to nominate them.

There is great account or reckoning made of their egges, which they lay in the Summer time, for first of all they are so glewed and conjoynd together, partly with the spittle and moistnesse which proceedeth from their mouths, and partly with the spume and froath of their own body, that a man seeing their heaps, would judge them to be coupled together by some artificial devise. These egges thus knotted together in bunches, the *Latines* call *Anguinum*. The *Druides* or ancient Wisards of *England* and *Scotland*, have delivered, that if the Snake hisse, these will of their own accord fly up into the air, and then if some wise man take them by prevention, before they touch the ground again, the Snakes will follow him as fast as any Horse, until he come to some River, into the which they dare not enter.

And the folly of these also proceeded so far, that they were not ashamed to report, that if one of these *Anguines* or bunches of egges, were tyed to a piece of gold, it would swim in a River against the stream. These they commended unto Princes and Great men to carry about with them in the time of wars and other contentions, and that therefore when a *Roman Knight* of *Volontii*,
was

was found by *Claudius* to carry one of these about him, he was by the Emperors commandment put to death.

But to leave vanities, we will prosecute the true and natural description of their egges in this manner; They are round and soft, in colour white, cleaving (as we have already said) together in great bunches, forty, or fifty, or a hundred in a cluster, without, they are covered with a skin or crust, much harder and whiter then the substance contained within it, which is like matter, or the rotten Egges of a Hen or Duck, in quantity as big as Bullies, Plums, and seldom bigger, being most commonly very round and orbicular. Yet *Gesner* reporteth, that he had one sent him of the proportion of a Lentil, and as great as the fist of a Man, and within every egge appear certain small things, like the tails of Serpents, or Leaches, being in number ten, five greater and five smaller, one folded or lapped within another. And these have also little pustules upon the skin or crusts, whereof one doth not touch the other.

Out of these Egges come the young ones, but I cannot affirm what great affection the old ones bear unto them, or that when many Snakes lay their egges together every one in that multitude hath skill to discern her own Egges from the other. For I have been with other my Colleagues or School-fellows when I was young, at the destruction of many thousands of them, and never perceived that the old Snake did with any extraordinary affection fight for their egges, but rather forsook them, and suffered us to do with them what we pleased: which sometimes we brake, sometimes scattered abroad upon the dunghill out of which we digged them, and sometimes we cast them into the next River we came at, but never saw any of them recollected again to their former place by the Snakes, although the place were very full of them, and therefore I conclude for mine own experience, that Snakes cannot be perceived to bear any exceeding love in nature to their egges or young ones.

Their ordinary food for the most part, is earth, Frogs, Worms, Toads, and especially Paddocks, or crook-backed Frogs, Newts, and small fishes. The Foxes and Snakes which are about the River *Nilus* are at continual variance, and besides, the Harts are by nature common enemies to all Serpents.

They are not in venom inferiour to other Serpents, for they infect the waters neer to houses, and are many times the causes of diseases and death, whereof the Physitians cannot discern. When they bite or sting, there followeth extream pain, inflammation, greenesse or blacknesse of the wound, dizziness in the head, and death within three days. Whereof dyed *Phylotetes*, General of the Fleet of Greece, in *Lemnos*, *Dedalus* and *Menalippus*.

The cure of this evil must be by Origan stamped and laid to the sore with Lie and Oyl, or ashes of the root of an Oak with Pitch, or Barley-meal mixed with Honey and Water, and sod at the fire. And in drink take wilde Nosewort, Daffadil flowers, and Fennel-seed in Wine. And it is also said, that a man carrying about him the Liver of a Snake, shall never be bitten by any of that kinde. And this Liver is also prescribed against the Stone in the Bladder, being drunk in strong drink. And thus much for this Serpent.

Of Spiders and their several sorts.

And first of those that are commonly called PHALANGIES.

Doctor Bonham's discourse of Spiders.

THIS kinde of venomous creature, of the Latines is called *Aranus*, or *Aranea*, and of Cicero in his Books *De natura Deorum*, *Araneola*, and *Araneolus*. Of the Grecians, *Arachnes* or *Arachne*. *Hesiodus* termeth it *Stibe*; the Hebrews name it *Acobitha*, *Acbar*, *Acabith*, and *Semamith*; the Arabians, *Sibih*, and *Phibib*; in the German tongue *Spin*, and *Banker*; in English, *Attercop*, *Spider*, and *Spinner*; of the Brabanders, *Spinne*; in France, *Araigne*; in Italy, *Ragno*, and *Ragna*; in Spain, *Arana* or *Tarana*; of the Illyrians it is called *Spawanck*; of the Polonians, *Pajak*, and *Pajeczino*; of the Hungarians, *Pex*; of the Barbarians, *Koatan*, and *Kerserat*. *Isidore* in his twelfth Book saith, that the Spider is termed *Aranus*; because she is both bred and fed in the air: but herein he hath fallen into a double error. For if they lived only in the air, and by the air, as he would seem to enforce, I marvel to what end and purpose they should so busily make and pitch their nets for the ensnaring of flies? And if they receive their first being and breeding in the air, I cannot see to what purpose they do either lay egges, or exclude small little Worms after their coupling together.

But we will easily pardon this presumptuous Etymologist, and diver deep into Interpretations, with others also of the same humor, whose ordinary custom thus to dally and play with words, is with them esteemed as good as Statute-law, for the most part. There are many sorts of Spiders, and all of them have three joynts a piece in their legs.

Estq; caput minimum toto quoq; corpore parvum est,

In latere exiles digiti pro crutibus haerent,

Latera venter habet, de quo tamen illa remittet

Stamina.

Which

Which may be Englished thus;

Little is their head, likewise the body small,
All over is, and fingers thin upon the sides,
In stead of legs, out of the bellies flank do fall:
Tet out of which she makes her web to glide.

All Spiders are venomous, but yet some more, and some lesse. Of Spiders that neither do nor can do much harm, some of them are tame, familiar, and domestical, and these be commonly the greatest among the whole pack of them. Others again be meer wilde; living without the house abroad in the open air, which by reason of their ravenous gut, and greedy devouring maw, have purchased to themselves the names of Wolves, and hunting Spiders. The least sort of these weave no webs at all, but the greater beginneth to make a small and harsh web about hedges nigh unto the earth, spreading and setting the same abroad in the very entry, and in void places neer their lurking holes, their deceitful nets, observing very diligently the stirring of their deceitful webs, and perceiving them moving, though never so lightly, she maketh no stay, but with all speed possible hastneth her self to the place, and whatsoever she there findeth, she seizeth upon as her lawful prize.

The most dangerous and hurtful Spiders are called *Phalangia*, if they bite any one, (for they never strike) their poyson is by experience found to be so perillous, as that there will a notable great swelling immediately follow thereupon. These kindes of venomous Spiders, are of two sundry sorts, for some of them are lesser, and some greater. The lesser sort are very unlike one to another, and of changeable colours, violent, libidinous, hot, stirring, sharp-topped, holding on their pace and way, as it were in jumping manner or leaping-wise: and these I finde to be called by *Aristotle* in his 11. Book *De Animal. Psullas*, or *Pulices*, and *Pitbeci* or *Simii*. Of some they are called *Oribates*, because they are usually found among Trees that grow upon Mountains. They are also called *Hypodromi*, because they live under the leaves.

The *Phalangium* or *Phalanx* Spider, is unknown in *Italy* (as *Pliny* saith) and there are found many sorts of them. One sort of them is very like unto a great Pismire, but much bigger, having also a red head, but all other parts are black, speckled, and garnished with many white spots running all alongst their bodies. This formicarian or Pismire-like *Phalanx*, of *Aetius* is described to have a body much resembling foot in colour, his neck ash-coloured, and his back glistering, as it were with many stars on it. *Nicander* calleth it *Agrostes*, and *Aetius*, *Lucos*. The *Latines* tearm it *Venator*, that is, the Hunter. This stingeth but weakly, without any pain at all, but yet it is somewhat venomous, though not very much. This kinde of *Phalanx* is often found among Spiders webs, where (after the fashion of some Hunters) they beguile and intrap Flies, Gnats, and Bees, Gad-flies and Wasps. And (if *Lonicerus* write no more then may be warranted for truth,) those great Horse-flies or Ox-flies and Brimsees, that in Summer season vex Cattle, and whatsoever they lay their clowtches on, that they hold fast and destroy; and thus live they by taking of booties and preys.

There is no man (I think) so ill advised, that will confesse this to be the same creature which *Aristotle* calleth *Pulex*, for the body of that by his description is broad, rowling, round, and the parts about the neck have certain lines or cuts: and besides, about the mouth there appear and seem to bud forth three eminencies or standings out.

There is another sort of *Phalangium*, called by *Nicander*, *Rox*, of *Aetius*, *Ragion*, of *Ælianus*, *Rhax*, (because it is so like the kernel or stone that is found in Grapes,) and this kinde of Spider is of a round figure, black in colour, the body glistering, and round as a ball, with very short stumped feet, yet nevertheless of a very swift pace. They have teeth, and their mouth is nigh their belly, and when they stir, they gather up their feet very round. In the description of this Spider, *Aetius*, *Ælianus* and *Pliny* do wholly consent and agree in opinion, and yet *Ælianus* was a little besides the way, when he set down *podas macrous*, for *microus*, long feet for short feet; and that this kinde of Spider was only found in *Lybia*, and not elsewhere.

That kinde of Spider termed of *Pliny*, *Asterion*, seemeth to be all one with the former, saving that this is more known by his little white spots made star-wise, and the glistering stripes or rays where-with his body seemeth to be over-sprinkled. *Pliny* only mentioneth this, as if *Aristotle*, *Aetius*, *Galen* and *Avicen*, had never heard of it.

The most venomous and hurtful of all these, is that which *Nicander* calleth *Pedeoros*, of colour azure, or bright blew, which hath long, high, and lofty feet on both sides of the body. The Scholiast addeth *Dasu* and *Meteoron*, that is, *lanuginosum* and *sublime*, soft like cotten or Wooll, and lofty or high, and not *sublime lanuginosum*, as *Lonicerus* translateth it. *Pliny* saith, that this Spider hath a black mossinesse or soft down, although it will scarce sink into my head, that any Spider that is of an azure or blew colour, hath any soft hairs, or woolly substance of a black colour.

There is another kinde of *Phalangium* Spider called of *Nicander*, *Dysderi*, which name is neither to be found in *Aristotle*, *Pliny*, nor *Aetius*, nor yet in any other ancient Author that ever I could read, which some others call, and that very properly, *Sphexion*, *quasi vesparium*, because it is so like a red Wasp, saving that it lacketh wings, and this Wasp-like Spider is of a passing deep red colour, and counted far worser then the blew Spider, although the azure or blew Spider only by

Uuu

touching

touching doth infect with poyson, and will break any Cryстал glasse, if it run over it though never so speedily, or do but touch it in glancing wise, as *Scaliger* beareth witnesse.

There are two sorts of *Phalangie* Spiders called *Tetragnatha*, and the worser is that which hath half of his head divided with one white line, and another white line running crosse-wise. There is another of these not so hurtful as the former, and this is of an ash-colour, and very white in the hinder-parts. There is also a Spider coloured as this is, that maketh her web by walls sides for the taking of Flies, which as some affirm, hath little or no venom in it at all. *Aetius* saith, that the *Tetragnathus* is a kinde of *Phalangium*, having a broad and whitish body, rough footed, with two swelling or little bunches standing out in the head, the one somewhat broad, the other standing right forth, so that at the first, one would imagine that it had two mouths, and four jaws.

Aelianus in his xvij. Book, chap. 40. saith, that there is great store of these to be found in *India* about the River *Arrhata*, where their multitude is so dangerous and mischievous, as that they bring death and destruction to the Citizens and people bordering nigh those places. And *Strabo* the Geographer, in his xvj. Book telleth us, that beyond the *Lybian* and on the Western side of *Africk*, there is a Countrey left destitute of Inhabitants, having goodly large fields and pastures, being uninhabitable by reason of the multitude of Scorpions there bred, and of the Spiders called *Tetragnathoi*.

There is to be found in Harvest-time amongst Pease, Beans, and other sorts of pulse, (when they are gathered and reaped by the hand) certain small Spiders called *Kantharidessi Eikela*, in shew like unto *Cantharides* or Spanish-flies, of a very red and fiery colour, such as we Englishmen call *Twinges*, by eating or licking up of which, both Oxen and other Beasts do many times die. There is another kinde of *Phalangium* that breedeth altogether in the pulse, called *Ervum*, which is like unto Tares, and likewise in the Peach tree, which *Nicander* and *Aetius* tearm *Granocalaptes*, and *Dioscorides* nameth it *Kephalokroustes*, because it is so presumptuous bold as to strike at the hands of travellers by the High-ways, when as either it passeth down in gliding manner by her fine thread, or that she tumbleth down without any stay of thread or other support. It is a small creature to see to, keeping on the pace very fearfully, nodding with the head, reeling, and as it were staggering, being great and heavy in the belly, somewhat long of body, and of a greenish colour. It carryeth a sting in the top of her neck, and striking at any, she commonly aimeth at those parts which are about the head. And as *Aetius* saith, *En tois phullois tes per seias trepheteis, kai ta ptera echei homois tais en tais kustais psuchais*: That is, they are nourished in Peach tree-leaves, and they have wings like unto Butter-flies that are found amongst Barley.

Whereupon the Scholiast seemeth to insinuate to us, that this kinde of Spider is winged, which no man (as I judge) hath hitherto observed. *Ponzettus* and *Ardoynus* do take the *Granocalaptes* to be a *Tarantula*, but herein they are both mistaken, as was *Rabbi Moses* before them. The Spider called *Sclerocephalus*, in form differeth but little from the former. It hath a head as hard as a stone, and the lineaments and proportion of the body do much resemble those small creatures which are seen about Lamps lights, or candles in the night time.

There cometh in the last place to be described, the *Phalangie* Spider of *Apulia*, commonly known by the name of *Tarantula*, taking his denomination from the Countrey of *Tarentum*, where there are found great store and plenty of them. *Ferdinandus Ponzettus* imagineth, that it hath but only six feet, and *Ardoynus* is of the same judgement, and further faigneth, that it hath a stretched out tail. *Rasis* calleth a *Tarantula*, by the name of *Sypta*, *Albucahis*, *Alsari*, *Rabbi Moses*, *Aggonfarpa*, *Avicen*, *Sebigi*, *Doctor Gilbert*, *Taranta*, therein following *Ardoynus*, which maketh two sorts of *Tarantulaes*, the one of a brown, the other of a yellow colour and cleer shining, such as are to be found in *Egypt*. *Pliny* (as you read a little before) said that the *Phalangium* was not known in *Italy*, but in these days they are found throughout all the Southern parts of that Countrey, especially nigh the Sea-shore, as both Harvest-men and Hunters can well testifie by their own wofull experience.

Ponzettus was much deceived, when in his third Book and xv. chapter entreating of the Scorpion, he expressly affirmeth the *Phalanx* to be such a venomous flye. It is a vengible and cruel creature (as *Alexander ab Alexandro* saith) and to be touched, horrible, venomous and pestilent: and most especially their biting is exceeding venomous in the parching heat of the Summer, but at other seasons of the year not so great. There be many sorts of Spiders found in very cold Countries, but no *Phalangies* at all; or if there be any, yet have they very little poyson in them, and nothing comparable to them of hotter Climates.

All the sorts of *Phalangies* do lay their Egges in a net or web, (which for the purpose they make very strong and thick,) and sit upon them in very great number, and when their brood is increased to some growth, they kill their dam by their hard embracements, and sling her clean away; and further, casting off all fatherly affection, they many times serve the male with the same sauce, if they can come handlomely by him, for he is a helper to the female in sitting over their egges. They hatch at one time three hundred, as hath been seen by the testimony of *Bellonius*, in his Book *Singul. observat.* chap. 68. The *Tarantulaes* lie commonly lurking in holes, chinks, and chaps of the earth, and with their teeth they bite and wound at unawares, incircumspect Mowers, and harvest-folks, and rash Huntsmen, who think of no such matter: and therefore they that are acquainted with their sleights, do wear Boots and Gloves on their hands and legs, for their further defence, so often as they go forth either to hawking, hunting, or to reaping and mowing, or any such like labour in the common fields.

All these Spiders are venomous even naturally, for that is so settled and deeply fastened in them, as it can by no means be eradicated or taken away. Neither suck they this venom and poysonous quality from plants or herbs, as many men think, which in very truth they never so much as tast of, neither do they purchase this venomous complexion and nature from any naughty, hurtful, and malignant quality that is in their meat, by reason their chief food and sustenance is Flies, Gnats, and Bees; and without question they can suck and draw no such cacochemical juyce from their bodies. If the Formicarian (which I call the Pismire-like) *Phalangie* do bite any man, there will presently follow most fearful accidents: for it bringeth an exceeding great tumor upon the wounded place, the knees are loose and feeble, trembling of the heart, and decay of strength do succeed, and sometimes it induceth death it self.

The signes to know when one is bitten of any Phalangie and the effects of the same.

Nicander saith, that they who are bitten of this kinde of Spider, do fall into such a profound sleep, as that they will never be awaked, for they have and suffer that which Histories report of *Cleopatra* Queen of Egypt, who to escape the fingers of *Augustus*, because she would not be brought to Rome in triumph, caused two Serpents called Asps, to be set to her breasts, which did sting her to death, whose nature is to give a heaviness and sleep, without any shrinking or mark in the skin, only putting forth a gentle sweat out of the face, as if one were in a trance and hard to be awaked.

The Spider called *Agrostis*, maketh but a small wound with her biting, and in a manner without any pain at all, and no ways deadly, unlesse it be but slightly regarded, or that no care be had for the cure in the beginning. The *Phalangie* that is called *Dusderus*, which is fashioned like a Wasp, if he hurt any one by his biting, it causeth the same accidents that the azure or blewish-coloured Spider doth, but yet not altogether so terrible and vehement. And besides, the *Dusder* spider with her poyson, bringeth a wasting and pining away of the whole body by degrees, without any great sense.

If a man be poysoned with that kinde of Spider which is found among pulse, and is (as I said before) like unto *Spanish* Flies, there will presently arise certain pustules, risings or swellings, much like unto blisters, as if one were scalded with hot water, in which swellings there will commonly be much yellowish matter; besides, the patient is much disquieted, vexed, and too much out of order; the eyes seem to be writhed, deformed, looking askint on the one side, the tongue faltereth and stammereth, not being able to sound their words, or to pronounce directly: their talk is idle, they wander and rove up and down in great perplexity; their heart being tormented, tossed and turmoiled with an extraordinary kind of furious passion.

The Spider that is found in the pulse, called *Errum*, which is very like to Tares or Vetches, produceth by his venom the same evil effects that the former doth; and if Horses or other beasts do by chance devour any of them, their bodies are so inflamed by means of their unquenchable thirst, that many times they burst asunder in the midst. If the *Cranocalaptes* wound any man (as *Pliny* assureth us) it is not long before death it self do succeed. And yet *Nicander* and *Aetius* hold the contrary, and would make us believe that his hurt is soon remedied, without any great ado: yet herein they do consent, that if any be hurt with any Spider of this kinde, there will follow a great pain of the head, coldness, swimming and giddiness of the brain, much disquietness of the whole body, and pricking pains of the stomach. But notwithstanding all this (saith *Nicander*), the patient is soon remedied, and all these above-rehearsed passions quickly appeased and brought to an end.

The *Sclerocephalus*, as it much resembleth the *Cranocalaptes* Spider in form and proportion, so in his force, effect and violence they are much alike, causing the same symptoms, accidents and passions as the former. The wound that the Spider called *Ragion* inflicteth, is very small, so that a man can hardly discern it with his eyes; but yet if one be hurt therewith, the lower part of the eyes, and the eye-lids wax very red. Besides, the patient feelth a shivering cold or chilnesse in his loins, with weakness and feebleness in the knees, yea the whole body is taken with a great quaking cold, and the sinews by means of the violence and ranciness of the poyson, suffer a Convulsion. The parts serving to generation, are made so impotent and weak, as that they are not able to retain the seed, nor yet to contain their urine, which they void forth much like in colour to a Spiders-web, and they feel the like pain as they do which are stung with Scorpions.

Of the the wounding of the Star-spider feebleness and weakness followeth, so that one cannot stand upright, the knees buckle, sleep and shaking drowsiness seizeth upon the hurt parts: and yet the worst of all is the blewish Spider, for this bringeth dimness of the eye-sight, and vomiting, much like unto Spiders and cobwebs in colour, fainting and swooning, weakness of the knees, heavy sleeps, and death it self.

If a man be wounded of the *Tetragnathian* Spider, the place waxeth whitish, with an intolerable, vehement, and continual pain in it, and the member it self withereth and pineth away even to the very joints. Finally, the whole body by receiving any wholesome sustenance, is nothing at all relieved thereby, yea and after a man hath recovered his health, yet is he nevertheless disquieted by much watching for a long time after, (as *Aetius* writeth.) *Nicander* in expresse words confesseth, that the Ash-coloured *Tetragnath*, doth not by his biting infuse any venom or like hurt. If the speckled *Phalangie* of *Apulia*, which is usually known by the name of *Tarantula*, do bite any one, there will follow divers and contrary accidents and symptoms, according to the various constitution, different complexion, and disposition of the party wounded. For after they are hurt

by the *Tarantula*, you shall see some of them laugh, others contrariwise to weep, some will clatter out of measure, so that you shall never get them to hold their tongues, and othersome again you shall observe to be as mute as fishes: this man sleepeth continually, and another cannot be brought to any rest at all, but runneth up and down, raging and raving like a mad man.

There be some that imagine themselves to be some great Lords or Kings, and that their authority, Empire and signory, extendeth it self far and wide; and for that cause they will seem to charge others by vertue of their absolute and Kingly authority, and as they tender their favours, and will avoid their displeasure, to see this or that businesse dispatched; and with others again the contrary conceit so much prevaieth, as by a strong imagination they cannot be otherwise dissuaded but that they are taken prisoners, that they lie in some deep dungeon or prison, with bolts and shakels about their feet, so many as their legs can bear, or that their neck and feet lie continually in the stocks. You shall see some of them to be cheerful, quick of spirit, and lively, with dancing, swinging and shaking themselves. With others again you shall have nothing but sadness, and heaviness of minde, brown-studies, unaptnesse to do any thing, as if one were astonyed, so that nothing but numnesse, and dulnesse of moving and feeling, seemeth to pinch them, being to see to very senselesse.

In conclusion, as drunkennesse to sundry persons is not all one, but much different, according to the diversity of complexions, and natural constitution of the brain: so neither is the madness or frenzy fits of these persons all one that be infected with a *Tarantulaes* poyson: but some of them are fearful, silent, ever trembling and quaking: and others again are more fool-hardy, rash, presumptuous clamorous, full of noise, doing nothing else but call and cry out; and some few seem to be very grave, constant and stedfast, that will not alter their purposes for a world of wealth. But let them be affected either with this or that passion, yet this is common to them all, as well to one as to another, that they are generally delighted with musical Instruments, and at their sound or noise will so trip it on the toes dancer-like, applying both their mindes and bodies to dancing and frisking up and down, that during the time of any musical harmony, they will never leave moving their members and limbs, like a Jackanapes that cannot stand still. And which is more strange, they will use these motions and gestures when they are ready to depart this life, through the lingering stay and vehement cruelty of the poysons operation: and yet for all this, though they be so neer unto death, yet if they hear any musick, they come again to themselves, newly gathering their spirits and strength, and with a greater alacrity, promptnesse of minde and cheer, they foot it as frolickly as ever they did or could have done.

And thus doing and dancing both day and night, without any notorious intermission, and by their continued sweating, the poyson being dispersed into the pores of the skin, and evaporated by insensible transpiration or breathing out, are at length by this means recovered to their former health and state of body. And if the Pipers and Fiddlers cease playing with their musick, though never so little a while, before the matter of the poyson be in some part exhausted, then will they make a recidivation and returning to their former passions and griefs, with which they were at first tormented and disquieted. But yet this is the most strange, deserving the greatest admiration of all, that all those persons which are bitten or wounded by any *Tarantula*, they will dance so well, with such good grace and measure, and sing so sweetly, and withall descant it so finely and tunably, as though they had spent all their life time in some dancing and singing-school.

Nevertheless, *Cardan*, contrary to all authority and experience, calleth in doubt and question this point, and at last concludeth that they cannot be restored to health again by musick. Wherein he doth marvelously repugn and contrary, both *Fælix*, *Platerus*, *Theodorus*, *Zwingerus*, *Andreas*, *Matthiolus*, *Bellunenſis*, *Ponzettus*, *Paracelsus*, and many other famous learned men. Truly, a bare contradiction against so great authorities, is far unworthy and unbecoming a man any thing (though never so little) seen or exercised in Philosophy: much more so great a Philosopher and Physitian as *Cardan* was. Yet sure I am of the opinion, that *Cardan* did not erre in Philosophy through ignorance, but having a desire to appear more learned, he did ever bend himself to impugn that, which he knew the soundest and best part of men did hold and maintain. But this little which I have here spoken, shall serve sufficiently for the discussing of *Cardans* opinion.

And surely, if the harmonical sound and melody of warlike drums and trumpets, hath cured furious, mad, and enraged Horses, and mitigated the pain of their legs and hips, as *Aſclepiades* hath written, I see nothing to the contrary, but that it may help those persons that are wounded of any *Tarantula*. The Pope with his Poll-shorn generation, have mustered divers of the Saints together, and have assigned and appointed to each his sundry charge and several office apart, for the cure of sundry diseases. As for example, *S. Anthony* can heal the burning; *S. Roch* the Pestilence, notwithstanding that *S. Sebastian* hath some skill in it also. *Saint Cosmus* and *Damian* are good for all bites and swelling diseases. *S. Job* for the pocks. *S. Appolin* for the tooth-ach. *S. Petronella* can drive away all manner of Agues. And *S. Vitus* or *Vitulus* (we may well call him *S. Calf*) that in times past excelled in the musical Art, doth direct all Dancers, or such as will leap or vault: So that if this Saint be invocated and pacified with musical harmony and melodious sound of instruments, he will be an excellent Apothecary and Doctor for the curation of any that are wounded with a *Tarantula*. Superstitious people fondly imputing that to the Patron and Proctor sometimes of Musick, which ought rather to be attributed to Musick it self, and motion of the body.

Dioscorides concerning the common bitings of hurtful Spiders or *Phalangies*, writeth thus: The accidents (saith he) that do accompany the bitings of Spiders, are these that follow: The wounded place waxeth red, yet doth it not swell nor grow very hot, but it is somewhat moist. If the body become cold, there will follow trembling and shaking, the groin and hams do much strout out, and are exceeding distended; there is great provocation to make water, and striving to exonerate nature, they sweat with much difficulty, labour and pain. Besides, the hurt persons are all of a cold sweat, and tears distil from their eyes that they grow dim-sighted therewith. *Aetius* further addeth, that they can take no rest or sleep, sometimes they have erection of the yard, and the head itcheth, other whiles the eyes and calfs of the legs grow hollow and lank, the belly is stretched by out means of winde, the whole body is puffed up, but in especial the face, they make a maffeling with their mouth, and stammer, so that they cannot distinctly be understood.

Sometimes they can hardly void urine, they have great pain in the lower parts, the urine that they make is waterish, and as it were full of Spiders webs, the part affected hath a great pricking and swelling, which *Dioscorides* (as you read a little before) will by no means yeeld to, and it is a little red. Thus far *Aetius* from whom *Paulus Aegineta*, *Aliuarius*, *Ardoynus* and some others differ but a little. In *Zacynthus* an Isle in the *Ionian-Sea*, on the West of *Peloponnesus*, if any there be hurt of a *Phalangium*, they are otherwise and more grievously tormented then in any other place, for there the body groweth stiffe and benumbed; besides, it is very weak, trembling and exceeding cold. They suffer also vomiting with a spasm or cramp, and inflammation of the virge, besides an intolerable pain in the ears and soles of their feet. The people there do cure themselves by bathes, into which if any found man after that do enter to wash himself, or be drawn into the same by any guile or deceitful means, he will forth-with fall into the same griefs and passions, that the other sick patient endured before he received remedy. And the like to this writeth *Dioscorides*, in his Chapter of *Trifolium asphaltites*, in these words following.

The decoction (saith he) of the whole plant being used by way of fomentation, bathing or soking the body, ceaseth all those pains which are caused by the biting or stinging of any venomous Serpent: and with the same bathing or fomenting whatsoever ulcerous persons shall use or wash himself withall, he will be affected and have the same accidents, as he that hath been bitten of a Serpent.

Galen in his Book *De Theriaca ad Pisonem*, ascribeth this to miracle, accounting it a thing exceeding common reason and nature: but I stand in doubt that that Book was never *Galen's*, but rather fathered upon him by some other man. And yet *Aelianus* writeth more miraculously, when he affirmeth that this hapneth to some healthy persons, and such as be in good plight and state of body, never so much as making any mention of ulcer or sore. Thus much of the symptomes, accidents, passions or effects which stick and wait upon those that are hurt by Spiders. And now I come the cure.

The general cure, according to the opinion of *Dioscorides*, is, that first there must be scarification made upon the wounded place, and that often, and cupping glasses must be applyed and fastened with much flame to the part affected. *Absyrus* counsel is to make a fumigation with Eggeshells first steeped in water, and then being cast on the coals with Harts-horn or *Galbanum*, to perfume the venomd part therewith. After that to use Scarifications, to let blood, or to suck the place; or to draw out the venom with Cupping-glasses: or (which is the safest course of them all) to apply an actual Cautery, except the place affected be full of sinews. Lastly, to provoke sweat well, either in bed, covering the patient well with cloathes, or it is better by long and easie walking to procure sweating. In some to attain to the perfect curation, you must work both with inward and outward means, such as here shall be prescribed and set before your eyes: whereof the most choise and approved I have set down for the benefit of the Reader: and first I will begin with *Dioscorides*.

Inward Medicines out of *Dioscorides*.

Take of the seeds of Southern-wood, Anise, Dill, the wilde Cicer, of the fruit of the Cedar tree, Plantain and Trifoly, of each a like quantity; beat them to powder by themselves, before you do mix them: The dose is two drams to be taken in Wine. Likewise one dram of the seeds of Tamarisk drunk in Wine, is very effectual. Some use decoction of *Chamepitys*, and the green Nuts of the Cypress tree in Wine. There be some which praise the tree of Cray-fishes, to be taken with ashes, milk, and Smallage seed; and this medicine experience hath approved and confirmed, for the ceasing of all pains. Lye made of Fig-leaves is drunk with good successe against all bitings of Spiders.

It is good also to take the fruit of the Turpentine tree, Bay-berries, leaves of the balm, and the seeds of all sorts of Carrots: or to drink the juyce of Mirtle-berries, of the Berries of Ivy, or Mulberries, the juyce of Colewort leaves, and of Clives or Goose-grease with Wine or Vinegar. A dram of the leaves of Been-trifoly drunk in Wine, the decoction of a *Sparagus*, juyce of Sen-green, or any opening juyce is good for the same. Some use with very good successe, the leaves of the herb called Balm with Nitre, and Mallows, boyled both leaf and root, and so taken often in a potion. The leaves of the herb called *Phalangium*, with his flowers and seeds. The seeds of *Nigella* also serve to the same end.

Medicines out of Galen.

Take of *Aristolochia*, of *Opium*, of either alike much, four drams, of the roots of Pellitory of Spain three drams. Make thereof Trochiscs, to the quantity of a Bean. The dose is two Trochiscs, with three ounces of pure Wine. The ashes of a Rams hoof tempered with Honey, and drunk with Wine. Remedies of *Diophantes* against the bitings of *Phalangies*. Take of Astrologe or Hartwort four drams, of Pellitory of Spain as much, Pepper two drams, *Opium* one dram, make thereof Trochiscs to the quantity of a Bean, and take two of them in a good draught of pure Wine. Another more excellent: Take of the seeds of wilde Rue, Rocket-seed, Styra, *Sulphur vivum*, of either alike much six drams, of *Castoreum* two drams, commix them to make Trochiscs, as before, with the bloud of a Crevish. The Dose is one scruple and a half in Wine. Another: Take of Myrrhe, *Castoreum* and Styra, of either one dram, *Opium* two drams, of *Galbanum* three drams, Smallage-seeds and Anise-seeds, of either alike two ounces and a half, Pepper thirty grains; make them up with Wine so much as is sufficient. Another: Take of Myrrhe five ounces, of Spikenard six drams, of the flower of *Juncus rotundus* two drams and a half, *Cassia* four drams, Cinamon three drams, white Pepper one dram and a half, Frankincense one dram and half a scruple, *Coffus* one dram, make them up with Attick Honey: The dose is the quantity of a Hasel nut, to be taken either in Mulse or water.

Remedies out of Apollodorus.

Take of wilde Cummin two ounces and a half, the bloud of a Sea Tortoise four drams, the rennet of a Fawn or Hare three drams, the bloud of a Kid four drams; make them up with the best Wine, and reserve it to your use: The dose is the quantity of an Olive, in a draught of the best and purest Wine. Another: Take of the seeds of *Trifolium Bituminosum*, of round Astrologe, the seeds of wilde Rew, the seeds of *Ervum* dryed in the Sun, of each alike six drams; work them with Wine and make Trochiscs thereof, every one of them weighing four drams: The dose is one Trochisce. Read more in *Galen*, in his second Book *De Antid.* where any man may find many for the same purpose, which he had gathered and selected from divers Authors.

Out of Aetius, and Paulus Aegineta.

Take of *Sulphur Vivum*, and of *Galbanum*, of either four drams, of bitter Almonds excorticated one dram, of the Gum called Benzoin four drams, temper them in Wine, and after their maceration, work them up with some Honey to be taken inwardly. Being thus prepared, it may likewise be applied outwardly. Another: Take of *Ameos* two drams, roots of Flowrt-de-luce one dram, or else of Saint Johns-wort, or *Trifolium Bituminosum*, drink them out of Wine. Or take of Anise-seeds, wilde Carrets, Cummin, *Nigella Romana*, Pepper and Agarick, of either one dram, and drink them. Or take the leaves of the Cypress tree, or the Nuts beaten in Wine, and three quarters of a pinte of the best Oyl, and give it to drink.

And to this end they do prescribe Bay-berries, Scorpion-grasse, wilde Thyme, Calamint, Chame-pitys, either to be taken by themselves alone, or with Rew and Pepper. *Asclepiades* used these that follow: Take of the seeds of *Angelica* and Calamint, of either alike much, and powned together, to be taken in six ounces of Wine oftentimes in a day. Another: Take of Benzoin, the seeds of the wilde Carret, of dry Mints and Spikenard a little quantity, temper them up with Vinegar: The dose is one dram, with pure water and Vinegar mixed together about five or six ounces. Another more excellent: Take Garlick and eat it, and a bath made of the same with Wine, and likewise all those medicines which do heal the bitings of Vipers, are notable in these cases. *Paulus Aegineta* commendeth all these very highly, and so doth he the seeds of *Agnus Castus*, or the leaves of the white Popler.

Out of Nicander.

Take of the purest Turpentine that distilleth out of the Pine-tree, and eat or drink it: for this is a very effectual medicine, which, as *Bellonius* reporteth, he hath found to be true by experience.

Out of Avicenna.

The fruit of the Myrtle tree, *Doronicum*, Mastick, *Asa Fetida*, Dedder, With-winde and his root, the Nut of India, and white *Bdellium* drunk with Wine. Take of the roots of *Aristolochy*, roots of Floure-de-luce, of Spike, Pellitory of Spain, the seeds of wilde Carrot, black Hellebore, Cummin, the roots of the true Daffadil, of the fruit of the Carob-tree, the leaves of Dates, tops of Pomgranates, Cinamon, of the juyce of Rue, Cray-fishes, Styra, *Opium*, and *Carpobalsamum*, of either alike, one ounce, all these being powdered, make thereof Trochiscs the weight of one dram or four scruples, which is their dose: Take also in Wine the decoction of the

the seeds of *Trifolium Bituminosum*, Cypress-nuts, and the seeds of Smallage. Besides let him drink the grains or fruit of the Pine-tree, Cumin of *Æthiopia*, the leaves and rinde of the Palne-tree, the seeds of *Siler Montanum*, black and wilde Cicers, the seeds of Nigella, Southern-wood and Dill, Astrologe or Hartwort, the fruit of the Tamarisk-tree: for all these are very effectuell to cure the hurts that come by biting of any venomous Spider.

The juice also of wilde Lettice and House-leek is excellent. The decoction of Cypress-nuts being boyled, especially with Cynamon, the broth of Crai-fishes, and of Goose-flesh, and likewise the decoction of the roots of *Asparagus* in wine and water. Another. Take of Astrologe and Cumin of each three drams to be drunk in warm water: an excellent and approved Antidote. Take of the seeds of Git or Nigella ten drams, Cumin-seed, *Daucus*-seed (or wilde Carret) of either five drams, Spikenard, Bay-berries, round Aristolochie, *Carpobalsamum*, Cinamon, roots of Gentian, seeds of the Mountain, Siler, and Smallage, of every one alike two drams, make a Confection with Honey. The dose is the quantity of a Nut with old Wine. A confection of *Assa*. Take of *Assa fetida*, Myrrhe, and leaves of Rue, of every one alike quantity, temper them together with Honey. The common dose is one dram, or two at the most in Wine.

Certain other selected Medicines out of Absyrtus, Albucafis, Lullus, Rhazes and Ponzettus.

Take of white Pepper thirty grains, drink it often in a draught of old Wine. Give also the herb Thyme in Wine. *Absyrtus*. Let him drink after it a spoonfull of Wine distilled with Balm. *Lullus*. Take of drie Rue, of *Costus*, Horsemint, Pellitory of Spain, *Cardamomum*, of each alike, of *Assa fetida* a fourth part, Honey so much as is sufficient, commixe them. The dose is the quantity of a Hasel-nut in drink. *Albucafis*. The brain of a Hen drunk with a little Pepper out of sweet Wine or Vinegar and water mixed together.

A notable Treacle or Antidote against the bitings of *Phalangies* or venomous Spiders. Take of *Tartarum* six drams, of yellow Sulphur eight drams, Rue-seeds three drams, *Castoreum* and Rocket-seed, of either two drams, with the bloud of a Sea-tortoise, make an Opiate. The dose is two dramsto be taken in Wine. Another. Take of Pellitory of Spain, and the root of the round Aristolochie of each one part, of white Pepper half a part, Horehound four parts, temper them up with Honey, the dose that is to be given is one dram. Another. Take of the roots of Capers, the roots of long Aristolochie or Hartwort, Bay-berries, roots of Gentian, of each a like quantity to be taken in Wine, or let him drink *Diaffa* with sweet strong Wine, Cumin, and the seeds of *Agnus Castus*. Another. Take of the seeds of Nigella ten drams, of *Daucus* and Cumin-seeds, of each alike five drams, seeds of wilde Rue, and Cypress-nuts, of either three drams, Spikenard, Bay-berries, round Astrologe, *Carpobalsamum*, Cynamon, the root of Gentian, seeds of *Trifolium Bituminosum*, and of Smallage-seed, of either two drams, make a Confection with Honey so much as is sufficient. Give the quantity of a Nut with old Wine. *Rhazes*.

Out of Plny, Celsus, and Scaliger.

It is good to give five Pismires to them that are bitten of any *Phalangium*, or the seeds of *Nigella Romana* one dram, or Mulberries with Hypocistis and Honey. There is a secret vertue and hidden quality in the root of Parsley, and of wilde Rue, peculiarly against those hurts that Spiders infect by their venome. The bloud of a Land-tortoyse, the juice of *Origanum*, the root of *Beben Album*, *Vervain*, *Cinquesoil*, all the sorts of Sengreen, Cypress-roots, the Ivy, of Ivy-roots being taken with some sweet Wine, or water and Vinegar mixed and boyled together, are very Speciall in this grief. Likewise two drams of *Castoreum* to provoke vomiting being relented in some mulse. *Apollodorus* one of the Disciples of *Democritus*, saith, there is an herb called Crocides, which if any *Phalangium* or other poysonous Spider do but touch, presently they fall down dead, and their poyson is so dulled and weakned as it can do no hurt. The leaves of the Bul-rush or Mat-rush which are next to the root being eaten, are found to give much help. *Pliny*. Take of Myrrhe, of *Una Taminea*, which is the berry of the herb called *Ampelos Agria*, being a kinde of Bryony, which windeth it self about trees and hedges like a vine, of some called our Ladies seal, of either alike, and drink them in three quarters of a pinte of sod Wine. *Item*, the roots of Radish or of Darnell taken in Wine is very effectuell. *Celsus*. But the excellentest Antidote of all other is that which *Scaliger* describeth, whom for his singular learning and deep conceit, I may tearm *Nostri orbis et seculi ornamentum*: The form whereof in this place I will prescribe you. Take of the true and round Aristolochia, and of the best Mithridate, of either one ounce, *Terra Sigillata* half an ounce, of those Flies which are found to live in the flower of the herb called *Napellus*, in number eighteen, juice of Citrons so much as is sufficient, mixe them all together. For against this mischief of Spiders, or against any other shrewd turns, grievances, or bitings of any Serpents whatsoever Art, as yet never found out so effectuell a remedy, or so notable an Alexipharmacall. Thus far *Scaliger*. The juice of Apples being drunk, and Endive, are the proper Bezoar against the venom of a *Phalangie*. *Petrus de Albano*. Thus much of inward: Now will I proceed to generall outward medicaments and applications. Five Spiders putrefied in common Oyl, and applyed outwardly to the affected place, are very good. Ashes made of the dung of draught beafts tempered with Vinegar, and used as an oyntment, or instead of Vinegar, water and Vinegar boyled together, and applyed as before, are proved to be singu-

singular. Take of Vinegar three pintes and a half, *Sulphur vivum* two ounces, mixe them, and foment, bath, or soke the wounded part with a Sponge dipped in the liquor, or if the pain be a little asswaged with the fomentation, then wash the place with a good quantity of Sea-water.

Some hold opinion that Achates (which is a precious stone, wherein are represented divers forms, whereof some have the nine masts, some of *Venus*, &c. will heal all bitings of *Phalangies*, and for this cause being brought out of *India* it is held at a very deer rate in this Countrey. *Pliny*. Ashes made of fig-tree-leaves, adding to them some salt and wine. The roots of the wilde *Panax* being beaten to powder, *Aristolochie*, and Barley-meal kneaded together and wrought up with Vinegar. Water with Honey and salt applyed outwardly for a fomentation. The decoction of the hearb Balm, or the leaves of it being brought to the form of a Pultesse, and applyed: but we must not forget to use warm bathes, and sometimes to the place agrieved. *Pliny*. Cut the veins that appear under the tongue, rubbing and chafing the swelled places with salt and good store of Vinegar: then cause the patient to sweat carefully and warily for fear of cold. *Vigetus*. *Theophrastus* saith, that practitioners do highly commend the root of *Panax Chironia*. Moysten the wound with Oyl, Garlick bruised, Knot-grasse or Barley-meal, and Bay-leaves with Wine, or with the dregs or Lees of wine, or wilde Rue applyed in manner of a Cataplasme to the wounded place. *Nonnus*. Take of *Sulphur Vivum*, *Galbanum*, of each alike, four drams and a half, of *Euforbium* half a dram, Hesel-nuts excorticated two drams, dissolve them, and with wine make towards the curation. Flies beaten to powder and applyed upon the place affected. The fish called a Barble cureth the bitings of any venomous Spider, if being raw it be slit asunder in the middest, and so applyed (as *Galen* saith) Anoynt the whole body with a liquid Cerote, and foment the place affected with Oyl wherein *Trifolium Bituminosum* hath been infused, or bathe it often with Sponges soked in warm Vinegar: then prepare and make ready Cataplasmes of these Ingredients following; that is, of Knot-grasse, *Scala Celi*, called *Salomons* seal, Leeks, Cheesill or Bran decocted in Vinegar, Barley-meal and Bay-berries, and the leaves boyled in Wine and Honey. Some do also make Cataplasmes of Rue or herb-grace, and Goats-dung tempered with Wine, Cypresse, Marjoram and wilde Rue with Vinegar. An emplaster of *Asclepiades*. Take of the seeds of wilde Rue, and Rocket-seeds, Stavesakre, Rosemary seeds, *Agnus Castus*, Apples and Nuts, or instead of these two, of the leaves of the Cypresse-tree, of each alike, beat and temper them all together with Vinegar and Honey. *Aetius*. Apply the decoction of Lupines upon the affected place, the eschar being first removed, then anoynt it in the warm Sun-shine, or against the fire with the fat of a Goose tempered with wilde Rue and Oyl, or else of the pap of Barley, and the broth of Lupines make a Cataplasme. *Oribasius*. The Filberd-nut that groweth in *India*, healeth the biting of these *Phalangies*. *Avicenna*. Goats dung dissolved with other convenient Cataplasmes, and Oyl of Worm-wood, and the juice of Figs helpeth much. *Kiranides*. Apply oftentimes a cold piece of iron to the place. *Petrus de Albano*. Foment the place very often with the juice of the herb Plantane. *Hildegardis*.

The artificiall Oyl of Balm is singular. *Eunymus*. A fomentation made of the leaves and stalks of *Imperatoria* called Masterwort, and continued a good space: or else *Vervain* bruised and stamped, the juice being taken in wine, and further, the herb outwardly applyed, is much commended of *Turneiser*. Beat and stamp herb grace with Garlick and some Oyl, and apply it outwardly. *Celsus*. There be but a few particular cures for the bitings of Spiders that Physitians mention; yet some they doe, although the generall be most effectuell. *Pliny* against the biting of the *Formicarian* or Pismire-lik *Phalangie*, that hath a red head, commendeth much another *Phalangie* of the same kinde, only to be shewed to the wounded patient to look upon, and to be kept for the same purpose, though the Spider be found dead. Also a young Weasel dryed, and the belly thereof stuffed with Coriander-seed, and so kept till it be very old and stale, and drunk in Wine, being first beaten to powder, is likewise good for the same intention.

There is a certain little beast called *Ichneumon*, of some it is called *Mus Pharaonis*, *Pharoes* Mouse, and for the enmity unto Serpents, it is called *Ophiomachus*, (as *Bellonius* reporteth) being bruised and applyed to the biting of any Wasp-like *Phalangie*, doth utterly take away the venome of them. It often entreth and searcheth out the seats and holes of venomous Spiders and *Phalangies*, and if it finde any of them, she haleth and tuggeth them clean away as a Pismire doth a small grain of Corn: and if the *Phalangie* offer any resistance, the *Ichneumon* sparing no labour, pulleth her the contrary way: and by this strugling and striving, sometimes it so falleth out that the *Ichneumon* is wearied, and then she breatheth a little, and gathering new strength and courage, setteth again upon the *Phalangie* with a fresh assault, and woundeth her many times, so that at length she carrieth her to her own lodging there to be devoured.

If the *Tarantula* have hurt any one, the best remedy is to stirre and exercise the body continually without any intermission, whereas in all hurts that are caused by any other Spiders, rest and quietnesse are the best means (as *Celsus* affirmeth.) But their Antidote is musick and singing.

Christophorus de honestis counselleth to take forthwith *Theriaca Andromachi* without any delay. He also adviseth to take Butter tempered with Honey, and the root of Saffron in Wine. His proper Bezoar (saith he) or the green berries or seeds of the Lentisk-tree. *Ponzettus* in his book *De venenis*, adviseth to take ten grains of the Lentisk-tree in Milk, or an ounce and a half of the juice of Mullberry-leaves.

In the increase of the grief, he cureth them with Agarick, or the white Vine: and after much sweating, they are to be comforted and refreshed or strengthened with cold Medicines, as with the water

water of Popy, and the like (*Merula* saith) they are to be remedied with the stone of Muscicall Instruments, dancing, singing and colours: concerning the three former I will not contend, but how they should receive any part of help or health from viewing of any colours I do not well understand; considering that the eye-sight of all those that are bitten of a *Tarantula*, is quite taken away, or they see but obscurely, as being mightily deceived in their objects.

Andreas Matthiolus in his Commentaries, upon the sixth book of *Dioscorides*, Chap. 40. reporteth a very strange story of a certain Hermit, his old friend and acquaintance dwelling neer unto *Rome*, who cured all those who were bitten or hurt of any venomous Worms or Serpents, which in this last place I will insert (although some may say that it is needlesse, and belongeth not at all to this discourse in hand, or else will not beleve it.) For when as any of the inhabitants in those parts were wounded of any poysonous Serpent, by a Messenger forthwith signified the same to the old Hermit; who by and by demanded of the Messenger, whether he could be content to take or drink any Medicine instead of the sick patient; which if the other assented to, promising to take it, the Hermit commanded him without any further delay, to pull off his right foot shooe, and to set his foot on the earth, drawing a line round about the foot with his knife: then he willed him to take away his foot, and within the space of the line so marked, he writ or engraved these words following *Cave Caruze, sanum reduce, reputata sanum, Emanuel paracletus*. Then immediately he pared away the earth with the same whittle, so that all the Characters were quite defaced, putting the same earth into a little earthen vessell full of water, letting it there so long remain, untill the earth sunk to the bottom: Lastly, he strained the water with a piece of the Messengers shirt, or some other linnen that he wore next to his skin, and being signed with the sign of the Crosse, gave it him to drink: But surely (*saith Matthiolus*) it was marvellous strange, and a wonderfull thing to consider, how that the wounded patient was perfectly healed, even at that very hour and moment of time, that the Messenger took the aforesaid potion of the Hermit, as it is plainly known unto my self, and to all the people that dwell round about in that Territory or Shire. And thus much of this Heremiticall curation by the way.

Now will I come into my path again. A man may finde a great sort both of these, and the like remedies both in *Pliny*, *Dioscorides*, and other, concerning the hurts of Spiders, but I think I have been a little too tedious, and you may imagine that I do nothing but *Ta. arachina hyphainein, Araneorum telas texere*: That is, in a frivolous matter and of small moment spend infinite and curious labour; so that I had more need to crave pardon for my long discourse about this subject, wherein though many things may want to the satisfaction of an afflicted and searching head, yet I am sure here is enough to warrant the discharge of my good will, and to repell the censure of the scrupulous;

Nunc imus ad illam

Artificem, mens nostra cui est conformis, Arachnem,
Quae medio tenera residens in stamine tela

In English thus;

Unto Arachne skilfull Mistresse let us come,
To whom conformed seems the minde of man,
She sits in midst of web, her tender feet upon:

Qua ferit eurus atrox, trepidat volitantibus auris
Tangitur, utque sono vagus illi byssus ab aëstro.

Whiles she is tost with East-winde now and then,
She trembleth at the noyse of rattling winds,
As when the humming Flie hard wagging finds.

Of the Tame or House SPIDER.

Aristotle, that diligent searcher and seeker out of Nature and naturall causes, termeth this kinde of Spider a very gallant and excellent wise creature. King *Salomon* himself, at whose high wisdom all succeeding ages have and will admire, amongst those four small Creatures, which in wisdom do out-strip the greatest Philosophers, reckoneth the Spider for one, dwelling (as he saith) in Kings Courts, and there devising and weaving his inimitable web. The Poets faine that the Spider called *Arachne*, was in times past a Mayden of *Lydia*, who being instructed of *Minerva* in the cunning skill of Embroidery and spinning, grew therein so excellent, and took such a pride in the same, (for you must remember she was a woman) that she stiffly denyed, facing it out in braving wise, that *Minerva* was never her Instructor, and so arrogant presumptuous she was, as that she feared not to challenge her Mistresse Goddesse to work with her, if she durst for her ears enter the list, in all manner of Embroidery, Tapestry-works, and the like.

At which, Mistresse *Minerva* being netled, and taking the matter in dudgeon, thus to be provoked, and withall reprehending the mayd very sharply for her sawcinesse, in a pelting chafe she brake to pieces the wenchs imagery work, that was so curiously woven, and so full of variety, with her shuttle. The Mayd hereat being sore grieved, half in despair, not knowing what to doe, yeelding to passion, would needs hang her self. But *Minerva* taking compassion upon her, would not have her die forth with, but transformed her into a Spider, hanging by a fine small thred or line,

Atque ita vive quidem, pende tamen, improba, dixit,
Lexque eadem pæne, ne sis secuta futuri,
Dicta tuo generi, serisque nepotibus esto.

In English thus;

So live indeed, yet hang, thou woman vile,
She said, and let the self same law of punishment
Be unto thee and all thy offspring, while
All kindred last: shall not futures thee content.

If any be desirous to know more of this fable, let him read the famous Poet *Ovid*, who hath excellently written thereof in the sixth book of his *Metamorphosis*, although somewhat differing from this of *Pliny*. The *Grecians* besides do write, as *Cælius Rodoginus*, in his 7. book *Lectionum Antiq.* Chap. 16. affirmeth, how that there was in the Countrey of *Attica* a certain man called *Phalanx*, who had also a Sister named *Arachne*, and when *Phalanx* had perfectly learned of *Minerva* the Military Science, and all other warlike exercises and offices that belong to a Souldier, and that she had likewise instructed his Sister *Arachne* in weaving, spinning, and needle-work, they concluded a match between themselves, but the Goddesse being much displeased with such a shamefull and incestuous marriage, marring their fashion, she disfigured them both into the number of creeping Creatures, laying this as a just punishment upon them, to be destroyed of their own young ones.

But it is at every mans choice to interpret these to be either fables and *Canterbury* tales, or true historicall narrations: yet most are of this minde, that *Arachne* first invented spinning of linnen, weaving and working with the needle, which this mayd of *Lydia* first learned from the Spiders, taking her first Samplers and patterns from them for imitation; which no man ought to think to be strange, sith the craft of playstering or working things in earth, and the Art of curing the eyes, was first taken from the Swallows. The Eagles have taught us Architecture, and men first received the light of Phlebotomie or letting of blood from the *Hippopotamus*, which is a beast living in the River of *Nilus*, having feet like an Oxe, and his back and mane like a Horse, with a winding tayl, and tusked like a Boar. The bird of *Egypt* called *Ibis*, first gave knowledge to Physitians how to use the Glyster; yea, Dogs, Goats, Harts, Storks, Swallows and Weasels, have taught men many medicines for many diseases.

To begin therefore to make an enumeration of their prayes, I will declare unto you, the rich vertues and externall goods of the body, fortune and minde. And first to begin with the good gifts of their bodies. If you will weigh and consider the matter and substance of a Spiders body, you shall finde it to be light, partaking much of fire and ayr, (being two of the most noble and effectuall elements in operation) and having but little earthy dragginesse and drossy refuse. If you behold their figure, they have either a Sphæricall and heavenly, or at least wise an Ovall form, which is next to the Sphæricall, as being the perfectest of all other. Besides, their substance is thin, fine, glistering, and subtile, yea, although they seem now and then to be fatted up with plenty of meat, that they grow as big in bulk as a Walnut, and if the learned *Cardan* may be credited, they grow otherwhiles as great as a Sparrow: yet for all that, if you cast your eye on them against the light, hanging in their web, she glittereth and shineth on all parts like unto the Chrysolite, which is a kinde of precious stone, shining with a golden colour quite thorow, causing a pleasant reflexion to the eyes, and piercing them with singular delight.

The colour of a Spider is somewhat pale, such as *Ovid* ascribeth to Lovers, and when she hangeth aloft in her web, with her legs wide and large spread abroad, she perfectly and lively expresseth the shape and proportion of a painted Starre: as if nature had intended to give and bestow on her, not onely the resemblance and counterfeit similitude of heaven, but also the very lustre of the Starres themselves. The skin of a Spider is so soft, smooth, exquisite, pure, clean, and neat, that it farre surpasseth by many degrees, the polished skins of those maids that have the Green-sicknesse, or those young whores that are so carefull in sparing no cost to preserve their beauties: and it is of such cleernesse and perspicuity, that it will easily represent the visage and physiognomy of any beholder of it, much like unto a fine glasse. Further, it hath fingers, for all the world such as fair Virgins desire to have, that is to say, long, round, and slender, being also endued with the most exquisite sense of touching that possibly can be imagined, insomuch that it farre surmounteth any mortall man living, and all other creatures in the world besides, according to that old and common Verse;

*Nos aper auditu præcellit, Aranea tactu,
Vultur odoratu, Lynx visu, Simia gustu.*

Which may be Englished thus;

To hear, the Boar, to touch, the Spider us excels,
The Lynx to see, the Ape to taste, the Vulture for the smells.

It hath also feet, but yet not such a multitude as *Scolopendraes* have, nor yet none at all, as the meanest rank and sort of Creatures, nor yet six only, as the common sort of Insects: but it hath eight, a number which the meanest Sophister in *Cambridge* can resolve, is next to the perfectest of all numbers, and these feet consisting of a sesquitertiall proportion, which of all Mathematicians is esteemed to be wonderfull and admirable, so that although the hinder be shorter then the fore-legs, yet notwithstanding they retain a mutuall harmony, equality, and semblable concordance. Many Philosophers have not dared to affirm that they are blinde, but they themselves in this poynt are most

most blinde. For if they be deprived of their eyes and eye-sight, I would faine be resolved how they could make choice of such apt and convenient places for their hunting trade, and with what guide, Captain, or Director, they do knit, fasten and tye one thred to another, in such admirable order, rank and range, as the excellentest work-men in the world stand amazed at. Or else how they can come to the knowledge when their webs are broken by chance, or have the skill to amend them, being either shaken or burst in sunder. Besides, we may all observe by our own experience, that if one take a flie, and hold her at the side of the web, the familiar, tame, or domesticall Spider espying her, will make all the haste she can through thick and thin, yea though she be farre off, and will boldly assaile and devour her, and will (as a man may say) take her out of your hands into her own, which thing I have often seen done. Surely therefore those persons are half blinde, who neither can conceive nor see, that Spiders can see.

Now in that a Spider seemeth to some to be an ugly and loathsome Creature, and even at the first sight to be detested, in regard it is so mishapen, I will not impute this to any defect or default that is in their form or proportion, but I rather ascribe it to their exceeding great Melancholy (for this humour is most predominant in them) and to their strange lusting or longing, by reason of naughty humours gathered about the mouth of the stomach, yea, and to their lack of stay and moderation in their lusts and affections. For they are no lesse beholding to Nature for their elegancy, handsome and proper feature, then the Butter-fly, or any other Cut-waste whatsoever. To conclude this poynt, GOD hath given and bestowed upon this strange and admirable body, as strange and admirable a disposition, nature, and constitution of the skin. For a Spider changeth her skin, not once only in a years space, (as Vipers do) but once in the space of a moneth she reneweth it, (if she be well fed, and not hunger-starved) and putteth on a new hue and skin, and the same in all poynts more fresh, exquisite and neat, then the old skin which she cast off.

Amongst the blessings of Fortune, or rather Fate, I esteeme this to be the excellentest that is conferred upon them, in that they bear about with them an inexhausted matter or substance in their bellies, to make infinite webs, yea, such a matter as can never be consumed, wasted or spent, of which they have such foyson, as they are able to draw out in length and breadth, and to spin and devise innumerable threds and stufte to make and finish their Cob-webs of, so that it a hundred flies light in them, they are of force sufficient so to entangle and ensnare them all, as they shall never get out again. Furthermore, although they have neither food nor sustenance laid up in Barns or Store-houses, as Pismires have, nor yet any meat set or sowed for them as Bees have, but get their commons only by taking of booties casually, by hunting at all adventures, and by chanceable preys, yet do they satisfie nature, and expell hunger, by means of that hazardous and suddain spoyl; and sometimes you shall see them grown very thick, fat, and unwieldy, by reason of these good dishes, and fat messes of meat which they can purchase by their own good wary husbandry, or by any means can lay hold on, and catch into their clawes.

Besides, I must tell you that Spiders have not the least benefit of Fortunes favour bestowed upon them, when as being ingluttred with Courtly Viands, they have been glad to exchange lodgings with an old Courtier called *Podagra*, or the Gout, for it skilleth not whether of these two names you will chuse. For you have heard before, the wise King *Solomon* to have given them the most prime and chiefest places in Princes Courts, that she might be an absolute pattern and president of wit, wisdom, moderate frugality and vertue, and in divers poynts of regiment they might be our directors for imitation. Further, beginning their Cob-webs, they have wholly bent and applied themselves to their most ingenious weaving trade, they have given themselves to curious and superstitious hunting, to captious taking at advantage, watching and espying their prey, nothing at all fearing any ambushes, treacheries, traps or treasons, and no whit dreading any assaults, much lesse triumphs: and to speak briefly, the wisest creature of the wisest King, beareth a great stroke, domineereth, and hath (I may say) the sole sovereignty in the most noble, greatest, and stateliest Courts of Princes.

And yet for all these vertues, (since *Salomons* time) there have risen up and followed some Princes and Governours, unadvised, desperately naught, and unthrifty, and such as were not well in their wits, and of those it cannot easily be spoken how churlishly they entertained her, how they sent out their proclamations and warrants, to expell the Spider, to cast her down to the earth, tread under foot, undoe and kill, as a night-thief, with beesoms, brooms, brushes and long poles, so that by and by in a trice there flocked certain Furies of hell, (for so I think I may justly term them) rubbing, brushing, spunging, making clean fluts-corners, beating and sweeping together, and whatsoever they found curiously wrought, all that either they swept clean away, or tore all to pieces, so that hardly they could escape the busie beesomes of these quick-sighted and lewd naughty packs.

Surely, miserable was her condition and estate, which in all that abundance of wealth, she only being indigent and bare, detesting idlenesse withall, might not yet be admitted tenant for some short term of time, in some small odde corner, in such large and spacious buildings, nor yet finde one hole to live at peace in. Again, the great men, the rich misers and penny-fathers, following the example of their Princes and Governours, they in like sort sent packing out of their doors, the School-mistresse of all labour, diligence and vertue, and will not permit a web, the very pattern, index, and anathema of supernaturall wisdom to remain untouched.

This same Spider which now we treat of, in times past, (it was when Dogs and Cats could speak, for now because there are so many languages in the world, they turn all to plain barking) took a long journey into a strange Countrey, and by good hap fell into company with my Lady *Podagra*, although (being none of the best footers) she could hardly keep way with the Spider, but lagged still behinde, and having now spent one whole day in travell, the night approaching that they should take up their Inne to lodge in, they resolved betwixt them two to betake themselves to sundry houses; so the Spider entring the Town, took up her lodging in the house of a certain wealthy Citizen, (I suppose it was neer the sign of the three Tunnes in *Tower-hill-street*) where when according to her usuall manner, hating lewd idlenesse, she began to buckle her self to her wonted task, in weaving her fine Tapestry, and other wrought work, being suddenly espyed of a company of corner-creepers, Spider-catchers, fault-finders, and quarrell-pickers, they presently begin to expostulate the matter with her, and not staying to hear any reason for her just defence, they made no more adoe but gave her Jack-drummes entertainment, thrusting her out of doors by the head and shoulders, to seek her lodging where she could finde it; so that she lay abroad without doors a whole Winters-night in the rain and cold: and all this happened about Saint *Nicholas* time, when dayes are at the shortest.

Now in the mean space *Podagra* having none of the best feet, but indeed being somewhat lame, when she could travail no further, she by chance light into a poor Cottage or cabbin of turfs, builded with Elder-poles at the Towns end, and yet in this poor shed she could hardly be received, but yet at length, through her incessant solicitation being admitted, she sate down to rest her weary bones, so at length, supper being prepared, the tender-hearted Lady found course fare, and commons farre shorter and more homely, then ever *Lipsius* found in *Westphalia*: she indured all the miseries in the World, that pity it was to see. There was no infelicity, no distresse, misfortune and adversfity to be compared unto hers, for there was nothing but a little brown Barley-bread set on the board to sup withall, which this nice piece so much misliked and abhorred, as that at the very sight thereof she was ready to disgorge her queasie stomach, then was there brought some Cock-crown keal, having no good relish, for they were not seasoned with salt, so that they were in taste very untoothsome, and when they should drink, they fetcht a little cold water out of a pit or pond, neer adjoyning to the house, in a wooden dish, whereof if Mistrresse *Podagra* had fetched but one sound carouse, it would have made her run through an Alphabet of faces: but there was no remedy, hunger breaketh stone-walls, and hard need makes the old wife trot, she must either quench her thirst with that or fast.

Having thus thinly supped, she called for her Chamber, where they shewed her to climbe up a Ladder, (you would have taken it to have been the fleas Ladder) and behinde a corner there was provided a bed stuffed with good Wheat-chaffe in stead of Down, to harden her hide, and under her head a hard Oken-logge, with the Winnow-cloth, and the one end of an old Hop-bag, cast over in stead of a Coverlet, (for the poor man and his wife, thought that none but the Lord of the Town, and women in childe-bed used Pillowes.) But *Podagra* not knowing how to mend the matter, groaned and made a lamentable noyse, and fetching a thousand sighes she couched her self down. But alas what ill rest the poor heart took that night, and how ill her soft and tender limbs agreed with such cold cheer and entertainment, I referre my self to your secret thought. So soon therefore as the day began to break, she started up, and the Spider and she met together again at the appointed time and place: and first of all the Spider began much to complain of the incivility of the rich Chuffe his host the Citizen. *Podagra* contrary-wise found as much or more fault with the short and sharp commons, this diet, miserable poverty, and indigency of his poor, bare and lean host, shewing her black and blew marks and prints, into whose tender skin the boards and planks had made a deep impressiion. For which cause, being both much discontented, after the matter was thoroughly debated betwixt them two, they determined and resolved within themselves, that the night following they would change Hostes and Innes, that is, that the Spider should enter into some poor Cottages, or houses of poor men, and *Podagra* should bend her course unto Noble and great mens houses, to Kings Courts, and Princely Palaces, to see what good was to be done there. So *Podagra* not being unmindfull of her word, went with a fine and Snail-like pace to the house of a certain fat, rich, and well monied man, and quietly laid herself down at the feet of this corsie Sire: which as soon as the gentle Host cast an eye upon, it is strange to tell with what mildeness, with what allurements and gentle intreaty, with what promptitude and alacrity she was welcomed; they prepared soft pallats of Down for her to lye upon, the Bedstedes and the Settles whereon she should rest, were covered with Pillowes, soft Cushions, and Carpets of *Persia*, the Kitchen smokes, and all things are in a readinesse to give her a most friendly wellcome. According to the words of the Poet, where he saith;

Jam dapibus mensas onerant et pocula ponunt.

In English thus;

Spread are the tables, and laded with store

Of delicates, the Cups filled, could receive no more.

Briefly, he was in all points for person and provision such a one as *Chaucer* in his works describeth his *Franklin* to be:

White

White was his beard as the Daisie,
 And of complexion he was sanguine,
 Well loved he by the morrow a sop in wine:
 To live in delight was ever his won,
 For he was Epicures own son,
 That held opinion that plain delight,
 Was very felicity partite.
 An householder and that a great was he,
 Saint Julian he was in his Countree,
 His bread, his ale, was alway after one,
 A better viended man was never none,
 Without bake-meat was never his house,

Of fish and fesh, and that so plenteouse,
 It snewed in his house of meat and drink,
 Of all dainties that men could think,
 After the sundry seasons of the yeer,
 So changed he his meat and his suppere.
 Full many a fat Patrick had he in mue,
 And many a Bream, and many a Luce in stue,
 Woe was his Cooke, but his sawce ever were
 Poynant and sharp, and ready all his gere.
 His table dormaunt in his Hall alway,
 Stood ready covered all the long day.

Nay, hither they brought fat and crammed Capons, Pheasants, Quails, Turtle-doves, Larks, and Nightingals. I passe over Turbot or Byrrt, Gilt-heads, Sturgion, Salmonds, Soals, and the like, for they were not unfurnished of all these, and of other store of shell-fish, as Lobsters, Crevishes, Oysters, and whatsoever the Sea yeelded that might by love or money be purchased: for I will not speak of a great number of River-fish and Fouls that are to be had about Peterborow, Wittlessey-mare, and those Fennish Countreys, for thither he sent his people to purvey for him all that was rare and dainty. Here was Red-wine, White, Claret, Muscadell, Rhenish, sweet-wines, harsh-wines, wine of Falernum, of the Islands of Creta, Chio, Madera, and those that are called Baleares, lying neer unto the Coast of Spain.

To speak nothing of their rear-suppers, their fine Marchpanes, and curious Confections, made with sundry devises, and exquisite skill of the Apothecary. And to conclude, there was no wanton fare unsought for, no delicate Juncate, no curious trimming and pickednesse that might gratifie, no fair words, and pleasant enticements fit to draw and allure, nor no delectation whatsoever omitted, that might seem to please this great Lady Podagra, (for you must understand she was none of the courtiest sort of Ladies, whereof there be many now adaies, for all men know she was a Gentlewoman born, both by the fathers and mothers side, as being the daughter of Bacchus and Venus,) and all this, I say, was done to please both her and her two sweet Sisters, Gbiragra and Congra, a pox take them all three, and so I will let them go, and come to the Spider, who likewise being directed by some favourable Planet, boldly and luckily trudged to the poor mans house.

— Atque ibi miro

Dogmate, quidve marem deceat, deceatque maritam

Addocet, atque suo sese sudore saginat.

Which may be Englished thus;

And there by strange instructions and documents,

She teacheth male and female how to live,

That is, both man and wife how to increase their rents,

Whilst she, on her own sweat and fat doth thrive.

But some man may here object and say, I see here no such great blessings of Lady Fortune, more then besides a bare commendation, and good hap in this their exchange of lodging and lodgers. Yes surely, very much, not only because she spendeth her dayes more freely and safely from danger, but also because as out of a high watch-tower, she no longer beholdeth in the houses of poor persons, lavish and needlesse prodigality, banquettings, quaffings, rioting, playes, dancing, dicing, and whoring, and a thousand vanities and villanies besides, whereof she knew her self conscious, and a privy witness unto, whilst she lived in the Halls and Bowers of the rich and wealthier sort; who when they had thrust clean from house and home, and for ever banished the Spider, (the true School-mistresse of industry and frugality) straightwayes the lazie Gowt called Podagra, arrested them. Had it not been better for them (think you) to have granted a dwelling place to a saving, wise, prudent, and harmlesse little creature, then to have given entertainment to such a base, blockish companion and guest as the Gowt is? Let not therefore, rich, covetous men wonder, if many times they be tormented with this sore grief, sith they will neither admit true Physitian nor physick, I mean, travail, diligence, industry, moderation, and pains-taking, with the like.

Now to touch the rich and rare gifts and graces of the minde, and other noble qualities and dispositions of Spiders, I know not whether I should first begin with the commendation of their prudence, justice, fortitude, temperance, their Philanthropia, Philoponia, Autarkeia, their humanity and love towards men, their studious industry and love of labour, their contentation as having sufficient, and coveting no more then is allotted unto them. Their wittinesse, policy, quickness and sharpnesse of sense, their cleanly neatnesse, with many other vertues, or else her admirable cunning and skilfulnesse in their weaving trade. Their prudence, sagacity, and wittinesse to conjecture things future, appeareth in this one thing, that when great abundance of rain, floods, swelling and overflowings of Rivers, are like shortly to come to passe, and thereby to threaten houses, they then begin to build their Webs higher by a great deal, then their usuall custome heretofore hath been. And this is another proof of the same, in that they weave not at all in a clear Sun-shine-day,

day, or when it is fair and calm weather, when Flies are most busie in flying about to and fro, that they may be the better at leasure to give themselves to hunting and watching after them, to take advantage, and if any chance to light into their nets, forthwith to seize upon them for their repast.

Again, when houses are ready to drop down, they with their Cobwebs first of all fall, and get them away packing, alter their climate to some other surer place and dwelling to rest in. If any thing touch her body that is hard or painfull, she immediately draweth up her legs round on a heap, for this end as I think, to feel the lesse pain, and the better to provide for the health and safety of her head, the director and governor of the whole body: for if any other part be hurt, she can easily cure it. Who hath manifested and made known this unto them? Hath any *Chaldean* Stargazer, or figure-flinger, by the sight and position of the starres shewed it unto them? No certainly. But a divine prudence and forefeeling knowledge, originally inbred by Nature, to eschew that which is hurtfull, which is diffused into the Spider, and as that famous Poet *Virgilius* hath excellently described,

*Spiritus intus alit, totosque infusa per artus
Mens agitat molem.*
In English thus:
*Minde bred within, infused in all limbs,
Minde moves the bodies lump, and skins.*

Furthermore, so soon as they espy their enemy to be caught in their nets, they do not first of all bite and prick him to death in any hostile manner, but they seem with their feet gently and softly to stroke him, yea even to intreat and allure him with tickling, and as it were clipping and colling, untill they have thoroughly insnarled him within their clammy and viscous gins, and being at length wearied, turmoiled, and tired with struggling and striving in vain, the silly Flie is made unable either to get away, stir, or resist. So having made sure work with one, she hyeth her to the center of her Web, observing and prying whether any new prey will come to hand again: so by this policy you shall see sometimes ten, yea otherwhiles twenty Flies hanging aloft by their strings and fine-spun threds.

They only feed on the juice of Flies, and the dry Carcase without any moysture, they cast away as unprofitable stufte to be used about any businesse. Moreover, because the Female Spider is sometimes greater then the Male, therefore she chuseth her standing in the lower part of the Web, that the poor Flies may seem carelesse of her, yet is she very observant, taking great heed to them: for they seeing her hanging below, thinking themselves safe, do fly up into the upper part of the net, but by this means seeking to shun *Charybdis*, they fall into *Scilla*, out of the smoke into the fire: for though in regard of her bodies magnitude, she be unwieldy, and very unfit to bestir her self in this hunting office: yet the crafty Male Spider playing Bo-peep, and pretending some other businesse, though minding another, playing the dissembling Hypocrite, hideth himself in the top of the Web, noting well all occurrents, and being seen of no body, there he lurketh till some fish (as we say) come to his net, and having espyed his prey, being more light, quick, and lively, it is a wonder to see how diligent, vigilant, and earnestly bent he is to bend his course with all expedition toward this new offered booty; for there he will not suffer it very long to remain, but descending in a trice, *Euro velocius*, as quick as a Bee from the upper to the lower part (as I have said) of the Cobweb, he maketh a very quick dispatch, and having royally feasted himself, he reserveth and layeth up all his other enemies in one place, hanging them all by one of his own threds till some convenient time to feast himself again withall. Then again when as by reason of long continuance and length of time, the Webs have lost their binding viscosity, and tenacious substance, either the Spider unweaveth them again, or else confirmeth and new strengthneth them afresh as it were, with another new glutinosity, or fast-binding clamminesse. This their work being finished, they either contain themselves in the center of it, or keeping sentinell and warding in the upper part, they hold as it were in their hands a thred drawn from the middest or center, by which they have easie access and recess to and fro to their beguiling nets; and withall this thred serveth to another profitable use, for if any prey be intangled, by the light moving and stirring of it, they presently feel and perceive it. But yet to make sure work, lest she should winde down in vain, or take bootlesse labour about nothing, she draweth back the thred a little now and then, and by the motion and poize of it, she putteth all out of doubt, being fully ascertained of the truth.

Then first, with all celerity possible she hies her to the Center, which thing the silly Flies being fast, and having some sense and feeling (as it should seem) that they are taken tardy, and for deeming some hurt, are as quiet as a Mouse in a trap, making no noyse at all, lest either they might betray or betray themselves, and so be further enfolden in danger. But alas in vain doth he avoyd warre, that cannot enjoy peace, and bootlesse doth he shun pain, that hath no means to feel rest: for this availeth but little, for they are not able with all these fetches to deceive their sharp inquirers, for both with eyes and feet, they finely and quickly run unto them, making a clean riddance and quick dispatch of them every one.

But yet it is more to consider what great justice and equity is observed to be in Spiders: For there is not one of them so ill bent, so malapertly sawcy, and impudently shamelesse, that can be seen to lay

lay claim unto, or to take away anothers wife or mate: there is none that intermedleth with anothers substance, businesse, or weaving; every one liveth contented by the sweat of his own browes, by their own proper goods and industrious pains-taking procured by their own bodily labour: so that not one of them dare enter his Neighbours freehold, but it is accounted a hainous matter, and very unlawfull, not one dare be so knock-hardy as to break into their friends and fellowes fence and enclosure, but it is even detested as a wicked and cursed deed.

*Non ita mortales, quos (proh dolor) urget habendi
Tantus amor, domibus domus, arvis additur arvum,
Monticulus monti, maribus mare, sique potessint
Addiderint mundum mundo, suaque omnia dixint.*

In English thus;

*Then would not mortall men so farre engag'd in love to have
(A death it is to think) house to house, and land to land to lay,
Hillock to hill, sea unto sea, to adde they crave,
And if they could, world unto world, and all their own would say.*

Again, they spread not their gins and nets to entrap and deceive good Creatures, and such as serve for mans use and benefit, but for Wasps, Horse-flies, or Gad-bees, and Brimsees, or Oxe-flies, that in Summer-time vexe Cattle, for Drones Gnats, and other Flies, which to us are like to Theeves, Parasites, Bawds, Panders, and such Merchants that bring whores and knaves together, being *Telluris inutile pondus*, an unprofitable burthen of the earth, serving to no good use. And besides, being a vermin of singular and incomparable courage, she dare adventure to give the onset upon those young Serpents that are called *Lizzards*, who if they offer to contend and strive against her fury, she quickly enclaspeth them round about, and very nimbly and eagerly seizeth upon both their lips, biting and holding them together so fast, that she never giveth over till they be dead: and at length having vanquished her enemies, she like another *Caem* carrieth them into her Cave, or some secret corner.

Now if it happen in this hot bickering, that the nets be either broken, intangled, or platted together, by and by without further delay she falls to mending what was amisse, to unwind, spread open, and to set them again in due order and frame very ingeniously. What say you to this? That the Spider beareth a deadly feud and mortall hatred to Serpents: for if so be the Serpent at any time lie in the shadow under any tree to cool himself, where Spiders do resort, some one of them levelleth directly at him, descending down perpendicularly to the Serpents head, and with such a violence striketh and dasheth at his head with her beak or snout, that her enemy withall making a whizzing noyse, and being driven into a giddinesse, turning round, hisseth, being neither able to break asunder the thred that cometh from above, nor yet hath force enough to escape it. Neither is this spectacle or pageant ended, untill this our champion with her battering, hath sent her life to *Pluto*, the God of Hell for a present. Let men therefore be silent, and cease wondering at the amphitheatricall fights of the *Romans*, which were made with seats and scaffolds to behold Playes and fights, and where were presented to the Spectators the bloody fights of Elephants, Bears, and Lions, sithence a small Spider dare challenge to the field, and fight hand to hand with a black and blew Serpent, and not only to come down to him in daring wise, but also victoriously to triumph over him, entirely possessing all the spoyle. Who would not marvel that in so small, or in a manner no body at all, which hath neither bones, nor sinewes, nor flesh, nor scarce any skin, there could be so great force, such incredible audacity and courage, such sharp and hard birings, and invincible fury? Surely we must conclude necessarily, that this cannot proceed altogether from their valiant stomacks, but rather from *GOD* himself: In like sort, they dare buckle with Toads of all sorts, both of the land and water, and in a singular combate overthrow and destroy them, which thing not only *Pliny* and *Albertus* do recite and set down for a certain truth, but *Erasmus* also in his Dialogue entituled *De Amicitia*, maketh mention of, reporting how a certain Monk lying fast asleep, on whose mouth a foul Toad sate, and yet by the Spiders means was freed from all hurt. Yea, they dare enter the combat with winged and stinged Hornets, having not soft but stiffe bodies, and almost as hard as horn, who although she many times breaketh through their Cobwebs with main strength (as rich men undoe and make a way through Lawes with Gold, and by that means many times scape scot-free) yet for all that, at length being over-mastered, hand to hand in single combat, and intangled and insnarled with the binding paltinesse, and tenacious glewish substance of the Web, she payeth a dear price for her breaking into anothers house and possession, yeelding at length to the Spiders mercy.

I will not omit their temperance, a vertue in former ages proper only to men, but now it should seem peculiar to Spiders. For who almost is there found (if age and strength permit) that contenteth himself with the love of one as he ought, but rather applyeth his minde, body, and wandering affections to strange loves? But yet Spiders so soon as they grow to ripenesse of age, do choose them Mates, never parting till death it self make the separation. And as they cannot abide Corrivalls, if any Wedlock-breakers, and Cuckold-makers dare be so snappish to enter, or so insolently proud as to presse into anothers house or Cottage, they reward him justly

with condigne punishment for his temerarious enterprize, and flagitious fact: First by their cruel bitings, then with banishment or exile, and oftentimes with death it self. So that there is not any one of them, that dare offer villany or violence to anothers Mate, or seek by any means unlawfully to abuse her. There is such restraint, such strict orders, such faithfull dealing, uprightnesse of conscience, and Turtle love amongst them. Further, if you look into their house-keeping, you shall finde there is nothing more frugall then a Spider, more laborious, cleanly, and fine. For she cannot abide that even the least end or piece of her thred to be lost, or to be placed and set to no use or profit, and they ease and relieve themselves by substitutes, that supply their rooms and take pains for them: for whilest the Female weaveth, the Male applyeth himself to hunting, if either of them fall sick and be weak, then one of them doth the work of both, that their merits and deserts may be alike. So sometimes the Female hunteth whilest the Male is busie about Net-making, if the one stand in need of the others help and furtherance.

But yet commonly the Female-Spider being instructed of her Parents when she was young and docible, the art of spinning and weaving (which custome was amongst us also in times past) beginneth the Cobweb, and her belly is sufficient to minister matter enough for such a piece of work, whether it be that the nature or substance of the belly groweth to corruption at sun-set and appointed time (as *Democritus* thought) or whether there be within them a certain lanigerous fertility naturally as in Silk-worms. *Aristotle* is of opinion, that the matter is outward as it were a certain Shell or pill, and that it is unwound, loosened, and drawn out by their fine weaving and spinning. But howsoever it be, certain it is, they will not by their good wills lose the least jot of a threds end, but very providently see to all though never so little. The love they bear to their young breed is singular, both in the care they have for their fashioning and framing to good orders, and for their education otherwise, for the avoidance of idlenesse. For the Male and Female do by turns sit upon their Egges, and so by this way interchangeably taking courses, they do stirre up, quicken, move and encrease naturall and lively heat in them, and although it hath been sundry times observed, that they have brought forth three hundred young ones at once, yet do they train them up all alike without exception, to labour, parsimony, and pains-taking, and inure them in good order, to fashion and frame all things fit for the weaving craft. I have often wondred at their cleanlinesse, when to keep all things from nastinesse or stinking, I have beheld with mine eyes those that were lean, ill-favoured, and sickly, to come glyding down from the upper to the lower part of their buildings, and there to exonerate nature at some hole in the Web, lest either their shop, work-house, or frame might be distained or annoyed. And this is sufficient to have spoken of their politicall, civil, and domesticall vertues: Now will I proceed to discourse of their skill in weaving, wherewith *Pallas* was so much offended: for the Scholar excelled her Mistres, and in fine, cunning, and curious workmanship, did farre surpass her. First then let us consider the matter of the Web, whose substance is tough, binding, and glutinous, pliant, and will stick to ones fingers, like Bird-lime; and of such a matter it is compounded, as it neither loseth his clamminesse and fast-holding quality, either by siccity or moysture.

The matter whereof it is made, is such as can never be consumed, wasted, or spent, whilest they live, and being so endlesse, we must needs here admire and honour the never ending and infinite power of the great God: for to seek out some naturall reason for it, or to ascribe it to naturall causes, were in my minde meer madnesse and folly. The Autumnall Spiders, called *Lupi* or *Holci*, Wolves or Hunters, are thought to be the most artificiall and ingenious: For these draw out a thred finer and thinner then any Silk, and of such a subtilty, that their whole Web being folded together, will scarce be so heavy as one fine thred of Linnen being weighed together. *Edwardus Monimus* hath very finely and eloquently described both the Males and Females, *Heptam. lib. 7.* in these words following;

—Ille domum venatu pascit, at ista
Mæonio graciles orditur tegmine telas.
Stanniparus venter, vomifilus lanifer, ipsi
Palladiam cumulatque colum, calatosque ministrat.
Ipsius est fusum pondus, quod fila trabendo
Necit & intorquet parili sub tegmine ducta.
Illa suam à mediis orditur Dædala telam,
Et gracili tennes intendit stamine tractum.
Tela jugo juncta est, stamen secernit arundo,

Inseritur medium radiis subtegmen acutis,
Atque oram à centro panum sibi staminat illam,
Pervia tela patet gemina de parte, feroci
Ne concussa euro frangantur stamina, quoque
Musca volax tenui streitur sinuamine cassis,
Reticuli primam vix muscula contigit oram.
Mors abit in tela centrum, ut discrimine parvo
Vinciat ipse suo peregrinam casse volucrem.

Which may be Englished thus;

The Spider-male by hunting game the houses charge doth feed,
The female with Mæonian art begins to spin fine thred,
Out of Web-breeding belly, breast woolly, upcasting twine,
Whereto the distaffe she applies by art of *Pallas* fine:
To her belongs the pressed weight, which doth the teal out-draw,
Both matter, art, and substance, she doth shield by natures Law.
Like *Dædala* out of her middest, her web she doth begin,
And stretching out her tender worke, by pressing it full thin:

*The which is joyned as in yoke, yet parted by a cane,
And planted is the middle roof in a sharp beamy frame.
And from the Center draweth a thred like wooll to lye upon,
While double work on every part doth fortifie her wone:
Wherewith the blasts of Eastern winde unbroken web resists,
And tender fly insnarled, is fallen into those lists.
While scarce upon the edge or brim this little Flie doth fall,
But by and by death seizeth her within webs center thrall:
And so the stranger winged Flie with little or no ado,
She overcometh speedily when it the nets comes to.*

Of these Cobwebs there is great diversity, variety and difference: for some of them are loose, weak, slack, and not well bound: other contrary-wise well compacted, and close couched together, some triangular, othersome quadrangular; and some are made with all sides equall, but yet not right angled or cornered like a quarry of Glasse; others are made of such a form as will best fit the place where they hunt, you shall perceive some of them to be orbicular, if they weave between two trees, and you shall finde this fashion also among weeds, and oftentimes in Windowes hanging together with many lines and different crosse pieces: so that herein no man can deny but that they shew forth great reason, wisdom, admirable judgement, and much gallant beauty worthy to see to.

Surely *Euclides* that famous Geometrician, who was Scholar to *Socrates*, and lived in the time of *Ptolemy* the first, need not be ashamed to learn from Spiders the drawing of divers of his figures and Geometricall proportions. And Fisher-men also from them have been glad to learn the trade of Net-making. For from whom else could they borrow and fetch such lively representations, and such expresse patterns, then from such a skilfull and industrious School-master. But the strength of the web seemeth to be very strange, which although it seemeth to be the most weak of all other things, yet we see it is able to hold Hornets, and to endure the furious blatts of raging windes, and if one throw or cast dust upon it, the same will rather be distended and stretched, then either undone, broken, or felled down.

And yet this is the strangest of all, which many a man would think impossible but that it cannot be called in question, in regard we may daily see and observe the proof thereof cometh to passe, that a Spider should begin to place the one end of her thred on the one side of a little River or Brook, and how she should fasten the other end on the other side of the water, considering that Nature never taught them the art either of flying or swimming. I would fain be resolved of this scruple, by what means they sayt and passe over. Or do you imagine that they jump over, or convey themselves over in a leap? Surely I dare not say so, I much doubt thereof, I will not stand to it.

The next that best deserveth to be marshalled in the second rank and place, for cunning work in weaving and spinning, be those kinde of Spiders who build and labour about the rafters of Houses, in Cellars, floors, and about boards, planks, and such like, and of these some are wilder, which do fashion and dresse a broad, thick, and plain web in the grasse and fields all about, stretching out the same like a sayl, or some fine spread Sheer or Curtain.

If you would duely look into their work, and thoroughly consider the strange trydles of their Looms, the Shittles they use, their Combes to make all clean, the stay of their Looms wherewith they dresse their Webs, their Crosse-lines, the frame, Wouf, their fine spinning-stuffe, and so their whole Cobwebs, you shall therein very plainly behold the finger of God working in his poor and weak Creatures. And questionlesse in this excellent mystery they are able to put down, and farre surmount the Egyptians, the Lydians, *Penelope*, *Tanaquil* (who was Wife to *Tarquinius Priscus*) *Amestris* that famous Queen of Persia, *Claudiana*, *Sabina*, and *Julia*, Noble Roman Ladies, and all the Queens of Macedonia, who were esteemed and renowned throughout the whole world, to be the most curious and exquisite in this kinde of faculty, and who in needle-work, Tapestry, and all Embroidery, were thought to be Peerlesse. For these Spiders (even contrary to all reason and Art, as we think) make a firm, strong, and well compacted Web with no lines or threds drawn crosse-wise or overthwart, but only made out and continued still in length. When their work is perfected and brought to an end, they lay over it and cover it round about with a certain glutinous kinde of Jelly, or slimed juice, by touching of which their prey being entangled, pay full dearly for their ignorant rashnesse, unadvised heed-taking, and lack of fore-sight. Their Web is of the colour of the air, or rather none at all, which easily deceiveth the foolish unwary Flies, and such as be quick-sighted, circumspect, and can espy things very quickly. For if it did represent any notorious and manifest colour, they would provide in time against such dangerous devises, and take heed of such traps aforehand.

The baser and vilder sort of Spiders, and such as be least reputed of, are those that live in holes, Caves, and corners of Houses, and these in respect of the former are slow, slothfull, and lazy, fat, grosse, and big-bellied corner-crawlers, and these spin a very homely, rough, and course thred, which they spread abroad, and set before the hollow places and chinks of Walls. These Kindes of Spiders have a more heavy and ponderous body, shorter feet, and more unhandsome

to work or finish any Webbes in their Looms, and as for separating, dividing, picking, carding, or futing their stufte, they are very Bunglers to the first mentioned.

They apprehend and take their preyes rather casually, then take any great pains to seek farre for it, because their hole being great outwardly, seemeth to be a good and convenient lurking-corner, and a safe corner for Flies to hide themselves in: but being entangled and arrested in the very entry, they are snatched up suddenly by the watchfull Spider, and carryed away into the more inward places of their dens, there to be slaughtered. For they watch and ward aloft in high walls and buildings, as well to deceive such Birds as lye in wait to intrap and take them at unawares, (as Sparrowes, Robin-red-breasts, Wrens, Nightingales, and Hedge-Sparrowes, which are all sworn enemies to Spiders: and besides, the more easily to beguile the silly flies suspecting no harm at all.

There be certain other sorts of Spiders, which as yet I have not described: as for example; there is one (the greatest of all that ever I saw) which spreadeth her artificiall nets in the Harvest-time amongst the leaves and branches of Roses, and entangleth either any other little Spider that is running away, or else Gnat-flies, and such like, being caught at unawares, and hanged by a kinde of thred, whom she first pursueth and layeth hold on with a wonderfull dexterity and quicknesse: and being fast hanged, and so made sure, she there leaveth them, for the satisfying of her hungry appetite till another time. The body of this Spider is in colour somewhat whitish, resembling scumme or frothy some, and almost of an Oval-figure, the head very little, placed under her belly, being withall crooked or bending like hooks, as is to be seen in the Crab-fish, and her back garnished with many white spots.

This is one kinde of *Autumnall-Lupi*, or Wolf-Spider, which in a very short space of time do grow from the bignesse of a little Pease, to a very great bulk and thicknesse. There are also found in all places of this Countrey, long-legged Spiders, who make a very homely and disorderly Web. This kinde of Spider liveth altogether in the fields, her body is almost of a round figure, and somewhat brownish in colour, living in the grasse, and delighting in the company of Sheep: and for this cause I take it, that we *English* men do call her a Shepherd; either for that she keepeth and loveth to be among their flocks, or because that Shepherds have thought those grounds and feedings to be very wholesome wherein they are most found, and that no venomous or hurtfull creature abideth in those fields where they be: And herein their judgement is to be liked, for they are indeed altogether unhurtfull, whether inwardly taken, or otherwise outwardly applyed; and therefore because I am tyed within a Teather, and thereby restrained from all affectionate discourfing or dilating unlesse of poysonous and harmful Creatures, I will come into my path again, and tell you of another certain black Spider, that hath very short feet, carrying about with her an Egge as white as Snow under her belly, and running very swiftly: the Egge being broken, many Spiders creep forth, which go forth with their dam to seek their living al together, and climbing upon her back when night approacheth, there they rest, and so they lodge.

In rotten and hollow trees there are also to be found exceeding black Spiders, having great bodies, short feet, and keeping together with Cheeselips or those creeping vermine with many feet, called of some *Sowes*. We have seen also (saith the learned *Gesner*) Spiders that were white all over, of a round compact and well knit body, somewhat broad, living in the flowers of Mountain Parsely, amongst Roses, and in the green grasse: their Egges were little, slender, and very long, their mouth speckled, and both their sides were marked with a red line running all alongest. He took them to be very venomous, because he saw a Marmoset or Munkey to eat of them, and by eating thereof hardly to escape with life, yet at length it did well again, and was freed from further danger, only by powring down a great deal of Oyl into his throat. I my self have also seen some Spiders with very long bodies and sharp tayls, of a blackish or dark red colour, and I have noted other some again to be all over the body green-coloured. I will not deny but that there are many other sorts of Spiders, and of many more different colours, but I never read, or yet ever saw them: *Neque enim nostra fert omnia tellus*, The ages ensuing peradventure will finde more.

I will only put you in remembrance of this one thing worthy to be observed, that all weaving and Net-making Spiders, according as they grow in years, so do they acquire more knowledge, and attain to greater cunning and experience in their spinning trade: but carrying a resolute and ready will to keep both time and measure with that Musick which best contents most ears, I will now pass to speak of the propagation and use of Spiders, and so I will close up this discourse.

The propagation of Spiders for the most part is by coupling together, the desire and action whereof continueth almost the whole Spring-time, for at that time by a mutuall and often drawing, and easie pulling of their Web, they do as it were wooe one another, then approach they neerer together, and lastly are joyned with their hippes one against another backwards as Camels do, for that is the most fit for them, in regard of the round proportion and figure of their bodies. In like sort do the *Phalangies* joyn together, and are generated by those of the same kinde, (as *Aristotle* saith:) But the *Phalangies* couple not in the Spring-season, as the other Spiders doe, but towards Winter, at what time they are very swift, quick, nimble, and of most certain hurt, more dangerous, and more venomous in their bitings. Some of them after their coupling together, do lay one Egge only, carrying it under their belly, it is in colour as white as Snow, and both Male and Female sit upon it by turns.

Some Spiders do exclude many little Egges very like unto the seeds of Poppy, out of which it hath been observed, that sometimes there have been hatched three hundred Spiders at one time, which after their vain and idle plying and sporting together in their web, at length come forth with their Dam, and towards evening they all trudge home, until each one hath learned, and perfectly attained to the skill to spin his own web, that therein he may spend the residue of his days in more pleasure, ease and security. They make exclusion of their young breed in hopping or skipping-wise, they sit on their Egges for three days space together, and in a moneths space their young ones come to perfection. The domestical or House-spider, layeth her egges in a thin web, and the wilde-spider in a thicker and stronger, because they are more exposed to the injuries of windes, and lie more open to the rage and fury of storms and showers.

The place and Countrey where they are, helpeth much, and is very available to their generation. There is no Countrey almost, but there are many Spiders in it. For in the Countrey about *Arrha*, which is in *Arabia felix*, there is an infinite number of them to be found, and all the Island of *Candie* swarmeth with *Phalangies*. *Strabo* saith, that in *Ethiopia* there be a great number of *Phalangies* found, of an exceeding bignesse: although as *Pliny* saith in his eight Book and 58 chapter, there are neither Wolves, Foxes, Bears, nor no hurtful creature in it: and yet we all know that in the Isle of *Wight* (a member of *England*;) the contrary is to be found, for although there were never dwelling in it Foxes, Bears, nor Wolves, yet there be Spiders enow.

The Kingdom of *Ireland* never saw Spiders, and in *England* no *Phalangies* will live long, nor yet in the Isle of *Man*, and neer unto the City of *Grenoble*, in that part of *France* which lyeth next *Italy*, *Gaudentius Merula* saith, there is an old Tower or Castle standing, wherein as yet never any Spider hath been seen, nor yet any other venomous creeping creature, but rather if any be brought thither from some other place, they forthwith die. Our Spiders in *England*, are not so venomous as in other parts of the world, and I have seen a mad man eat many of them, without either death or deaths harm, or any other manifest accident or alteration to ensue. And although I will not deny, but that many of our Spiders being swallowed down, may do much hurt, yet notwithstanding we cannot chuse but confesse, that their biting is poysonlesse, as being without venom, procuring not the least touch of hurt at all to any one whatsoever; and on the contrary, the biting of a *Phalangie* is deadly.

We see the harmlesse Spiders almost in every place, they climb up into the Courts of mighty Kings, to be as it were myrrors and glasses of vertue, and to teach them honest prowesse and valiancy. They go into the lodgings, shops and Ware-houses of poor men, to commend unto them contentment, patience, labour, tolerance, industry, poverty and frugality. They are also to be found in rich mens chambers, to admonish them of their duties. If you enter into your Orchard, they are busie in clothing every Tree; if into the Garden, you shall finde them amongst Roses; if you travail into the field, you shall have them at their work in hedges, both at home and abroad, whithersoever you bend your course, you cannot chuse but meet with them, lest perhaps you might imagine, or else complain and finde some faults, that the Schoolmistresse and perfect president of all vertue and diligence were in any place absent.

Who would not therefore be touched, yea and possessed with an extream wonder at these vertues and faculties, which we daily see and behold with our eyes. *Philes* hath briefly and compendiously described their nature, properties, inclinations, wit and invention in his *Greek* verses, which being turned into *Latine*, sound to this effect.

*Araneis natura per quam industria est,
Vincens puellarum manus argutias.
Nam ventris humores supervacaneos
Ceu fila nent, textoris absque pestine
Et implicantes orbium volumina,
Adversa sublegunt iis subtegmina:
Sed liciis hinc densioribus plagas
In aere appendunt, nec unde conspicor
Sejuncta cum sit omnis a medio basis
Que fulciat mirabilem operis fabricam.
Et staminum fallit ligamen lumina*

*Subtilitatis sub dio discrimine.
Firmatur autem densitas subtegminis,
Raras in ambientis oras aeris.
Muscis, culicibus, & id genus volantibus
Intensa nebens fraudulententer retia.
Quod incidit, jejuna pascit hoc famem,
Vitamq; degit haud quietis indigam.
Suspensa centro, cassibusque providens,
Ne fila rumpat, orbiumque dissuat
Nexus retortos flaminis vis irruens.*

Which may be Englished thus;

Industrious nature Spiders have,
Excelling Virgins hands of skill,
Superfluous humors of bellies save,
And into webs they weave them still,
And that without all Weavers combs
Their folding orbes inrolled are,
And underneath their woofs as tomes,
Are spread the worthy work to bear,
And hang their threads in air above,
By plagues unseen to the eye of man,
Without foundation you may prove
All their buildings firmly stand:

Nor yet clear light to the eyes most bright
Can see the coupling of their thread,
The thinnesse of the woof in sight,
On pins of air are surest spread.
On Gnats and silly winged Flies,
Which guilefully in nets they take,
They feed their fill when they espy,
And yet their life much rest doth make.
They labour too, and do provide
Gainst windes and things that break their walls,
That bands from tacklings may not slide,
When greater strength doth them assail.

And

And although *Minerva* hath nick-named the Spider, calling her malepert, shamelesse, and sawcie; *Martiall*, wandring, straying and gadding; *Claudianus*, rash, presumptuous, and adventurous; *Politianus*, hanging and thick; *Juvenal*, dry; *Propertius*, rotten; *Virgil*, light; and *Plautus*, unprofitable and good for nothing: yet it is clear, that they were made to serve and stead us, to many excellent uses: so that you may plainly gather and perceive, that this is rather an amplification, then any positive or measured truth, concerning the fond Epithets, vile badges and liveries, which these rehearsed Authors have unworthily bestowed on them, as by that which followeth may plainly be seen.

Their use.

The Spider put into a linnen clowt, and hung upon the left arm, is an excellent medicine to expel a Quotidian Ague, as *Trallianus* saith: and yet it will be more effectual if many Spiders be boyled with Oyl of Bay to the consistence of a liniment, to anoynt the wrists and the temples a little before the fit, for by this means the Feaver will be absolutely cured, or will seldom return again. *Kirapides*. A Spider tempered and wrought up with Milt-wast or *Ceterach*, and so spread upon a cloth to be applyed to the temples, cureth the fits of a Tertian Feaver. *Dioscorides*. The Spider that is called a Wolf, being put into a quill, and so hanged about the neck performeth the same effect, as *Pliny* reporteth. The domestical Spider, which spinneth and weaveth a thin, a white, or a thick web, being inclosed in a piece of leather, or a Nut-shel, and so hanged about the neck, or worn about the arm, driveth away the fits of a Quartain Feaver, as both *Dioscorides* and *Fernelus* have thought. For the pain in the ears, Take three live Spiders, boyl them with Oyl upon the fire, then distil or drop a little of this Oyl into the pained ear, for it is very excellent, as witnesseth *Marcellus Empiricus*. *Pliny* steepeth them in Vinegar and Oyl of Roses, and so to be stamped together, and a little thereof to be dropped into the pained ear with a little Saffron, and without doubt, saith he, the pain will be mitigated, and the same affirmeth *Dioscorides*. Or else strain out the juyce of Spiders, mixing it with the juyce of Roses, and with some wooll dipped in the same liquor, apply it to the ear.

Sorastus in his Book *peri Dakeon* writeth, how that the Spider which is called *Cranocalaptes*, being stifled or choked in Oyl, is a very present help against any poison taken inwardly into the body, as the Scholiast of *Nicoander* reporteth. There be some that catch a Spider in the left hand, and bear and stamp it with the Oyl of Roses, putting some of it into the ear, on the same side the tooth aketh, and as *Pliny* telleth us, it doth exceeding much good. Spiders applyed and laid upon their own bitings, or taken inwardly into the body, do heal and help those hurts themselves procured.

What should I talke of the white spots of the eyes, a most dangerous grief? and yet are they clean taken away with very small labour, if so be one take the legs, especially of those Spiders which are of the whiter sort, and stamping them together with Oyl, do make an Ointment for the eyes. *Pliny*. The moist juyce that is squeezed out of a house Spider, being tempered with Oyl of Roses, or one dram of Saffron, and a drop or two thereof dropped into the eyes, cureth the dropping, or watering of them, by means of a rume issuing out thereat, or else the moisture of a Spider or his urine being taken by themselves, laying a little wooll on the top of the part affected, worketh the same effect; whereby you may well understand, that there is nothing in a Spider so vile, homely, or sordidous, that doth not some good, and serveth to some end.

Against the suffocation of the belly, *Aetius* doth counsel to apply a *Cerote* to the navel made of Spiders, and saith that he hath found it to prevail much in this kinde of passion. *Pliny* saith, but he yeeldeth no reason for it, that Spiders help the pain and swelling of the Spleen. He writeth also further, that if a man catch a Spider, as she is gliding and descending downwards by her thread, and so being crushed in the hand, and then applyed to the navel, that the belly will be provoked to the stool, but being taken as she is ascending, and applyed after the same former manner, that any loosenesse or flux is stayed, and restrained thereby. The same *Pliny* also writeth, that if a man take a Spider, and lay it upon a Fellon; (provided that the sick patient may not know so much,) that within the space only of three days, that terrible and painful grief will be clean taken away. And besides he affirmeth that if the head and feet of a Spider be cast away, and the rest of the body rubbed and bruised, that it will thoroughly remedy the swelling in the fundament, proceeding of inflammation.

If any be vexed with store of Lice, and do use a suffumigation made only with Spiders, it will cause them all to fall and come away, neither will there afterwards any more breed in that place. The fat of a Goose tempered and mixed with a Spider and Oyl of Roses together, being used as an Ointment upon the breasts, preserveth them safely, as that no milk will coagulate or curdle in them after any birth. *Anonymus*. Yea, that same knotty scourge of rich men, and the scorn of Physitians, I mean the Gowt, which as some learned men hold can by no means be remedied, yet feeleth mitigation and diminution of pain, and curation also, only by the presence of a Spider, if it be taken alive, and her hinder-legs cut off, and afterward inclosed in a purse made of the hide of a Stag. Moreover, we see, (which all other medicines can never do) that all they are freed for the most part, both from the Gowt in the legs and hands, where the Spiders are most found, and where they are most busie in working, and framing their ingenious devised webs. Doubtlesse, this is a rare miracle of nature, and a wonderful vertue, that is in this contemptible little creature, or rather esteemed to be so vile, abject, and of no estimation. Rich men were happy indeed, if they knew how to make use of their own good.

Antonius Pius was wont to say, that the sharp words, witty sayings, quirks and subtilties of Sophisters, were like unto Spiders webs, that contain in them much cunning Art, and artificial conceit, but

but had little other good besides. If any one be newly and dangerously wounded, and that the miserable party feareth a bleeding to death, what is a more noble medicine, or more ready at hand, then a thick Spiders web, to binde hard upon the wound, to stay the inordinate effusion of blood? Questionlesse, if we were as diligent and greedy to search out the true properties and vertues of our own domestical remedies, which we would buy of others so dearly, we would not enforce our selves with such eager pursuit after those of forain Countries, as though things fetcht far off, were better then our own neer at hand; or as though nothing were good and wholesome, unlesse it came from *Egypt, Arabia, or India*. Surely, unlesse there were some wilde worm in our brains, or that we were bewitched and possessed with some fury, we would not so far be in love with forein wares, or be so much besotted, as to seek for greedy new physick and Physical means, considering that one poor Spiders web will do more good, for the stanching of blood, the curation of ulcers, the hindering of fancies, slime, or slough to grow in any sore, to abate and quench any inflammations, to conglutinate and consolidate wounds, more then a Cart-load of Bole fetcht out of *Armenia, Sarcocolla, Sandaracha*, or that earth which is so much nobilitated by the impress of a seal, and therefore called *Terra Sigillata*, the clay of *Samos*, the dirt of *Germany*, or the loam of *Lemnos*. For a cobweb adstringeth, refrigerateth, foldereth, joyneth, and closeth up wounds, not suffering any rotten or filthy matter to remain long in them.

And in regard of these excellent vertues and qualities, it quickly cureth bleeding at the nose, the Hemorrhoids, and other Bloudy fluxes, whether of the opening of the mouths of the veins, their opertions, breakings, or any other bloudy evacuation that too much aboundeth, being either given by it self alone in some Wine, either inwardly or outwardly, or commixed with the Bloud-stone, *Crocus Martis*, and other the like remedies fit for the same intentions.

The cobweb is also an ingredient into an unguent which is made by Physitians, against the disease called *Serpego*, and being bound to the swellings of the fundament, if there be inflammation joynd withall, it consumeth them without any pain, as *Marcellus Empiricus* testifieth. It likewise cureth the watering or dropping of the eyes, as *Pliny* reporteth, and being applyed with Oyl, it consolidateth the wounds of the joints: and some for the same intent, use the ashes of cobwebs, with fine meal and white Wine mixed together.

Some Chirurgeons there be that cure Warts in this manner; They take a Spiders web, rolling the same up on a round heap like a ball, and laying it upon the Wart they then set fire on it, and so burn it to ashes, and by this way and order the Warts are eradicated, that they never after grow again. *Marcellus Empiricus* taketh Spiders webs that are found in the Cypresse tree, mixing them with other convenient remedies, so giving them to a podagrical person for the asswaging of his pain. Against the pain of a hollow tooth, *Galen* in his first Book *De Compos. medicam. secundum loca*, much commendeth, (by testimony of *Archigenes*) the Egges of Spiders, being tempered and mixed with *Oleum Nardinum*, and so a little of it being put into the tooth. In like sort *Kiramides* giveth Spiders egges for the curation of a Tertian Ague. Whereupon we conclude with *Galen*, in his Book to *Piso*, that Nature as yet never brought forth any thing so vile, mean, and contemptible in outward shew, but that it hath manifold and most excellent and necessary uses, if we would shew a greater diligence, and not be so squeamish as to refuse those wholesome medicines which are easie to be had, and without great charges and travail acquired.

I will add therefore this one note before I end this discourse, that Apes, Marmosets or Monkies, the Serpents called Lizards, the Stellion, which is likewise a venomous Beast like unto a Lizard, having spots in his neck like unto stars: Wasps, and the little beast called *Ichneumon*, Swallows, Sparrows, the little Titmouse, and Hedge-sparrows, do often feed full savourly upon Spiders. Besides, if the Nightingale, (the Prince of all singing Birds) do eat any Spiders, she is clean freed and healed of all diseases whatsoever.

In the days of *Alexander the Great*, there dwelled in the City of *Alexandria* a certain young maid, which from her youth up, was fed and nourished only with eating of Spiders, and for the same cause the King was premonished not to come neer her, lest peradventure he might be infected by her poysonous breath, or by the venom evaporated by her sweating. *Albertus* likewise hath recorded in his writings, that there was a certain noble young Virgin dwelling at *Colen* in *Germany*, who from her tender years was fed only with Spiders. And thus much we English men have known, that there was one *Henry Lilgrave*, living not many years since, being Clerk of the Kitchen to the right Noble *Ambrose Dudley* Earl of Warwick, who would search every corner for Spiders, and if a man had brought him thirty or forty at one time, he would have eaten them all up very greedily, such was his desirous longing after them.

of the STELLION.

They are much deceived that confound the green Lizard, or any other vulgar Lizard, for because the Stellion hath a rustie colour: and yet (as *Matthiolus* writeth) seeing *Aristotle* hath left recorded, that there are venomous Stellions in *Italy*, he thinketh that the little white Beast with stars on the back, found about the City of *Rome*, in the walls and ruines of old houses, and is there called *Tarantula*, is the Stellion of which he speaketh, and there it liveth upon Spiders. Yet that there is another and more noble kinde of Stellion, anciently so called of the learned, shall afterward appear in the succeeding discourse.

This

This Beast or Serpent is called by the *Grecians*, *Colotes*, *Ascalobtes*, and *Galeotes*, and such a one was that which *Aristophanes* saigneth from the side of a house eased her belly into the mouth of *Socrates* as he gaped, when in a Moon-shine night he observed the course of the stars, and motion of the Moon. The reason of this *Greek* name *Ascalabotes*, is taken from *Ascalos*, a circle, because it appeareth on the back full of such circles like stars, as writeth *Perottus*. Howbeit, that seemeth to be a faigned Etymologie, and therefore I rather take it, that *Ascala* signifieth impurity, and that by reason of the uncleanness of this beast, it was called *Ascalabates*, or as *Suidas* deriveth it, of *Colebates*, because by the help and dexterity of the fingers, it climbeth up the walls even as Rats and Mice; or as *Kiramides* will have it, from *Calos*, signifying a piece of wood, because it climbeth upon wood and trees. And for the same reason it is called *Galeotes*, because it climbeth like a Weasel, but at this day it is vulgarly called among the *Grecians*, *Liakoni*; although some are also of opinion, that it is also known among them by the words *Thamiamithos*, and *Psammamythe*.

Among the vulgar *Hebrews*, it is sometimes called *Letaab*, and sometimes *Semmamit*, as *Munster* writeth. The *Arabians* call it *Sarnabras*, and *Senabras*, a *Stellion* of the Gardens. And peradventure *Guarill*, *Guasemabras*, *Alurel*, and *Gnases*. And *Sylvaticus* also useth *Epithets* for a *Stellion*. And the general *Arabian* word for such creeping biting things, is *Vasga*, which is also rendered a Dragon of the house. Instead of *Colotes*, *Albertus* hath *Arcolus*. The *Germans*, *English*, and *French*, have no words for this Serpent, except the *Latine* word, and therefore I was justly constrained to call it a *Stellion*, in imitation of the *Latine* word.

As I have shewed some difference about the name, so it now ensueth that I should do the like about the nature and place of their abode. First of all therefore I must put a difference betwixt the *Italian* *Stellion* or *Tarentula*, and the *Thracian* or *Grecian*, for the *stellion* of the Ancients is proper to *Grecia*. For they say this *Stellion* is full of *Lentile* spots, or speckles, making a sharp or shrill shrieking noise, and is good to be eaten, but the other in *Italy* are not so. Also they say in *Sicilia*, that their *Stellions* inflict a deadly biting, but those in *Italy* cause no great harm by their teeth. They are covered with a skin like a shell or thick bark, and about their backs there are many little shining spots like eyes, (from whence they have their names) streaming like stars, or drops of bright and clear water, according to this verse of *Ovid*;

— Aptumque colori
Nomen habet variis Stellatus corpora guttis.

Which may be Englished thus;

And like his Spotted hiew, so is his name,
The body starred over like drops of rain.

It moveth but slowly, the back and tail being much broader then is the back and tail of a Lizard, but the *Italian* *Tarentulae* are white, and in quantity like the smallest Lizards: and the other *Grecian* Lizards, (called at this day among them *Haconi*) is of bright silver colour, and are very harmful and angry, whereas the other are not so, but so meek and gentle, as a man may put his fingers into the mouth of it without danger. One reason of their white bright shining colour, is because they want blood, and therefore it was an error in *Sylvaticus* to say that they had blood.

The teeth of this Serpent are very small and crooked, and whensoever they bite, they stick fast in the wound, and are not pulled forth again except with violence. The tail is not very long, and yet when by any chance it is broken, bitten, or cut off, then it groweth again. They live in houses, and neer unto the dores and windows thereof make their lodgings, and sometimes in dead-mens graves and Sepulchres, but most commonly they climbe and creep aloft, so as they fall down again; sometimes into the meat as it is in dressing; and sometimes into other things, (as we have already said) into *Socrates* mouth, and when they descend of their own accord, they creep side-long. They eat Honey, and for that cause creep into the Hives of Bees, except they be very carefully stopped, as *Virgil* writeth;

Nam saepe favos, ignotus adedit Stellio.

Many times the Stellion at unawares meeteth with the Honey-combs. They also of Italy many times eat Spiders. They all lie hid four months of the year, in which time they eat nothing, and twice in the year, that is to say, both in the Spring time and Autumn, they cast their skin, which they greedily eat so soon as they have stripped it off. Which Theophrastus and other Authors write, is an envious part in this Serpent or creeping creature, because they understand that it is a noble remedy against the Falling-sickness: wherefore to keep men from the benefit and good which might come thereby, they speedily devour it.

And from this envious and subtle part of the Stellion, cometh the crime in Ulpianus called *Crimen Stellionatus*, that is, when one man fraudulently preventeth another of his money, or wares, or bargain, even as the Stellion doth man kinde of the remedy which cometh unto them by and from his skin.

The crime is also called Extortion, and among the Romans, when the Tribunes did withdraw from the Souldiers their provision of victual and corn, it is said, *Tribunos qui per Stellaturas Militibus aliquid abstulissent, capitali pœna affecit*. And therefore Budæus relateth a History of two Tribunes, who for this stellature were worthily stoned to death by the commandment of the Emperor. And all frauds whatsoever, are likewise taxed by this name, which were not punishable but by the doom of the Supreme or highest Judge, and thereupon *Alciatus* made this Emblem following.

*Parva lacerta, atris Stellatus corpore guttis
Stellio, qui latebras & cava busta colit,
Invidiæ praviq; doli fert symbola, pitiùs:
Heu nimium nurbus cognita Zelotypis.*

*Nam turpi obtegitur faciem lentigine, quisquis
Sit quibus immerfus Stellio, vinâ bibat.
Hinc vindicta frequens, decepta pellice vino,
Quam formæ amisso flore relinquit amans.*

Which may be Englished thus;

The little Lizard, or Stellion starred in body grain
In secret holes, and graves of dead which doth remain,
When painted you it see, or drawn before the eye,
A symbole then you view of deep deceit and cursed envy:
Alas, this is a thing to jealous wives known too well,
For whosoever of that Wine doth drink his fill
Wherein a Stellion hath been drencht to death,
His face with filthy Lentile spots all ugly it appeareth,
Herewith a Lover oft requites the fraud of concubine,
Depriving her of beauties biew by draught of this same Wine.

The Poet Ovid hath a pretty fiction of the Original of this cursed envy in Stellions, for he writeth of one *Abas* the son of *Metaneira*, that received *Ceres* kindly into her house, and gave her hospitality, whereat the said *Abas* being displeased, derided the sacrifice which his mother made to *Ceres*; the Goddesse seeing the wretched nature of the young man, and his extream impiety against the sacrifice of his Mother, took the Wine left in the goblet after the sacrifice, and poured the same upon his head, whereupon he was immediately turned into a Stellion, as it is thus related by Ovid. *Metam. 5.*

*Combibit os maculas, & quæ modo brachia gessit
Crura gerit, cauda est mutatis addita membris;
Inque brevem formam, ne sit vis magna nocendi,
Contrahitur, parvaque minor mensura lacerta est.*

In English thus;

His mouth suckt in those spots: and now where arms did stand,
His legs appear, and to his changed parts was put a tail,
And lest it should have power to harm, small was the bodies band,
And of the Lizards poysonous, this least in shape did vail.

Their bodies are very brittle, so as if at any time they chance to fall, they break their tails. They lay very small egges, out of which they are generated: and *Pliny* writeth, that the juyce or liquor of these egges laid upon a mans body, causeth the hair to fall off, and also never more permiteth it to grow again. But whereas we have said, it devoureth the skin, to the damage and hurt of men, you must remember, that in ancient time the people did not want their policies and devises to take away this skin from them before they could eat it. And therefore in the Summer time they watched the lodging place and hole of the Lizard, and then in the end of the Winter toward the Spring, they took Reeds and did cleave them in sunder, these they composed into little Cabinets, and set them upon the hole of the Serpent: Now when it awaked and would come forth, it being grieved with the thicknesse and straightnesse of his skin, presseth out of his hole through those Reeds or Cabinet, and finding the same somewhat straight, is the more glad to take it for a remedy; so by little and little it slideth through, and being through, it leaveth the skin behinde in the Cabinet, into the which it cannot re-enter to devour it. Thus is this wily Serpent by the policy of man justly beguiled, losing that which it so greatly desireth to possesse, and changing nature, to line his guts with his coat, is prevented from that gluttony, it being sufficient to have had it for a cover

in the Winter, and therefore unsufferable that it should make food thereof, and eat the same in the Summer,

These Stellions (like as other Serpents) have also their enemies in nature, as first of all they are hated by the Asses, for they love to be about the Mangers and racks on which the Asses feedeth, and from thence many times they creep into the Asses open Nostrils, and by that means hinder his eating. But above all other, there is greatest antipathy in nature betwixt this Serpent and the Scorpion, for if a Scorpion do but see one of these, it falleth into a deep fear, and a cold sweat, out of which it is delivered again very speedily: and for this cause a Stellion putrified in Oyl, is a notable remedy against the biting of a Scorpion; and the like war and dissension, is affirmed to be betwixt the Stellion and the Spider.

Aetius.

We have shewed already, the difference of Stellions of *Italy* from them of *Greece*, how these are of a deadly poysonous nature, and the other innocent and harmlesse, and therefore now it is also convenient, that we should shew the nature and cure of this poyson, which is in this manner;

Whensoever any man is bitten by a Stellion, he hath ach and pain thereof continually, and the wound received looketh very pale in colour, the cure whereof, according to the saying of *Aetius*, is to make a plaister of Garlick and Leeks mixed together, or else to eat the said Garlick and Leeks, drinking after them a good draught of sweet Wine, unmixed and very pure, or else apply *Nigella Romana*, *Sesamyn*, and sweet Water unto it. Some (as *Arnoldus* writeth) prescribe for this cure the dung of a Faulcon, or a Scorpion to be bruised all to pieces, and laid to the wound. But sometimes it happeneth, that a mans meat or drink is corrupted with Stellions that fall into the same from some high place where they desire to be climbing, and then if the same Meat or Wine so corrupted be eaten or drunk, it causeth unto the party a continual vomiting and pain in the stomach. Then must the cure be made also by vomits to avoid the poyson, and by Glysters to open the lower passage, that so there may be no stop or stay, to keep the imprisoned meat or drink in the body. And principally those things are prescribed in this case, which are before expressed in the *Cantharides*, when a man hath by any accident been poysoned by eating of them.

Crescen.

Pliny.

The remedies which are observed out of this Serpent are these: Being eaten by Hawks, they make them quickly to cast their old coats or feathers. Others give it in meat after it is bowelled, to them that have the Falling-sicknesse. Also when the head, feet, and bowels are taken away, it is profitable for those persons which cannot hold in their urine; and being sodden, is given against the Bloody-flux. Also sod in Wine with black Poppy-seed, cureth the pain of the loins, if the Wine be drunk up by the sick patient.

The Oyl of Stellions being anointed upon the arm-holes or pits of children, or young persons, it restraineth all hair for ever growing in those places. Also the Oyl of Stellions, which are sod in Oyl-olive with Lizards, do cure all boils and wens, consuming them without lancing or breaking. And the ashes of the Stellion are most principally commended against the Falling-sicknesse, like as also is the skin or trunk, as we have said before. The head burned and dried, and afterward mixed with Honey-attick, is very good against the continual dropping or running of the eyes; and in the days of *Pliny*, he writeth that they mixed *Stibium* herewithal. The heart is of so great force, that it being eaten, bringeth a most deep and dangerous sleep, as may appear by these verses:

*Mande cor, & tantus prosterne corpora somnus,
Ut scindi possunt absque dolore manus.*

Which may be Englished thus;

*Eat you the heart, and then such sleep the body will possesse,
That hands may from the same be cut away painlesse.*

To conclude, the Physitians have carefully observed sundry medicines out of the egges, gall, and dung of Stellions, but because I write for the benefit of the *English* Reader, I will spare their relation, seeing we shall not need to fear the bitings of Stellions in *England*, or expect any drugs among our Apothecaries out of them, and therefore I will here end the History of the Stellion.

Of the TYRE.

Aetorius.

Celius Rho.

Amatus.

Here be some which have confounded this Serpent with the Viper, and taken them both to be but one kinde, or at least the Tyre to be a kinde of Viper, because the *Arabians* call a Viper *Thiron*, of the *Greek* word *Therion*, which signifieth a wilde beast, and whatsoever the *Grecians* write of their *Echidna*, that is their Viper, the same things the *Arabians* write of the Tyre, and *Leonice-nus* compiled a whole Book in the defence of that matter: and from hence cometh that noble name or composition antidotary, called *Theriaca*, that is, Triacle. But *Avicen* in the mention of the Triacle of *Andromachus*, distinguisheth the Triacle of the Viper, from that of the Tyre, and calleth one of them *Trobiscos Tyri*, and the other *Trobiscos Viperae*. So *Gentilis* and *Florentinus* do likewise put a manifest difference betwixt the Tyre and the Viper, although in many they are alike, and agree together.

This Tyre is called in *Latine* *Tyrus* and *Tyria*, and also among the *Arabians*, as *Sylvaticus* writeth, *Eosmari*, and *Alphahex*. *Rabbi Moses* in his Aphorisms writeth, that when the Hunters go to seek these

These Serpents, they carry with them bread, which they cast unto them; and while the Tyre doth eat it, he closeth his mouth so fast, that his teeth cannot suddenly open again to do his hunting adversary any harm, and this thing (as he writeth) is very admirable at the first, to them that are ignorant of the secret in nature. Galen also writeth so much to Pise of Vipers, and he saith that the Circulators, Juglers or Quacksalvers, did cast certain mazes or small cakes to them; which when they had tasted, they had no power to harm any body.

This *Tyrus* is said to be a Serpent about the coasts of *Jericho* in the Wildernesse; where it hunteth Birds, and liveth by devouring of them and their eggs. And a confection of the flesh of this Serpent, with the admixture of some few other things, taketh away all intoxicate poyson, which confection is called *Triacle*. It is also reported, that whereas the Dragons have no poyson of themselves, they take it away from this Serpent, and so poyson with a borrowed venom. For this poyson is very deadly: and there is a tale (which I will not tell for truth) that before the coming and death of our Saviour Jesus Christ, the same was unremediable, and they dyed thereof, whosoever they were that had been poysoned by a Tyre; but on the day of Christ his passion, one of them was found by chance in *Jerusalem*, which was taken alive, and brought to the side of our Saviour hanging upon the Crosse, where it also fastened the teeth, and from that time ever since, all the kinde have received a qualified and remediable poyson, and also their flesh made apt to cure it self, or other venoms.

It is reported that when the *Tyrus* is old, he casteth, or rather wresteth off his coat in this manner following; First it getteth off the skin which groweth betwixt the eyes, by which it looketh as if it were blinde; and if it be strange to a man, (I mean the first time that ever he saw it) he will verily take it to be blinde: afterward, it also sleiyeth off the skin from the head, and so at last by little and little, the whole body, at which sight it appeareth as though it were an Embryon, or skinlesse Serpent. They keep their eggs in their belly, and in them breed their young ones, as the Vipers do, for before they come out of the dams belly, they are in all parts (according to their kinde) perfect creatures; and so every one generateth his like, as do four-footed Beasts.

I take it by the relation of *Gesner*, that the *Dipsas* in *Italy* is called *Tyrus*. Also *Cardan* writeth, that there is a supposed and false conceit, that with the flesh of this Tyre, mixed with Hellebore and water, is made a confection to restore youth: but the truth is, it rather weakeneth and destroyeth bodies, then helpeth them, and maketh a counterfeit or varnished false youth, but no true youth at all. Thus far *Cardan*, and thus much of this Serpent, the other things written of it, are the same that are written of the Viper.

Of the TORTOISE.

THE last four-footed Egge-breeding Beast, cometh now to be handled in due order and place; namely, the Tortoise, which I have thought good to insert also in this place, although I cannot finde by reading or experience, that it is venomous, yet seeing other before me have ranged the same in the number and catalogue of these Serpents and creeping creatures, I will also follow them; and therefore I will first expresse that of the Tortoise, which is general and common to both kindes, and then that which is special, and proper to the Land and Sea Tortoises.

The name of this Beast is not certain, among the *Hebrews* some call it *Schabbul*, some *Kipod*, and some *Homet*; whereas every one of these do also signifie another thing, as *Schabbul*, a Snail; *Kipod*, a Hedge-hog; and *Homet*, a Lizard. The *Chaldeans* call this Beast *Thiblela*; the *Arabians* term it *Sisemat*, also *Kauoen salabbase*, and *Halacbalie*; the *Italians* call this *Testuma*, *testudine*, *vel testugine*, *tartuca*, *ensuruma*, *tartocha*, & *coforona*. And in *Ferraria*, *Gallana*, *tartugella*, *bisca scutellaria*; the *Inhabitants* of *Taurinum*, *Cupparia*; the *Portugals*, *Gagado*; the *Spaniards*, *Galapago*, and *Tartuga*; the *French*, *Tortue*, and *Tartue*; and in *Savoy*, *Bong coupe*; the *Germans*, *Schiltkrot*, and *Tallerkrot*; the *Flemings*, *Schilt-padde*, which answereth our English word *Shell-crab*; the *Grecians* call it *Chelone*; and the *Latines*, *Testudo*: which words in their several languages, have other significations, as are to be found in every vocabular Dictionary, and therefore I omit them, as not pertinent to this businesse or History.

There be of Tortoises three kindes, one that liveth on the land, the second in the sweet waters, and the third in the Sea, or salt waters. There are found great store of these in *India*, especially of the Water-tortoises, and therefore the people of that part of the Countrey are called *Chelonophagi*; that is, Eaters of Tortoises, for they live upon them: and these people are said to be in the East-part of *India*. And in *Carmania* the people are likewise so called. And they do not only eat the flesh of them, but also cover their houses with their shells, and of their abundance, do make them all manner of vessels. *Pliny* and *Solinus* write, that the Sea-tortoises of *India* are so big, that with one of them they cover a dwelling Cottage. And *Strabo* saith, they also row in them on the waters, as in a Boat.

The Island of *Serapis* in the Red-sea, and the farthest Ocean Islands, toward, the East of the Red-sea, hath also very great Tortoises in it; and every where in the Red-sea they so abound, that the people there do take them and carry them to their greatest Marts and Fairs to sell them, as to *Raphis*, to *Ptolemais*, and the Island of *Dioscorides*, whereof some have white and small shells. In *Lybia* also they are found, and in the night time they come out of their lodgings to feed, but very softly, so as one can scarcely perceive their motion.

And of one of these *Scaliger* telleth this story. One night (saith he) as I was travelling, being overtaken with darknesse and want of light, I cast about mine eyes to seek some place for my lodging, safe and secure from wilde Beasts; and as I looked about, I saw (as I thought) a little hill or heap of earth, but in truth it was a Tortoise, covered all over with mosse: upon that I ascended and sate down to rest, whereupon after a little watching I fell asleep, and so ended that nights rest upon the back of the Tortoise. In the morning, when light approached, I perceived that I was removed far from the place, whereon I first chose to lodge all night; and therefore rising up, I beheld with great admiration the face and countenance of this Beast, in the knowledge whereof, (as in a new nature) I went forward, much comforted in my wearisome journey.

The description of the Tortoise and several parts thereof now followeth to be handled. Those creatures (saith *Pliny*) which bring forth or lay eggs, either have feathers as Fowls, or have scales as Serpents, or thick hides as the Scorpion, or else a shell like the Tortoise. It is not without great cause that this shell is called *Scutum*, and the Beast *Scutellaria*, for there is no buckler and shield so hard and strong as this is. And *Palladius* was not deceived when he wrote thereof, that upon the same might safely passe over a Cart-wheel, the Cart being loaded. And therefore in this the Tortoise is more happy then the Crocodile, or any other such Beast.

Albertus writeth that it hath two shels, one upon the back, the other on the belly, which are conjoyned together in four places, and by reason of this so firm a cover and shell, the flesh thereof is dry and firm, also long lasting, and not very easie or apt to putrefaction. This shell or cover is smooth, except sometimes when it is grown old, it hath mosse upon it, and it never casteth his coat in old age, as other creeping things do. In the head and tail it resembleth a Serpent, and the great Tortoises have also shels upon their heads like a shield, yet is the head but short, and the aspect of it very fearful, until a man be well acquainted therewith. And by reason of the hardnesse of their eyes, they move none but the neather eye-lid, and that without often winking. The liver of it is great, yet without any bloud. It hath but one belly without division, and the liver is always foul, by reason of the vitious temperature of the body. The milt is exceeding small, coming far short of the bodies proportion.

Beside, the common nature of other thick-hided creatures. It hath also reins, except that kinde of Tortoise called *Lutaria*, for that wanteth both reins and bladder; for by reason of the softnesse of the cover thereof the humor is over-fluent; but the Tortoise that bringeth forth eggs hath all inward parts like a perfect creature: and the females have a singular passage for their excrements, which is not in the males. The eggs are in the body of the belly, which are of a party-colour like the eggs of Birds.

Their stones cleave to their loins, and the tail is short, but like the tail of a Serpent.

They have four legs, in proportion like the legs of Lizards, every foot having five fingers or divisions upon them, with nails upon every one. And thus much for the several parts.

They

They are not unjustly called *Amphibia*, because they live both in the water and on the land, and in this thing they are by *Pliny* resembled to Beavers: but this must be understood of the general, otherwise the Tortoises of the land do never dare come into the water: and those of the water can breath in the water, but want respiration, and likewise they lay their Egges and sleep upon the dry land. They have a very slow and easie pace; and thereupon *Pavus* calleth it *Tardigrada*, and also there is a Proverb, *Testudineus incessus* for a slow and soft pace, when such a motion is to be expressed. The Tortoise never casteth his coat, no not in his old age. The voyce is an abrupt and broken hissing, not like to the Serpents, but much more loud and diffused. The male is very salacious and given to carnal copulation, but the female is not so; for when she is attempted by the male, they fight it out by the teeth, and at last the male overcometh, whereat he rejoyceth as much as one that in a hard conflict, fight, or battail, hath won a fair Woman; the reason of this unwillingnesse is, because it is exceeding painful to the female. They engender by riding or covering one another. When they have laid their Egges, they do not sit upon them to hatch them, but lay them in the Earth, covered, and there by the heat of the Sun is the young one formed, and cometh forth at due time without any further help from his Parents.

They are accounted crafty and subtle in their kinde, for subtilnesse is not only ascribed to things that have a thin bloud, but also to those that have thick skins, hides, and covers, such as the Tortoise and Crocodile have. The Tortoise is an enemy to the Partridge, as *Philes* and *Ælianus* write: Also the Ape is as fraid thereof, as it is of the Snail: and to conclude, whatsoever enemy it hath, it is safe enough as long as it is covered with his shell, and clingeth fast to the earth beneath; and therefore came the proverb, *Oikos philos, oikos aristos*. That house which is ones friend, is the best house.

The Poets give a fabulous reason, why the Tortoise doth ever carry his house upon his back, which is this: They say, that on a time *Jupiter* had all living creatures to a banquet or Marriage feast, and thither they all came at the time appointed, except the Tortoise: and she at last also appeared at the end of the feast when the meat was all spent: whereat *Jupiter* wondered, and asked her why she came no sooner? Then it answered him, *Oikos philos, oikos aristos*; at which answer *Jupiter* being angry, adjudged her perpetually to carry her house on her back, and for this cause they fable, that the Tortoise is never separated from her house.

Flaminius the Roman dissuading the *Acheans* from attempting the Island of *Zacynthus*, used this argument; and so afterward *T. Livius*. *Ceterum sicut Testudinem, ubi collecta in suum tegumen est, tutam ad omnes ictus vidi esse: ubi exierit partes aliquas, quodcumque nudavit, obnoxium atque infirmum habere: Haud dissimiliter vobis Achæi, clausis undique maris, quod intra Peloponnesum est, termino, ea & jungere vobis, & juncta tueri facile: si semel aviditate plura amplectendi hinc excedatis, nuda vobis omnia quæ extra sunt & exposita ad omnes ictus esse.* Thus saith *Pliny*. That is to say, Even as when the Tortoise is gathered within the compasse of her shell, then is it safe and free from all strokes, and feeleth no violence, but whensoever she putteth forth a limb or part, then is it naked, infirm, and easie to be harmed: so is it with you *Acheans*, for by reason of the inclosed seat of *Peloponnesus* within the Straights of the Sea, you may well winde all that together, and being conjoyned, as well defend it: But if once your avidous and covetous mindes to get more, appear and stretch it self beyond those limits, you shall lay open your naked infirmity and weaknesse, to all force, blows, and violence whatsoever. Wherefore the Tortoise careth not for flies, and men with good armour care not much for light and easie adversaries.

Alciatus hath a witty Emblem of a Tortoise to expresse a good hufwife, and that the fame of her vertues, spreadeth much further then either beauty or riches.

*Alma Venus, quænam hæc facies? quid denotat illa
Testudo, molli quam pede diva premis?*

Me sic effinxit Phidias, sexumque referri

Which may be Englished thus;

Loves holy God, what means that ugly face?

What doth that Tortoise signifie indeed,

Which thou O God I desse under soft foot dost pace?

Declare what means the same to me with speed:

Fæmineum nostra jussit ab effigie,

Quodq; manere domi, & tacitas debet esse puellas,

Supposuit pedibus talia signa meis.

Such is the shape that Phidias did me frame,

And bade me go resemble Womankind,

Te teach them silence, and in house remain,

Such pictures underneath my feet you finde.

There is a manifold use of Tortoises, especially of their cover or shell, and likewise of their flesh, which cometh now to be handled. And first of all, the ancient ornaments of Beds, Chambers, Tables, and Banqueting houses, was a kinde of artificial work, called *Carvilius*, and this was framed in gold and silver, brasse and wood, Ivory and Tortoise-shells; but, *Modo luxuria non fuerit contenta ligno, jam lignum emi testudinem facit*: That is to say, Ryot not contented, sought precious frames of wood; and again, the use of wood caused Tortoise-shells to be deerly bought, and thereof also complained the Poet *Juvenal*, where he saith;

*Nemo curabat
Rivalis in Oceani fluctu testudo nataret
Clarum Trojugenis factura & nobile fulcrum.*

Yyy 2

In

In English thus;

Then none did care for Tortoise in the Ocean flood,
To make the noble beds for Trojans blood.

We have shewed already that there are certain people of the East called *Chelophagi*, which live by eating of Tortoises, and with their shells they cover their houses, make all their vessels, row in them upon the water, as men use to row in boats, and make them likewise serve for many other uses.

But as concerning the eating of the flesh of Tortoises, the first that ever we read that used this ill diet, were the *Amazons*, according as *Cælius Rhod*: and other Authors writeth. Besides, *Aloysius Cadamustus* affirmeth, that he himself did tast of the flesh of a Tortoise, and that it was white in colour, much like unto Veal, and not unpleasant. But *Rasis* is of a clean contrary opinion, condemning it for very unsavory, and unwholesome, because the taste and temperament thereof is betwixt the Land and the Water, it being a Beast that liveth in both Elements. And in eating hereof the *Grecians* have a proverb, *Chelones kreas he phagein, he me phagein*: That is, either eat Tortoise flesh, or eat it not. Meaning that when we eat it, we must eat nothing else, and therefore must be filled sufficiently only with that kinde of meat; For to eat little, breedeth fretting in the belly, and to eat much is as good as a purgation, according to the observation of many actions, which being done *frigide & ignaviter*, that is, coldly and slothfully to halves, do no good, but being done *acriter & explicate*, earnestly and thoroughly bring much content and happinesse.

But I marvel why they are used in this age, or desired by Meat-mongers, seeing *Apicius* in all his Book of Variety of Meats, doth not mention them; and I therefore will conclude the eating of Tortoises to be dangerous, and hateful to Nature it self, for unlesse it be taken like a Medicine, it doth little good, and then also the Sawces and decoctions or compositions that are confected with it, are such as do not only qualifie, but utterly alter all the nature of them, (as *Stephanus Aquæus* hath well declared in his French discourse of Frogs and Tortoises.) And therefore to conclude this History of the Tortoise, I will but recite one riddle of the strangenesse of this Beast which *Tertullian* out of *Pavinius* maketh mention of, and also in Greek by *Mascopulus*, which is thus translated.

Animal peregrinæ naturæ, sine spiritu spiro, geminis oculis retro juxta cerebrum, quibus ducibus antrorsum progredior. Super ventre caruleo pergo, sub quo venter latet albus, apertus & clausus. Oculi non aperiuntur, neq; progredior, donec venter intus albus vacuus est. Hoc saturato, oculi apparent insignes, & pergo ad iter: Et quanquam mutum varias edo voces: That is to say, I am a living creature, of a strange nature, I breath without breath, with two eye behinde, neer my brains do I go forward, I go upon a blew belly, under which is also another white, open and shut, my eyes never open, I go forward until my belly be empty, when it is full, then they appear plain and I go on my journey, and although I am mute or dumb, yet do I make many voyces. The explication of this riddle, will shew the whole nature of the Beast, and of the Harp called *Chelys*. For some things are related herein of the living creature, and some things again of an Instrument of Musick made upon his shell and cover. And thus much for the Tortoise in general, the Medicines I will reserve unto the end of this History.

Of the TORTOISE of the Earth, whose shell is only figured.

These Tortoises which never come in water, either sweet or Salt, clear or muddy, are called by *Grecians*, *Chelone Chersate*; by the *Latines*, *Chersina*, and *Testudines*, *Terrestres*, *Sylvestres*, and *Montane*; and by *Nicander*, *Orine*; and the French peculiarly *Tortue des Bois*, a Tortoise of the wood.

Sirabo.

These are found in the Desarts of *Africa*, as in *Lybia* and *Mauritania*, in the open fields, and likewise in *Lydia* in the Corn-fields, for when the Plough-men come to plough their land, their shares turn them out of the earth upon the furrows as big as great Glebes of land. And the shells of these the Husbandmen burn on the land, and dig them out with Spades and Mattocks, even as they do Worms among places full of such vermine.

The *Hill-Parthenius*, and *Soror* in *Arcadia*, do yeeld many of these land Tortoises. The shell of this living Creature is very pleasantly distinguished with divers colours, as earthy, black, blewish, and almost like a Salamanders. The liver of it is small, yet apt to be blown or swell with winde, and in all other parts they differ not from the common and vulgar general prefixed description.

Plinius.

These live in Corn-fields, upon such fruits as they can finde; and therefore also they may be kept in Chests or Gardens, and fed with Apples, Meal, or Bread without Leaven. They eat also Cockles, and Worms of the earth, and Three-leaved-grasse. They will also eat Vipers, but presently after

after they eat Origan, for that herb is an antidote against Viperine poyson for them, and unlesse they can instantly finde it, they die of the poyson. The like use it is said to have of Rue, but the Tortoises of the sandy Sea in *Africk* live upon the fat, dew, and moistnesse of those Sands. They are ingendered like other of their kinde, and the males are more venereous then the females, because the female must needs be turned upon her back, and she cannot rise again without help: wherefore many times the male after his lust is satisfied, goeth away, and leaveth the poor female to be destroyed of Kites, or other adversaries: their natural wisdom therefore hath taught them to prefer life and safety before lust and pleasure. Yet *Theocritus* writeth of a certain herb, that the male Tortoise getteth into his mouth, and at the time of lust turneth the same to his female, who presently upon the smell thereof, is more enraged for copulation then is the male, and so giveth up her self to his pleasure without all fear of evil, or providence against future danger: but this herb neither he nor any other can name. They lay Egges in the earth, and do not hatch them, except they breath on them with their mouth, out of which at due time come their young ones. All the Winter time they dig themselves into the earth, and there live without eating any thing, insomuch as a man would think they could never live again, but in the Summer and warm weather they dig themselves out again without danger.

The Tortoises of *India* in their old and full age change their shells and covers, but all other in the World never change or cast them. This Tortoise of the earth is an enemy to Vipers, and other Serpents, and the Eagles again are enemies to this, not so much for hatred as desirous thereof for Physick, against their sicknesses and diseases of nature; and therefore they are called in *Greek* *Chelonophagoi astoi*, Tortoise-eating Eagles: for although they cannot come by them out of their deep and hard shells, yet they take them up into the air, and so let them fall down upon some hard stone or Rock, and thereupon it is broken all to peeces, and by this means dyed the famous Poet *Aeschylus*, which kinde of fate was foretold him, that such a day he should die: wherefore to avoid his end, in a fair Sun-shine clear day he sate in the fields, and suddenly an Eagle let a Tortoise fall down upon his head which brake his skull, and crushed out his brains; whereupon the *Grecians* wrote:

Aeschulo graphontē, epiptōke Chelone.

Which may be Englished thus;

Aeschylus writing upon a rock,

A Tortoise falling, his brains out knock.

The use of this land Tortoise, are first for Gardens, because they clear the Gardens from Snails and Worms: out of the *Arcadian* Tortoises they make Harps, for their shells are very great, and this kinde of Harp is called in *Latine* *Testudo*, the inventor whereof is said to be *Mercury*, for finding a Tortoise after the falling in of the River *Nilus*, whose flesh was dried up, because it was left upon the Rocks, he struck the sinews thereof, which by the force of his hand made a musical sound, and thereupon he framed it into a Harp, which caused other to imitate his action, and continue that unto this day.

These Tortoises are better meat then the Sea or Water Tortoises: and therefore they are preferred for the belly; especially they are given to Horses, for by them they are raised in flesh, and made much fatter. And thus much shall suffice for the Tortoise of the earth.

Of the TORTOISE of the Sweet-water.

Pliny maketh four kindes of Tortoises, one of the Earth, a second of the Sea, a third called *Lutaria*, and the fourth called *Smysa*, living in Sweet-waters, and this is called by the *Portugals*, *Cagado*; and *Gagado*; the *Spaniards*, *Galapag*; and the *Italians*, *Gaiandre de aqua*. There are of this kinde found in *Helvetia*, neer to *Zurick*, at a Town called *Andelsinge*: but the greatest are found in the River *Ganges* in *India*, where their shells are as great as tuns, and *Damasceen* writeth, that he saw certain Embassadors of *India*, present unto *Augustus Caesar* at *Antiochia*, a Sweet-water Tortoise, which was three cubits broad. They breed their young ones in *Nilus*. They have but a small Milt; and it wanteth both a bladder and reins. They breed their young ones and lay their Egges on the dry land, for in the water they die without respiration: therefore they dig a hole in the earth wherein they lay their Egges, as it were in a great ditch, of the quantity of a Barrel, and having covered them with earth, depart away from them for thirty days; afterwards they come again and uncover their Eggs, which they finde formed into young ones, those they take away with them into the water: and these Tortoises at the inundation of *Nilus* follow the Crocodiles, and remove their nests and egges from the violence of the floods.

There was a magical and superstitious use of these Sweet-water Tortoises against Hail, for if a man take one of these in his right hand, and carry it with the belly upward round about his Vineyard, and so returning in the same manner with it, and afterward lay it upon the back, so as it cannot turn on the belly, but remain with the face upward, all manner of Clouds should passe over that place and never empty themselves upon that Vineyard. But such Diabolical and foolish observations were not so much as to be remembered in this place, were it not for their sillinesse; that by knowing

them; men might learn the weaknesse of humane wisdom when it erreth, from the Fountain of all science and true knowledge (which is Divinity) and the most approved operations of Nature: And so I will say no more in this place of the Sweet-water Tortoise.

Of the TORTOISE of the Sea.

IT were unproper and exorbitant to handle the Sea-tortoise in this place, were it not because it liveth in both elements, that is, both the water and the land, wherefore seeing the Earth is the place of his generation, as the Sea is of his food and nourishment, it shall not be amisse nor improper (I trust) to handle this also among the Serpents and creeping things of the earth.

Pliny calleth this Sea-tortoise *Mus Marinus*, a Mouse of the Sea, and after him *Albertus* doth so likewise. The *Arabians* call it *Asfulbasch*; and the *Portugals*, *Tartaruga*; and in *Germany*, *Meeischiltkrott*, which the common Fisher-men call the Souldier, because his back seemeth to be armed and covered with a shield and helmet, especially on the fore-part: which shield is very thick, strong, and triangular, there being great veins and sinews which go out of his neck, shoulders, and hips, that tie on and fasten the same to his body.

His fore-feet being like hands, are forked and twisted very strong, and with which it fighteth and taketh his prey, and nothing can presse it to death except the frequent strokes of Hammers. And in all their members except their quantity, and their feet, they are much like the Tortoises of the earth, for otherwise they are greater, and are also black in colour. They pull in their heads as occasion is ministred to them, either to fight, feed, or be defended, and their whole shell or cover seemeth to be compounded of fine Plates. They have no teeth, but in the brims of their beaks or or snouts are certain eminent divided things like teeth, very sharp, and shut upon the under lip like as the cover of a Box, and in the confidence of the sharp prickles, and the strength of their hands and backs, they are not afraid to fight with men.

Their eyes are most clear and splendent, casting their beams far and near, and also they are of white colour, so that for their brightnesse and rare whitenesse, the Apples are taken out and included in Rings, Chains, and Bracelets. They have reins which cleave to their backs, as the Reins of a Bugle or Ox. Their feet are not apt to be used in going, for they are like to the feet of Seals or Sea-calves, serving in stead of Oars to swim withall. Their legs are very long, and stronger in their feet and nails, then are the claws of the Lion.

Brasavolus.

They live in Rocks and the Sea-sands, and yet they cannot live altogether in the water, or on the land, because they want breathing and sleep, both which they perform out of the Water: yet *Pliny* writeth, that many times they sleep on the top of the water, and his reason is, because they lie still unmoveable, (except with the Water) and snort like any other Creature that sleepeth, but the contrary appeareth, seeing they are found to sleep on the land, and the snorting noise they make is but an endeavour to breath, which they cannot well do on the top of the water, and yet better there then in the bottom.

Aristotle.

They feed in the night-time, and the mouth is the strongest of all other Creatures, for with it they crush in pieces any thing, be it never so hard, as a stone or such things: they also come and eat grasse on the dry land. They eat certain little Fishes in the Winter time, at which season their mouth is hardest, and with these Fishes they are also baited by men, and so taken. *Pausanias* writeth, that in *Africa* that there are Maritime Rocks called *Scelestæ*, and there dwelleth among a creature called *Scynon*, that is *Zytyron*, a Tortoise, and whatsoever he findeth on those Rocks which is stranger in the Sea, the same he taketh and casteth down headlong. They engender on the Land, and the female resisteth the copulation with the male, until he set against her a stalk or stem of some tree or plant. They lay their Eggs and cover them in the earth, planing it over with their breasts, and in the night-time they sit upon them to hatch them. Their Eggs are great, of divers colours, having a hard shell, so that the young one is not framed or brought forth within lesse compasse then a year, (as *Aristotle* writeth) but *Pliny* saith thirty days.

Oppianus.
Plinius.

And for as much as they cannot by Nature, nor dare for accident long tarry upon the land: they set certain marks with their feet upon the place where they lay their Eggs, whereby they know the place again, and are never deceived. Some again say, that after they have hid their Eggs in the earth forty days, the female cometh the just fortieth day, not failing of her reckoning, and uncovereth her Eggs wherein she findeth her young ones formed, which she taketh out as joyfully as any man would do Gold out of the earth, and carryeth them away with her to the water. They lay sometimes an hundred Eggs, and sometimes they lay fewer, but ever the number is very great.

Plutarch.

There is upon the left side of *Hispaniola*, a little Island upon the Port *Beata*, which is called *Alus Bellus*, where *Peter Martyr* reporteth strange things of many creatures; especially of the Tortoises, for he writeth, that when they rage in lust for copulation, they come on shore, and there they dig a ditch wherein they lay together three or four hundred Eggs, being as great as Goose Eggs, and when they have made an end, they cover them with sand and go away to the Sea, not once looking after them: but at the appointed time of Nature, by the heat of the Sun, the young Tortoises are hatched, engendered, and produced into light without any further help of their parents.

Great is the courage of one of these, for it is not afraid to set upon three men together, but if it can be turned upward upon the back, it is made weak and unresistible. And if the head be cut off

looff and severed from the body, it dieth not presently, nor closeth the eyes, for if a man shake his hand at it, then will it wink, but if he put it neer, it will also bite if it can reach it. If by the heat of the Sun their backs grow dry, they also grow weak and inflexible, and therefore they hasten to the water to remollifie them, or else they die within short time: and for this cause this is the best way to take them. In the hottest day they are drawn into the deep, where they swim willingly with their backs or shells above the water, where they take breath, and in continuance, the Sun so hardeneth them, that they are not able to help themselves in the water, but they grow very faint and weak, and are taken at the pleasure of the Fisherman.

Ælianus.

They are also taken on the tops of the water after they return weary from their feeding in the night-time, for then two men may easily turn them on their backs, and in the mean while another casteth a Snare upon them and draweth them safely to the land. In the *Phanician Sea* they are taken safely without danger, and generally where they may be turned on their back, there they can make no resistance, but where they cannot, many times they wound and kill the Fishermen, breaking the nets asunder, and let out all the other Fish included with them.

Belonius writeth, that there be of these Sea-tortoises two kinds, one long, the other round, and both of them breath at their Noses, because they want gills, and the long ones are most frequent about the Port *Totra* in the Red-sea, whose cover is variable, for the males shell is plain and smooth underneath, and the females is hollow. The *Turks* have a kinde of Tortoise, whose shell is bright like the *Chrysolite*, of which they make hafts for Knives of the greatest price, which they adorn with plates of gold. In *Fambolus*, an Island of the South, there are also found certain Monsters or living crea-

Boemus.

tures, which are not very great, yet are they admirable in Nature, and in the vertue of their blood. Their bodies are round and like the Tortoise, having two crosse lines over their backs, in the ends of which is an eye and an ear at either side, so as they seem to have four ears, the belly is but one, into which the meat passeth out of the mouth. They have feet round about, and with them they go both backward and forward. The vertue of their blood is affirmed to be admirable: for whatsoever body is cut asunder and put together, if it be sprinkled with this blood during the time that it breatheth, it counteth as before.

The ancient *Troglodytes* had a kinde of Sea-tortoise, which they call *Celtium*, which had horns unto which they fastened the strings of their harps; these also they worshipped and accounted very holy. Yet some think that they might better be called *Celutim* then *Celtium*; but I think *Hermolaus* doth better call them *Chelutim* apotes *Chelutur*, which signifieth both a Tortoise and their broad breasts: and with their horns they help themselves in swimming. *Albertus* also maketh mention of a Tortoise called *Barchora*; but it is thought to be a corrupt word from *Ostra Codermus*. These Sea-Tortoises are found sometimes to be eight cubits broad, and in *India* with their shells they cover houses, and such use they also put them unto in *Taprobana*, for they have them fifteen cubits broad. And thus much for all kinde kinde of Tortoises.

of the VIPER.

Notwithstanding the asse-
veration of *Suessanus*, who
will needs exclude the Viper
from the Serpents, because a
Serpent is called *Ophis*, and the
Viper *Echis*, yet I trust there
shall be no reasonable man that
can make exception to the
placing of this living creature
among Serpents; for that great
learned man was deceived in
that argument, seeing by the
same reason he might as well
exclude any other, as the Snake,
Dragon, Scorpion, and such
like, who have their peculiar
names, besides the generall
word *Ophis*, and yet might he
also have been better advised,
then to affirm a Viper not to be

Mercurialis.

called a Serpent: for even in *Aristotle* whom he expoundeth and approveth, he might have found in his fifth Book of *Gen. animal.* and the last Chapter, that the Viper is recorded, *Inter genera opheon*: that is, Amongst the general kinds of Serpents, although as we shall shew afterward, it differeth from most kinds of Serpents, because it breedeth the young one in his belly, and in the Winter time lyeth in the Rocks, and among stones, and not in the earth.

The *Hebrews* as it appeareth, *Esa. 59.* and *Job 6.* call it *Aphgnath*, and according to *Munster* *Aphgnaim* plurally for Vipers, because of the variety of colours, wherewithal they are set all over. The

Arabians,

Arabians from the Greek word *Tbereon*, signifying all kinde of wide Beasts, do also call it *Tbiron*, and that kinde of Viper whereof is made the Triacle, they call a *Alafasrai*, and *Alphai*: they also call it *Eosman*, (as *Leonicens* writeth.) Beside it is called *Alphe*, which seemeth to be derived of the Hebrews, and *Afir*, which may likewise be conjectured to arise from the Greek word *Ophis*. The Greeks call the Male peculiarly and properly *Echis*, and the Female *Echidna*, and it is a question whether the vulgar word among the Grecians at this day *Ochendra*, do not also signifie this kinde of Serpent. *Belonius* thinketh, that it is corrupted of *Echidna* the female Viper. The Germans have many words for a Viper, as *Brandt Schlangen*, *Natet-otter*, *Heck nater*, and *Viper-nater*. The French, *une Vipere*; the Spaniards, *Bivora*, and *Bicba*; the Italians, *Vipera*, *Marasso*, *Scurio*, and sometimes *Scorzoni*, although *Scorzo*, and *Scorzoni*, be general words in Italy for all creeping Serpents without feet, and that strike with their teeth.

There is also about the word *Maraso* some question, although *Leonicens* decideth the matter, and maketh it out of all Controversie, and *Rhodiginus* thinketh it a very significant word derived from the people *Marsi*, because they carryed about Vipers. The Mountebanks do also call *Suffili*, from *Sibila*, the hissing voyce which it maketh. Some will have *Nepa* to be also a Viper, yet we have shewed that already to signifie a Scorpion.

The Grecians say, that the Viper is called *Echidna*, *para to ecchein in eaute ten gonem achri thanaton*: because to her own death she beareth her young one in her belly; and therefore the Latines do also call it *Vipera*, *quasi Vi pariat*: because it dyeth by violence of her birth or young: and they attribute unto it venom and pestilence, and generally there are few Epithets which are ascribed to the Serpent, but they also belong unto this. There is a precious stone *Ecbites*, (greenish in colour) which seemeth to be like a Viper, and therefore taketh name from it. Also an herb *Echine*, like *Scammony*, and *Echidmon* or *Viperina*. In Cyrene there are Mice, which from the similitude of Vipers are called *Echenate*. *Echion* was the name of a man, and *Echionide* and *Echionii*, of people; and *Echidnon* a City beside the Sea *Ægeum*: Also the Eagle which by the Poets is fained to eat the heart of *Prometheus*, is likewise by them said to be begotten betwixt *Typhon* and *Echidna*, and the same *Echidna* to be also the Mother of *Chimera*: which from the Navel upward was like a Virgin, and downward like a Viper, of which also *Diodorus Siculus*, and *Herodotus* telleth this story:

When *Hercules* was driving away the Oxen of *Geryon* he came into *Scythia*, and there fell asleep, leaving his Mares feeding on his right hand in his Chariot, and so it happened by divine accident, that while he slept they were removed out of his sight and strayed away from him. Afterward he awaked, and missing them, sought all over the Countrey for them; at last he came unto a certain place, where in a Cave he found a Virgin of a double natured proportion, in one part resembling a Maid, and in the other a Serpent, whereat he wondered much, but she told him, that if he would lie with her in carnal copulation, she would shew him where his Mares and Chariot were: whereunto he consented, and begat upon her three Sons, famous among Poetical Writers: Namely, *Agathyrus*, *Gelonus*, and *Scythus*: but I will not prosecute either the names, or these fables any further, and so I will proceed to the description of Vipers. The colour of Vipers is somewhat yellowish, having upon their skin many round spots, their length about a cubit, or at the most three palms. The tail curled, at the end very small and sharp, but not falling into that proportion equally by even attenuation, growing by little and little, but unevenly sharped on the sudden from thickness to thinness. It is also without flesh, consisting of skin and bone, and very sharp. The head is very broad, compared with the body, and the neck much narrower then the head: the eyes very red and flaming, the belly winding, upon which it goeth all in length, even to the tail, and it goeth quickly and nimbly: some affirm that it hath two canine teeth, and some four. And there is some difference betwixt the male and female; the female hath a broader head; the neck is not so eminent, a shorter and thicker body, a more extended tail, and a softer pace, and four canine teeth. Again, the male hath a narrower head, a neck swelling or standing up, a longer and thinner body, and a swifter pace or motion, so that in the Pictures proposed in this discourse: the first of them are for the male, and the last for the female & this is the peculiar outward difference betwixt the male and the female Vipers. *Avicen* saith besides, that the tails of Vipers make a noise when they go or move. Those are taken to be the most generous and lively, that have the broadest and hollowest head like a Turbot, quick and lively eyes, two canine teeth, and a gristle or claw in the nose or tail; a short body or tail, a pale colour, a swift motion, and bearing the head upward. For the further description of their several parts. Their teeth are very long upon the upper chap, and in number upon either side four, and those which are upon the neather gum are so small, as they can scarce be discerned, until they be rubbed and pressed; but also it is to be noted, that while they live, or when they be dead, the length of their teeth cannot appear, except you take from them a little bladder, in which they lie concealed. In that bladder they carry poyson, which they infuse into the wound they make with their teeth: they have no ears, yet all other living creatures that generate their like, and bring forth out of their bellies have ears, except this, the Sea-calf, and the Dolphin, yet in stead hereof, they have a certain gristly cave or hollownesse in the same place where ears should stand. The womb and place of conception (saith *Pliny*) is double, but the meaning is, that it is cloven as it is in all females, (especially Women and Cows.) They conceive Egges, and those Egges are contained neer their reins or loins. Their skin is soft, yeelding also to any stroke; and when it is fleyed off from the body, it stretcheth twice so big as it appeared while it covered the living Serpent: To conclude, *Phylologus* writeth, that their face is somewhat like the face of a man, and from the navel

Navel it resembleth a Crocodile, by reason of the small passage it hath for his egestion which exceedeth not the eye of a Needle. It conceiveth at the mouth. And thus much for the description in general.

There is some difference among this kind also, according to the distinction of place wherein they live, for the Vipers in *Æthiopia* are all over black like the men, and in othes Countreys they differ in colour, as in *England*, *France*, *Italy*, *Greece*, *Asia*, and *Ægypt*, as writeth *Bellonius*. There is scarce any Nation in the World wherein there are not found some Vipers. The people of *Amyta* which were of the *Grecian* blood, drove away all kind of Serpents from among them, yet they had Vipers which did bite mortally; and therefore could never be cured, being shorter then all other kinds of Vipers in the World. Herodotus.

Likewise in *Arabia*, in *Syagrus*, the sweet Promontory of *Frankincense*, the *European* Mountaines, *Seiron*, *Pannonia*, *Aselenus*, *Corax*, and *Ripheus*: the Mountaines of *Asia*, *Ægages*, *Bucarteron*, and *Cercaphus*, abound with Vipers. Likewise *Ægypt*, and in all *Africa* they are found also, and the *Africans* affirm, (in detestation hereof) that it is not so much *Animal*, as *Malum nature*: that is, A living Creature, as evill of Nature: To conclude, they are found in all *Europe*. Some have taken exceptions to *Crete*, because *Aristotle* writeth, that they are not found there, but *Bellonius* affirmeth, that in *Crete* also he saw Vipers which the Inhabitants call by the name of *Cheudra*, which seemeth to be derived from the *Greek* *Echidna*. At this day it is doubted whether they live in *Italy*, *Germany*, or *England*, for if they doe, they are not knowne by that name: yet I verily think that we have in *England* a kinde of yellow Adder which is the Viper that *Bellonius* saw here, for I my selfe have killed of them, not knowing at that time the difference or similitude of Serpents, but since I have perceived to my best remembrance that the proportion and voyce of it did shew that it was a Viper. The most different kinds of Vipers are found in *Ægypt* and *Asia*.

Concerning the quantity, that is the length and greatnesse of this Serpent, there is some difference, for some affirme it to be of a cubit in length, and some more, some lesse. The Vipers in *Europe* are very small, in comparison of them in *Africa*, for among the *Troglodytes* (as writeth *Ælianus*) they are fifteen cubits long, and *Nearchus* affirmeth as much of the *Indian* Vipers; *Aristobulus* also writeth of a Viper that he saw one, which was nine cubits long, and one hand breadth: & some again (as *Strabo*) affirm, that they have seen Vipers of sixteen Cubits long, and *Nicander* writeth thus of the Vipers of *Asia*;

*Fert Asia ultra tres longis qui tractibus ulnas
Se tendunt, rigidum quales Bucarteron, atque
Ardus Agagus, & celsus Cercaphus intra
Se multos refouet.*

In English thus;

*Such as Asia yeelds in length, as are three elles,
In Bucarteron steepy rough, these Vipers flourish,
Hard Agagus and high Cercaphus cels,
Within their compasse many such do nourish.*

Others there be in *Asia* sixteen foot long, and some there be again twenty, as in the *Golden Castiglia*, where their heads are like the heads of Kids. There be some that make difference betwixt *Echis* and *Echidna*, because one of them when it biteth, causeth a convulsion, and so doth not the other, and one of them maketh the wound look white, the other pale, and when the *Echis* biteth you shall see but the impression of two teeth, and when the *Echidna* biteth you shall see the impression of more teeth. But these differences are very idle, for the variety of the pain may arise from the constitution of the body, or the quantity of the poyson, and so likewise of the colour of the wound, and it is already set down, that the *Echis* or Male Viper hath but two Canine teeth, but the other, namely, the *Echidna* hath four: thus saith *Nicander*; Scaliger.
Cardan.
Ælianus.

*Masculus emittit, notus color, ipse caninos
Binos perpetuo monstrat, sed femina plures.*

Which may be englished thus;

*The Male two canine teeth, whose colour well is known,
But in the Female more continually are shown.*

But yet the Male hath beside his Canine teeth, as many as hath the Female: and besides the Male is known from the Female, as the same *Nicander* writeth, because the Female when she goeth, draweth her tail as though she were lame, but the Male more manlike and nimble, holdeth up his head, stretcheth out his tail, restraineth the breath of his belly, setteth not up his Scales (as doeth the Female;) and besides, draweth out his body at length.

The Meate of these Vipers are green Hearbes, and also sometimes living Creatures: and namely, *Galen*. Hore-fies, *Cantharides*, *Pithiocampes*, and such other things as they can come by, for these are fit and convenient meat for them. *Aristotle* writeth, that sometimes also they eat *Scorpions*, and in *Arabia* they not onely delight in the sweet juyce of *Balsam*, but also in the shadow of the same. But above all kinds of drink, they are most insatiable of wine. Sometime they make but little folds, and sometime greater,

Aristotle. greater, but in their wrath their eies flame, they turn their tails and put forth their double tongue. In the winter-time as we have said already, they live in the hollow Rocks, yet *Pliny* affirmeth, that then also they enter into the earth, and become tractable and tangible by the hands of man, for in the cold weather they are nothing so fierce as they are in the hot, and in the Sommer also they are not at all times alike furious, but like to all other Serpents. They are most outrageous in the Canicular daies, for then they never rest, but with continual disquiet move up and down till they are dead or emptied of their poyson, or feel an abatement of their heat. Twice in the year they cast their skins, that is to say, in the Spring, and in the Autumn: and in the Spring time when they come out of their hole or winter lodgings, they help the dimnesse of their eye-sight by rubbing their eyes upon fennel. But concerning their copulation and generation, I find much difference among writers: wherefore in a matter so necessary to be known, I will first of all set down the opinion of other men, aswell Historians as Poets, and then in the end and conclusion, I will be bold to interpose my own judgment for the better information of the Reader. *Herodotus* in his *Thalia* writeth, that when the Vipers begin to rage in lust, and desire to couple one with another, the Male cometh and putteth his head into the mouth of the female, who is so insatiable in the desire of that copulation, that when the male hath filled her with all his seed-genital, and so would draw forth his head again, she biteth it off, and destroyeth her husband, whereby he dieth and never liveth more: but the female departeth and conceiveth her young in her belly, who every day according to natures inclination, grow to perfection and ripenesse, and at last in revenge of their fathers death, do likewise destroy their mother, for they eat out her belly, and by an unnatural issue come forth into the light of this world: and this thing is also thus witnessed by *Nicander*;

*Cum durum fugiens morsu ignescentis echidnae
Frendit echis, vel ubi servente libidinis aestu
Saevo dente sui refecat caput illa mariti:
Ast ubi post vegetam ceperunt pignora vitam,*

*Jam propinqua adsunt maturi tempora partus,
Indignam chari mortem ulciscencia patris,
Erosa misera nascuntur matris ab alvo.*

In English thus;

*When the male Viper gnasheth, avoyding females bite,
Whose fiery rage is all on ardent lust,
Yet when he burnes for copulation right,
Her cruel tooth doth Husband head off crush.*

*But yet alas, when seeds begins to live,
And birth of young ones ripen in her womb,
Then they for Fathers death a full revenge do give,
Eating forth their wretched mothes strong.*

Vnto this agreeth *Galen*, *Isidore*, *Plutarch*, *Aelianus*: and *Lucan* who writeth;

Viperei coeunt abrupto corpore nati

That is to say:

*The geniture of Vipers blood
Engender, breaking bodies good.*

Pliny agreeth with the residue for the death of the Male in carnal copulation, but he differeth in this, about the Female, affirming that when the young Vipers grow ripe and perfect in their Mothers belly, she casteth forth every day one for three daies together, (for her number is sometimes twenty) at last the other, impatient of delay, gnaw out her guts and belly, and so come forth, destroying their mother: And here is no great difference, for in the sum and destruction of Father and Mother they all agree, and *Saint Jerom*, *Saint Basil*, and *Horus* do agree and subscribe to the truth of these opinions. Thus we have shewed the opinions of the Ancient and first Writers: now it followeth that we should likewise shew the opinions of the latter Writers, which I will performe with as great brevity and perspicuity as I can. *Pierius* therefore writeth, that in his time there were Learned men desirous to know the truth, who got Vipers, and kept them alive, both Males and Females, by shutting them up safe where they could neither escape out, nor do harme, and they found that they engendred, brought forth, and conceived like other Creatures, without death or ruine of Male and Female.

Amatus Lusitanus also writeth thus. The Male and Female Viper engender by wreathing their tails together, even to the one half of their body, and the other half standeth upright, mutually kissing one another. In the Male there is a genital member in that part beneath the Navel, where they embrace, which is very secret and hidden, and against the same is the Females place of conception, as may appear manifestly to him that will look after the same; and therefore all the Philosophers and Physitians have been deceived, that have wrote they have conceived at their mouth, or that the Male perished at the time of engendering, or the Female at the time of her delivery. Thus saith *Amatus*.

Theophrastus he likewise writeth in this manner; The young Vipers do not eate out their way, or open with their teeth their Mothers belly, nor (if I may speak merrily) make open their own passage by breaking up of the doors of their Mothers womb, but the womb being narrow, cannot contain them; and therefore breaketh of it own accord: and this I have proved by experience, even as the same falleth out with the fish called *Acus*: and therefore I must crave pardon of *Herodotus*, if I affirm his relation of the generation of Vipers to be meerly fabulous. Thus far *Theophrastus*.

Apollonius

Apollonius also writeth, that many have seen the old Vipers licking their young ones like other Serpents.

Thus have I expressed the different judgements of sundry Authors both new and old touching *Cælius*. the generation of Vipers, out of which can be collected nothing but evident contradictions, and unreconcilable judgements, one mutually crossing another. So as it is impossible that they should be both true, and therefore it must be our labour to search out the truth, both in their words, and in the conference of other Authors. Wherefore to begin, thus writeth *Aristotle*. The Viper amongst other Serpents, almost alone bringeth forth a living creature, but first of all she conceiveth a soft egge of one colour, above the egges lieth the young ones folded up in a thin skin, and some-times it falleth out, that they gnaw in sunder that thin skin, and so come out of their mothers belly all in one day, for she bringeth forth more then twenty at a time.

Out of these words of *Aristotle*, evilly understood by *Pliny* and other ancient Writers, came that error of the young Vipers eating their way out of their mothers belly, for in stead of the little thin skin which *Aristotle* saith they eat thorough, other Authors have turned it to the belly, which was clean from *Aristotles* meaning. And another error like unto this, is that wherein they affirm, that the Viper doth every day bring forth one young one, so that if she hath twenty young ones in her belly, then also she must be twenty dayes in bringing of them forth.

The words of *Aristotle* from whence this error is gathered, are these, *Τέλει de en mia emera kathon, Τέλει de pleo be eikosi*, which are thus translated by *Gaza*, *Parit enim singulos diebus singulis, plures quam viginti numero*: That is to say, she bringeth forth every day one, more then twenty in number. But this is an absurd translation, and agreeth neither with the words of *Aristotle*, nor yet with his mind, for his words are these: *Parit autem una die singulos, parit autem plus quam viginti numero*. That is to say in *English*, she bringeth forth every one in one day, and she bringeth forth more then twenty: so that the sense of these words shall be; that the Viper bringeth forth her young ones severally, one at a time, but yet all in a day.

But concerning her number, neither the Philosopher, nor yet any man living, is able to define and set it down certain, for they vary, being sometimes more, and sometimes fewer, according to the nature of other living creatures. And although the Viper do conceive egges within her, yet doth she lay them after the manner of other Serpents, but in her body they are turned into living Vipers, and so the egges never see the sun, neither doth any mortal eye behold them, except by accident in the dissection of a female Viper when she is with young. I cannot also approve them that do write, that one, namely the Viper, among all Serpents, bringeth forth her young ones alive, and perfect into the world, for *Nicander* and *Grevinus*, do truly affirm, with the constant consent of all other Authors, that the horned Serpent called *Cerastes*, of which we have spoken already, doth likewise bring forth her young ones alive. And besides, *Herodotus* writeth of certain winged-Serpents in *Arabia*, which do bring forth young ones as well as Vipers, and therefore it must not be concluded with apparent falshood, that onely the Viper bringeth her young ones perfect into the world.

The like fable unto this, is that general conceit of the copulation together, betwixt the Viper and the Lamprey; for it is reported that when the Lamprey burneth in lust for copulation, she forsaketh the waters, and cometh to the Land, seeking out the lodging of the male Viper, and so joyneth herself unto him for copulation. He againe on the other side, is so tickled with desire hereof, that forsaking his own dwelling and his own kind, doth likewise betake himself unto the Waters and Rivers sides, where in an amorous manner, he hisseth for the Lamprey, like as when a young man goeth to meet and call his Love; so that these two creatures, living in contrary elements, the earth and the water, yet meet together for the fulfilling of their lusts in one bed of fornication. Upon which *Saint Basil* writeth in this manner: *Vipera infestissimum animal eorum quæ serpunt cum muræna congregitur, &c.* that is to say, the Viper a most pernicious enemy to all living creeping things, yet admitteth copulation with the Lamprey, for he forsaketh the Land, and goeth to the water-side, and there with his hissing voyce, giveth notice to the other of his presence, which she hearing, instantly forsaketh the deep waters, and coming to the Land, suffereth herself to be imbraced by that venomous beast. Also *Nicander* writeth thus thereof in his verses.

*Fama est, si modo vera, quod hæc sua pascua linquat,
Atque eat in siccum cogente libidine litus,
Et cum Vipereo coiens serpente gravetur,*

Which may be englished thus;

*Fame saith (if it be true) that she her feed forsakes,
I mean the shore, and goes upon dry land,
Where for her lust the Viper-male she takes,
In fleshy coiture to be her husband.*

But this opinion is vaine and fantastick, as *Pliny* and divers others have very learnedly proved, for the Lamprey cannot live on the Land, nor the Viper in wet places, besides the waters: and therefore, besides the impossibility in nature, it is not reasonable that these will hazard their own lives, by forsaking their own elements for the satisfaction of their lusts, there being plenty of either kinds to work upon, that is to say, both of female Vipers in the Land, to couple with the male, and male Lampreys in the water, to couple with the female.

Although

Although I have else-where confuted this error, yet I must here again remember that which is said already. The occasion of this fable is this; the male Lamprey is exceeding like a Viper, for they want feet, and have long bodies, which some one by chance seeing in copulation with his female, did rashly judge it to be a Serpent because of his likenesse, as afore-said; and therefore they devised a name for it, calling it *Myrus*, which some have made a kind of Viper, and others a Snake: but *Andreas* hath notably proved against *Archelaus*, that this *Myrus* neither is nor can be any other then the male Lamprey: and so I will conclude, that neither Vipers ingender with Lampreys, nor yet the female Vipers kill the male in copulation, or that the young ones come into the world by the destruction of their dams.

Ælianus.

In the next place we are to consider, the antipathy and contrariety that it observeth with other creatures, and the amity also betwixt it and others. First of all therefore it is certain and well known, what great enmity is betwixt man-kind and Vipers, for the one alwaies hateth and feareth the other: wherefore, if a man take a Viper by the neck, and spit in his mouth, if the spittle slide down into his belly, it dieth thereof, and rotteth as it were in a consumption. Vipers also are enemies to Oxen, as *Virgil* writeth, *Pestis acerba bonum pecorique aspergere virus*: that is, a sharp plague of Oxen, casting his poyson upon all other Cattel. They are also enemies to Hens and Geese, as *Columella* writeth, wherefore in ancient time they were wont to make sure walls for the custody of their pullen against Vipers. They are likewise enemies to the Dormouse, and they hunt very greedily after their young ones, whereof *Epiphanius* in a discourse against *Origen* writeth thus; When the Viper cometh to the nest of a Dormouse, and findeth there her young ones, she putteth out all their eies, and afterwards feedeth them very fat, yet killeth every day one, as occasion of hunger serveth; but if in the mean time a man, or any other creature do chance to eate of those Dormice, whose eies are so put out by the Viper, they are poysoned thereby. And this is a wonderfull work in nature, that neither the little Dormice receive harme by the poyson, but grow fat thereby, nor yet the Viper be poysoned herself while she eateth them, and yet a man or beast which is a stranger unto it, dieth thereof.

Strabo.

All kind of Mice are as much afraid of Vipers, as they be of Cats, and therefore whensoever they heare the hissing of a Viper, instantly they look to themselves and their young ones. There is a kind of harmelesse Serpents called *Parea*, whereof I have spoken before in his proper place, which is an enemy unto Vipers, and that same which is harmelesse unto men, killeth them. *Albertus* also telleth a story of a Viper that climbed up into a tree, to the nest of a Magpye, where-upon the old one was sitting, this poore Pye did fight with the Viper, untill the Viper took her fast by the thigh, so as she could fight no more, yet she ceased not to chatter and cry out to her fellowes to come and help her, whereupon the male Pye came, and seeing his female so griped by the Viper, he ceased not to peck upon his head untill the braines came out, and so the Viper fell down dead. This story is also alledged by *Cardan*.

The Scorpions and the Vipers are enemies one to another, for at Padua a Viper and a Scorpion (for the trial of this matter) were both included in a vial, where they continued fighting a little while, but at last they both died by one anothers poyson. The Tortoyse of the earth is also an enemy to the Viper, and the Viper to it, wherefore if it can get Origan, or wild-Savory, or Rue, it eateth thereof, and then is nothing afraid to fight with the Viper, but if the Tortoyse can find none of these, then they die incontinently by the poyson of the Viper, and of this there hath been triall, as both *Aristotle* and other Authors affirm.

Ælianus.

And as there is this contrariety betwixt Vipers and other living creatures, so there is betwixt them and Plants of the earth, and this blessing God in nature hath bestowed upon many beasts, that when they feel themselves to be hurt by one herb, they know another to cure them; as for example, Garlick is poyson to the Viper, and therefore having tasted thereof she dieth, except she eat some Rue. A Viper being strook with a Reede once, it amazeth her, and maketh her senselesse, but being strook the second time, she recovereth and runneth away: and the like is reported of the Beech-tree, saying that it stayeth the viper, and she is not able to go from it. But most marvailous is the antipathy betwixt the Viper and the Yew-tree, for it is reported by *Mercuriall*, that if you lay fire on the one side, and a peece of Yew on the other side, and then place a viper in the middle betwixt them both, she will rather chuse to runne thorow the fire, then to go over the branches of Yew.

Galen.

The Viper is also afraid of Mustard-seed, for it beeing laid in her path, she flieth from it, and if she taste of it, she dieth. There is an herbe called *Arum*, if the hands or body of a man be anointed with the juyce of the root thereof, the viper will never bite him; the like is reported of the juyce of Dragons, expressed out of the leaves, fruit or root. It is also said, that if a viper do behold a good Smaradge, her eyes will melt and fall out of her head. But above all other plants in the world, the Viper is most delighted with Vetches, and the Savyne tree, for in Italy (as *Cardan* writeth) there was once seen a great number of Vipers about a Savyne Tree, and many of them did climbe up and down upon that Tree.

*Discorid.
Rasus,*

There is no love betweene this Serpent and other creatures, save onely to his own kind, and therefore there are two things memorable in the nature of this savage Serpent, the one is the love of the male to the female, and the other of the female to her young ones. It is reported by Saint *Ambrose* and Saint *Basill*, that when the male misseth the female, he seeketh her out very diligently, and with a pleasing and flattering noyse, calleth for her, and when he perceiveth she approacheth, he casteth up

up all his venome, as it were in reverence of matrimonial dignity. The female on the other side, maketh much of her young ones, licking and adorning their skins, fighting for them unto death, both against men and beasts. For this occasion and some medicinal uses, the Arabians counted Vipers holy Serpents, for by reason (as we have said already) that the Vipers do haunt the Balsom-trees, whereof there be plenty in that countrey, they hold them for holy keepers of that precious fruite; wherefore they never kill them, but at the time of year when the Balsom is ripe, they come unto the trees bearing in their hands two wooden rules, which they smite one against another, by the noise whereof the Vipers are terrified and driven away, and so the Trees are freed for the Inhabitants to take the fruite thereof at their pleasure.

Now forasmuch as we read that *Porus* King of India sent many great Vipers for a gift unto *Augustus*, it is profitable to expresse the meanes whereby Vipers are safely taken without doing any harme. Wherefore *Aristotle* writeth, that they are very much desirous of Wine, and for that cause the Country-people set little vessels of wine in the hedges and haunts of Vipers, whereunto the Vipers coming, easily drink themselves tame, and so the Hunters come and kill them, or else so take them, as they are without danger of harm. *Pliny* reporteth, that in ancient time, the *Marsians* in *Lybia* did hunt Vipers, and never received harm of them, for by a secret and innate vertue, all Vipers and serpents are afraid of their bodies, as we have already shewed in other places. Yet *Galen* in his discourse to *Piso*, writeth that the *Marsians* in his time had no such vertue in them, as he had often tried, save onely that they used a deceit or sleight to beguile the people, which was in this manner following.

Long after the usual time of hunting Vipers, they use to goe abroad to take them, when there is no courage nor scant any venom left in them, for the Vipers are then easily taken if they can be found: and them so taken, they accustome to their own bodies, by given them such meats as doth evacuate all their poison, or at the least-wise doth so stop up their teeth, as it maketh the harm very small; and so the simple people being ignorant of this fraud, and seeing them apparently carrying Vipers about them, did ignorantly attribute a vertue to their natures, which in truth did not belong unto them. In like manner there were (as hath already in another place been said) certain Jugglers in *Italy*, which did boast themselves to be of the lineage of Saint *Paul*, who did so deceitfully carry themselves, that in the presence and sight of many people, they suffered Vipers to bite them without any manner of harm.

Others again when they had taken a Viper, did drown her head in mans spittle, by vertue whereof the Viper began to grow tame and meek. Besides this, they made a certain oyntment which they set forth to sale, affirming it to have a vertue against the biting of Vipers, and all other Serpents, which oyntment was made in this manner. Out of the oyl of the seed of Wild-radish, of the roots of Dragons, the juyce of *Dassadil*, the brain of a Hare, leaves of Sage, Sprigs of Bay, and a few such other things, whereby they deceived the people, and got much money: and therefore to conclude, I cannot find any more excellent way for the taking and destroying of Vipers then that which is already expressed in the general discourse of Serpents.

We do read that in *Egypt* they eat Vipers and divers other Serpents, with no more difficulty then they would do *Eeles*, so do many people both in the Eastern and western parts of the New-found-lands. And the very self-same thing is reported of the Inhabitants of the Mountaine *Athos*, the which meat they prepare and dresse on this manner. First they cut off their heads and also their tails, then they bowel them and salt them, after which they see the them or bake them, as a man would see the or bake *Eeles*, but sometimes they hang them up and dry them, and then when they take them down again, they eat them with Oyl, Salt, Anyseeds, Leeks and water, with some such other observations. Whose diet of eating Vipers I do much pity, if the want of other food constrain them thereunto; but if it arise from the insatiable and greedy intemperancy of their own appetites, I judge them eager of dainties, which adventure for it at such a market of poyson.

Now it followeth that we proceed to the handling of that part of the Vipers story, which concerneth the venom or poison that is in it, which must begin at the consideration of temperament of this Serpent. It is some question among the learned, whether a Viper be hot or cold; and for answer hereof it is said, that it is of cold constitution, because it lieth hid, and almost dead in the Winter-time, wherein a man may carry them in his hands without all hurt or danger: and unto this opinion for this self same reason, agreeth *Galen*. *Mercuriall* maketh a treble diversity of constitution among Serpents, whereof the first sort are those that with their wound do infuse a mortal poyson that killeth instantly; and without delay: a second sort are those that kill, but more leisurely, without any such speed: and the third are those whose poyson is more slow in operation then is the second, among which he assigneth the Viper. But although by this slowness of operation he would inforce the coldness of the poyson, yet it is alwaies to be considered, that the difference of Vipers, and of their venom, ariseth from the place and region in which they are bred, and also from the time of the yeer wherein they bite and wound, so that except they fortune to hurt any one during the time of the Canicular daies, (in which season their poyson is hottest, and themselves most full of spirit) the same is but weak, and full of deadness. And again it is to be considered, whether the Viper harm in her mood and fury, for anger doth thrust it forth more fully, and causeth the same to work more deadly.

Likewise the Region wherein they live, begetteth a more lively working spirit in the Serpent, and therefore before all other, the Vipers of Numidia are preferred, because of the heat of that Country. Also their meat causeth in them a difference of poyson, for those that live in the woods and eat Toades, are not so vigorous or venomous, but those that live in the mountaines, and eat the roots of certain herbs, are more poysonful and deadly. And therefore Cardan relateth a story, which he saith was told him by a *Phenician*, that a Mountain-Viper chased a man so hardly, that he was forced to take a tree, unto the which when the Viper was come, and could not climbe up to utter her malice upon the man, she emptied the same upon the Tree, and by and by after, the man in the tree dyed, by the favour and secret operation of the same.

Pausanias.

But of the *Arabian* Vipers which haunt the Balsom-trees, I have read, that if at any time they bite, they onely make a wound, like the pricks of yron, voide of poison, because while they suck in the juyce of that tree, the acerbity and strength of the venom is abated. About the Mountain *Helicon* in Greece, the poison also of Vipers is infirme and not strong, so that the cure thereof is also ready and easie. But yet for the nature of Vipers poison, I can say no more then *Wolphius* hath said, that it is of it self and in it selfe considered, hot: and his reason is, because he saw a combat in a glasse betwixt a Viper and a Scorpion, and they both perished one by the others poison. Now he saith that it is granted, the Scorpion to be of a cold nature, and his poison to be cold; therefore by reason of the antipathy whereby one died by the malice of another, it must needs follow that the Viper is hot, and her poison likewise of the same nature. For a Serpent of a cold nature, killeth not another of the same nature, nor a hot Serpent, one of his own kind, but rather it falleth out clean contrary, that the hot kill those that are cold, and the cold Serpents the hotter.

*Pliny.
Nicander.*

All the Vipers that live neer the waters, are of more mild and meek poison then others. If there be any such, but I rather beleve there be none, but that the same Author which wrote of the Vipers of the water, did intend Serpents of the water. But concerning the poison of Vipers, there is nothing reported more strange then that of *Vincentius Belluacensis*, who writeth, that if a man chance to tread upon the reynes of a Viper unawares, it paineth him more then any venome, for it spreadeth it self over all the body incurably. Also it is written, that if a woman with child chance to passe over a Viper, it causeth her to suffer abortment; and the Mushrooms or Toade-stooles which grow neere the dennes and lodgings of Vipers, are also found to be venomous.

The Scythians also do draw an incurable and unresistable poison out of Vipers, wherewithall they anoint the sharp ends of their darts and arrowes when they goe to warre, to the end that if it chance to light upon their adversary, he may never any more do them harm. They make this poison in this manner. They observed the littering places and time of the Vipers, and then with strength and Art, did take the old and young ones together, which they presently killed, and afterward suffered them to lie and rot, or soake in some moist thing for a season: then they took them and put them into an earthen pot filled with the bloud of some one man; this pot of mans bloud and Vipers they stopped very close, so as nothing might issue out at the mouth, and then buried or covered it all over in a dunghil, where it rotted and consumed a few daies, after which they uncovered it again, and opening it, found at the top a kind of watery substance swimming, that they take off, and mixe it with the rotten matter of the Viper, and hereof make this deadly poison.

We have shewed already, that there is outwardly a difference betwixt the biting wound of the Male and the Female Viper, for after the male hath bitten, there appeareth but two holes, but after the Female hath bitten, there appeareth foure; and this is also a great deal more deadly then is the biting of the male, according to the verses of *Nicander* where he saith,

*Porro ex Vipereo quod noris germine pejor
Famina: quæ veluti majori accenditur ira,
Sic vehemente magis fert noxia vulnera morsu,*

*Et plus gliscenti se cauda & corpore volvit,
Vnde citatior hæc illos mors occupat artus.*

Which may be englished thus;

*But of the Vipers brood the female is the worst,
Which as it were, with greater wrath doth burn: (curst
And therefore when she bites, makes bodies more ac-*

*Inflicting hurtful wounds, to vehemency turnd.
Rowling her bulke and taile more oft about,
Whereby a speedier death doth life rid out.*

But *Avicen* is directly contrary to this opinion, and saith, that as the bitings of male Dragons are more exitiall and harmful then are the females, so is it betwixt the biting of the male and female Viper. This contrarietie is thus reconciled by *Mercuriall*, namely, that it is true, that the wounds which the female maketh by her biting, being well considered, is more deadly then the wounds which the male giveth: yet for the proportion of the poison which the male venteth into the wound he maketh, it is more deadly then is the females: so that with respect of quantity: they both say true which affirm either the one or the other. But which soever is the greatest, it skilleth not much, for both are deadly enough, as may appear by the common symptoms and signes which follow, and also death.

Mathiolus reporteth a history of a Country-man, who as he was mowing of grasse, chanced to cut a Viper clean asunder about the middle, or some-what nearer the head, which being done, he stood still, and looked upon the dying dissevered parts a little while, at last, either presuming that it had no power left to hurt, or thinking it was dead, he took that part in his hand where-upon the head was: the angry Viper feeling his adversaries warm hand, turned the head about, and bit his

his finger with all the rage, force, and venom that it had left, so that the blood issued out. The man thus bitten for his boldnesse, did hastily cast it away, and began to suck the wound, putting his hand to his mouth, which when he had done but a little while, he suddenly fell down dead.

The like story unto this, is related by *Amatus Lusitanus* of another, which more boldly then wisely, did adventure to take a live Viper into his hand upon a wager of money, but as the other, so this paid for his rashnes, for the angry Viper did bite him as did the former, and he sucked his wound as did the Country-man, and in like manner fell down dead.

By both which examples, we may well see the danger of the Vipers poison, so that if once it come into the stomach, and touch the open passage where the vitall parts goe in and out, it never stayeth long but death followeth. Wherefore *Aetius* saith well, that sometimes it killeth within the space of seven houres, and sometimes again within the space of three daies, and that respite of time seemeth to be the longest, if remedie be not had with more effectual speed.

The signes or effects of the Vipers biting, are briefly these, first there issueth forth a rotten matter, sometimes blou dy, and sometimes like liquid or molten fatnesse, sometimes again with no colour at all, but all the flesh about the sore swelleth, sometimes having a red, and sometime a pale hiew or colour upon it, issuing also forth a corrupted matter. Also it causeth divers little blisters to arise upon the flesh as though the body were all scorched over with fire, and speedily after this, followeth putrefaction and death.

The pain that cometh by this Serpents wounding, is so universal, that all the body seemeth to be set on fire, many pitiful noyses are forced out of the parties throat by sense of that pain, turning and crackling of the neck, also twinkling and wrying of the eyes, with darknesse and heavinesse of the head, imbecillity of the loynes, sometimes thirsting intolerably, crying out upon his dry throate, and again sometimes freezing at the fingers ends, at least so as he feelerh such a pain. Moreover, the body sweating a sweat more cold then snow it self, and many times vomiting forth the bilious tumors of his owne belly. But the colour going and coming is often changed, now like pale lead, then like black, and anon as green as the rust of brasse, the gums flow with blood, and the Liver it self falleth to be inflamed, sleepinesse and trembling possesseth the body and several parts, and difficulty of making urine, with Feavers, neezing and shortnesse of breath.

These are related by *Aetius*, *Aegineta*, *Grevinus* and others, which work not alwaies in every body generally, but some in one, and some in another, as the humors and temperament of nature doth lead, and guide their operation. But I marvel from whence *Plato* in his *Symposium* had that opinion, that a man bitten and poisoned by a Viper, will tel it to none, but onely to those that have formerly tasted of that misery: for although among other effects of this poison, it is said that madness, or a distracted mind also followeth, yet I think in nature there can be no reason given of *Platoes* opinion, except he mean that the patient will never manifest his grief at all. And this howsoever also is confuted by this one story of *Grevinus*. There was (as he writeth) a certain Apothecary which did keep Vipers, and it happened one day as he was medling about them, that one of them caught him by his finger, and did bite him a little, so as the prints of his teeth appeared as the points of needles. The Apothecary onely looked on it, and being busied, either forgot, or (as he said afterward) felt no pain for an hours space: but after the hour, first his finger smarted and began to burn, and afterward his arm and whole body fell to be suddenly distempered therewith, so as necessity constraining him, and opportunity offering it self, he sent for a Physitian at hand, and by his good advise. (thorow Gods mercy) was recovered, but with great difficulty; for he suffered many of the former passions and symptoms before he was cured.

Therefore by this story, either *Plato* was in a wrong opinion, or else *Grevinus* telleth a fable, which I cannot grant, because he wrote of his own experience, known then to many in the world, who would quickly have contradicted it: or else if he had consented to the opinion of *Plato*, no doubt but in the relation of that matter, he would have expressed also that circumstance.

Thus then we have, as briefly and plainly as we can, delivered the pains and torments which are caused by the poison of Vipers; now therefore it followeth, that we also briefly declare the vertue of such Medicines, as we find to be applied by diligent and careful observations of many learned Physitians, against the venom of Vipers. First of all they write, that the general rule must be observed in the curing of the poison of Vipers, which is already declared against other Serpents: namely, that the force of their poison be kept from spreading, and that may be done either by the present extraction of the poison, or else by binding the wounded member hard, or else by cutting it off, if it be in finger, hand or foot.

Galen reporteth, that when he was in *Alexandria*, there came to the City a Countryman which had his finger bitten by a Viper, but before he came, he had bound his finger close to the palm of his hand, and then he shewed the same to a Physitian, who immediatly cut off his finger, and so he was cured. And besides he telleth of another country-man, who reaping of Corne, by chance with his sickle did hurt a Viper, who returned and did raze all his finger with her poisonfull teeth. The man presently conceiving his own peril, cut off his own finger with the same sickle, before the poison was spred too far, and so was cured without any other Medicine.

Sometime it hapneth that the bite is in such a part that it cannot be cut off, and then they apply a Hen cut in sunder alive, and laid to as hot as can be, also one must first wash and anoint his mouth with oyl, and so suck out the poison. Likewise the place must be scarified, and party fed and dieted with old Butrer, and bathed in milk or Seawater, and be kept waking, and made to walk up and down.

In Viper.

It were too long, and also needlesse, to expresse all the medicines which by naturall meanes are prepared against the poison of Vipers, whereof seeing no reasonable man will expect that at my hands; I will onely touch two or three cures by way of history, and for others, refer my Reader to Physitians, or to the Latine discourse of *Caronius*. In *Norcheria*, the country of that great and famous *Gentilis* who translated *Avicen*, there is a fountaine, into which if any man be put that is stung or bitten by a Serpent, he is thereof immediatly cured; which *Amatus Lusitanus* approveth to be very natural, because the continual cold water killeth the hot poison. The same Author writeth, that when a little maid of the age of thirteen yeeres, was bitten in the heel by a Viper, the legge being first of all bound at the knee very hard, then because the maid fell distract first he caused a Surgeon to make two or three deeper holes then the Viper had made, that so the poison might be the more easily extracted, then he scarified the place, and drew it with cupping-glasses, whereby was exhausted all the black blood, and then also the whole leg over, was scarified and blood drawn out of it, as long as it would run of it own accord. Then was a plaister made of Garlick, and the sharpest Onions roasted, which being mixed with Triacle, was laid to the bitten place. Also the maid drank three daies of Treacle in wine, and foure houres after a little broth made with Garlick.

The second day after the abatement of the pain, he gave her the juyce of Yew-leaves fasting, which he commendeth as the most notable Antidote in this kind, and so made a second plaister, which lay on three days more, and in the mean time she drank fasting every day that juyce of Yew-leaves, whereby her trembling and distracted estate was abated, but from the wounded place still flowed matter, and it looked black. Then the four next daies, the said matter was drawn out by a linnen cloth, wherein was Goates dung, powder of Lawrell, and *Euphorbium* in Wine, all mixed together, and afterward he made this ointment, which did perfectly cure her, *Rec*: of long *Aristolochii* two ounces, of Briony and Daffadil one ounce, of Galbanum and Myrrhe, of each one ounce, with a convenient quantity of oyle of Baies and Waxe. This applied to the bitten place in a linnen cloth, and tentures twice a day, did perfectly recover her health within a month.

Ambrosius Paracelsus cured himselfe, with binding his finger hard that was bitten, and applying to it Triacle dissolved in *Aqua vite*, and drunk up in lint or bumbast: and he adviseth in stead of old Triacle, to take Mithridate. *Gesner* saith, that he saw a maid cured of the eating of Vipers flesh, by being constrained to drink Wine abundantly. *Theophrastus* and *Asclepiades* do write, that many are cured by the sound of good Musick, as the like is already shewed, in the cure of the poison of the *Phalangium*: and no marvail, for *Ismenias* the Theban affirmeth, that he knew many in *Beotia*, that were cured of the Sciatica, by hearing of the musical sound of a good pipe.

Of the Medicines which may be made of the Viper.

THE eating of Vipers is an admirable remedy against the Leprosie. And being prepared after that sort as was mentioned immediatly before in the former Section, they are ministred to the sick person sitting in the sun, yet his head must be well covered or shadowed. Neither indeed to eat Vipers once alone, or twice is sufficient, but it must be done often, sith it is without danger, and moreover bringeth great commodity. And let the Vipers be new, and taken out of moist places, for those which are bred neer the Sea, are very thirsty and dry. The broth also of sod Vipers, is for such persons good supping meat.

The flesh of Vipers is in temperature apparantly hot and dry, and purgeth the whole body by sweat; here-upon many sore tormented with Leprosie, by eating and drinking them have been cured.

Averroes saith, the flesh of *Tyrus* clenseth Leprosie, because it driveth the matter thereof to the skin, and therefore they that drink it, fall first into the passion of *Tyria*, that is, the pilling of the skin, and after are cured of it.

Funamellus.

Chuse the Vipers of the Mountain, especially being white, and cut off their heads and tails at once very speedily, and then if the issue of blood be plentiful, and they continue alive, and wallow to and fro a long time, these are good. After their beheading, let them be made clean and sod, and let the diseased party eat of them, and of their broth.

And by the drinking of wine wherein a Viper dieth or liveth, certain have been cured accidentally, or by an intent to kill them.

Avicen.

Amatus.

The Leaper must first drink the broth of Vipers decocted, in manner as afore-said, then let him eat the flesh, no otherwise then as mutton or fowles, which daily men dine with, but fasting and in the morning this flesh must be eaten, half a Viper at once, and sometime a whole Viper, according to the strength of the party diseased. After the eating whereof, he must not eat or drink in the space of six houres: but if he doe sweat, it is most expedient that in his sweat he look to himself very carefully. And the skin is wont to flea off from the Leaper, as it usually befalleth Serpents.

Galen.

A man may easily see the flesh of Vipers to be hot and dry, when they are dressed as Eels. And that they purge the whole body thorow the skin, (thou mayest learne even by those things, which my self being a young man, had experience of in our Countrey of *Asia*, which thing severally and in order I shall relate.

A certain man infected with the disease which men call *Elephas*, that is, Leprosie, for a time conversed still with his companions, till by his company and conversation, some of them were infected with the contagion of the disease, and he now became lothsome to smell, and filthy to sight. Building therefore

therefore a cottage for him neer the Village, on the top of a bank, hard by a Fountain, there they place this man, and daily bring to him so much meat as was sufficient to sustain life. But at the rising of the Dog-star, when by good hap, Reapers reaped not far from that place, very fragrant Wine was brought for them in an earthen vessel: he that brought it, set it down neer the Reapers, and departed; but when the time was come that they should drink it, a young man taking up the vessel, that according to their manner having filled a bowl, he might mingle the Wine with a competent measure of water, he poured the Wine into the bowl, and together with the Wine fell out a dead Viper.

Wherefore the Reapers amazed thereat, and fearing lest if they drank it, they should receive some harm thereby, chose rather indeed to quench their thirst by drinking water: but when they departed thence, of humanity and in piety, gave the Wine to this Leper, supposing it to be better for him to die, then to live in that misery. Yet he when he had drunk it, in a wonderful manner was restored to his health: for all the scurf of his skin fell off as the shales of tender shelled creatures, and that which remained, appeared very tender, as the skin of Crabs or Locusts, when their outward shell is taken away.

Another example by a chance not much unlike, hapned in *Mysia*, a Countrey of *Asia*, not far from our City. A certain Leper went to wash himself in Spring-water, hoping thereby to receive some benefit. He had a maid-servant, a very fair young woman, importuned by divers sisters: to her the sick man committed both certain other things pertaining to the house, and also the store-house. When they therefore were gone into the room, to which a filthy place and full of Vipers adjoyned, by chance one of them fell into a Vessel of Wine there negligently left, and was drowned. The Maid esteeming that a benefit which Fortune offered, filled that Wine to her Master, and he drank it, and thereby in like sort as he that lived in the Cottage, was cured.

These are two examples of experiment by casual occasion. Moreover, I will adde also a third, which proceeded from our imitation. When one was sick of this disease, in minde more then the common sort Philosophical, and despising death, took it exceeding grievously, and said it were better once to suffer death, then to live so miserable a life: and drinking Wine so mingled with poyson, he became a Leper; and afterward we cured his Leprosie by our accustomed medicines.

Also a fourth man took Vipers alive, but that man had only the beginning of this disease; therefore our care and industry was very speedily to restore him to health: wherefore having let him bloud, and by a medicine taken away melancholy, we bad him use the Vipers he had taken, being prepared in a pot after the manner of Eels. And he was thus cured, the infection evaporating through the skin.

Lastly also, a certain other man very rich, not our Country-man, but of the middle of *Thracia*, admonished by a dream, came to *Pergamus*, where God commanded him by a dream, that he should daily drink the medicine which was made of Vipers, and outwardly he should anoint his body, and not many days after, his disease became the Leprosie: And again also, this infirmity was afterward cured by the medicines which God commanded.

Matthew Grady fed Chickins and Capons with the broth and flesh of Vipers mingled with bread, *Galen*. till they cast their feathers, purposing by them to cure the Leprosie.

A certain Noble-woman in this City, infected with this malady (the Leprosie) after divers unfortunate attempts of many, came to my hands, in whose cure, when generous medicines availed nothing, at last, with consent of her husband, I purposed to try her with Vipers flesh: whereupon a female Viper being cleansed and prepared after that sort as *Galen* prescribeth in his Book *De Theriaca*, mingling the flesh of the Viper with Galangal, Saffron, &c. I sod her very well: then I took a Chicken, which I commanded well to be sod in the juyce and broth of the Viper. And lest she should take any harm thereby, I first ministred unto her Mithridate, then the Chicken with the broth, by eating whereof she said she felt herself better: Which when I saw, I took another male Viper, whom I sod alone without adding any other thing, and the broth thereof I ministred to her three days, whereupon she began to sweat extreamly, the sweat I restrained by syrup of Violets and pure water. After six days, scales fell from her, and she was healed. Moreover, she soon after conceived a man-childe, having been barren before the space of forty years.

Antonius Musa a Physitian, when he met with an incurable Ulcer, he gave his patients Vipers to eat, and cured them with marvailous celerity. When the servants of *Craterus* the Physitian fell into a strange and unusual disease, that his flesh fell from his bones, and that he had proved many medicines which profited him nothing, he was healed by eating a Viper dressed as a fish.

Vipers flesh if it be sod and eaten, cleareth the eyes, helpeth the defects of the sinews, and representeth swellings. *Porphyrius*.

They say they that eat Vipers become lousie, which is not so, though *Galen* affirm it. Some adde them to live long who eat that meat, to wit, Vipers. *Isogorus* affirmeth the *Cirni*, a kinde of *Indians*, to live an hundred and forty years. Also he thinketh the *Ethiopians*, and *Seres*, and the Inhabitants of Mount *Athos* to be long lived, because they eat Vipers flesh. *Dioscorides*.

The *Seythians* cleave the head of the Viper betwixt the ears, to take out a stone, which they say *Pliny*. she devoureth when she is affrighted.

The heads of Vipers burnt in a pot to ashes, and after beaten together with the grossest decoction of bitter Lupines, & spread as an ointment on the temples of the head stayeth the continual rheume of the

the eys. Their ashes lightly beaten alone, and applyed as a dry medicine for the eys, greatly amendeth a dim sight.

Aetius.

The head of a Viper kept dry and burned, and after being dipped in Vinegar and applyed, cureth wilde fire.

Albertus.

The gall of the Viper doth wonderfully cleanse the eye, and offendeth not by poyson. It is manifest against the stinging of all Serpents though incurable, that the bowels of the very Serpents do help and avail; and yet they who at any time have drunk the liver of a sod Viper, are never stung of Serpents.

Pliny.

The fat of a Viper is effectual against the dimnesse and suffusions of the eyes, mixed with Rosin, Honey-attick, and a like quantity of old Oil.

For the Gowt they say it availeth much to anoint the feet with the fat of Vipers. Vipers fat healeth them that are burned.

Galen.

The flow of the Viper cureth the Ring-worm. The skin of the Viper beaten to powder, and laid upon the places where the hair is fallen, it doth wonderfully restore hair again.

Aetius.

Some extend and dry whole Vipers, and after beat them to powder, and minister them in drink against the Gowt. Others about the rising of the Dog-star, cut off the head and tail of Vipers, and burn the middle, then they give those ashes to be drunk 21. days, so much at a time as may be taken up with three fingers, and so cure the swelling in the neck. Joynts pained with the Gowt, are profitably anointed with Oyl wherein a Viper hath been sodden, for this cureth perfectly.

Leonell.

Faventin.

The making of the Oyl of Vipers, is described in these words; Take three or four Vipers, cut off their extreame parts, the head and the tail, in length four fingers, divide the rest into four gobbets, and put them in a pot open above and below, which pot must be put into another greater pot; then the mouth of them must be well shut with clay, that they breath not forth; then put them into a Caldron full of seething water, and there let them continue boiling two hours in those pots: then will distill a liquor from the Vipers, which were in the pot open above and below, with that Oily liquor anoint the members of the party molested with the Palsie, for by a secret property it cureth the grief of that disease.

Of Triacle and Trochusks of Vipers.

Galen.

Theriace or *Triacle*, not only because it cureth the venomous biting of Serpents, but also because the Serpents themselves are usually mingled in the making thereof, fitly is so named of both significations. Here also we will insert something concerning *Trochusks* of Vipers, which are mingled in the making of *Triacle*.

Triacle is very ancient, and hath always very carefully, and not without ambition, been refined by the Physitians, till *Andromachus Nero* his Physitian, added the flesh of Vipers, as the full accomplishment of this drug. The flesh of Vipers alone is mingled in *Triacle*, and not the flesh of other Serpents, because all the rest have something malignant more then Vipers. Vipers are thought to have lesse poyson in them then other Serpents.

Vipers for *Triacle* must not be taken at any time, but chiefly in the beginning of the Spring, when having left their dens, they come forth into the Sun-shine, and as yet have not poyson much offensive.

Avicen.

Take female Vipers, for we must take heed how we take male Vipers for the confection of *Antidotes*. For *Trochusks* all Vipers are not convenient, but those which be yellow, and of the yellow, the females only.

Galen.

Vipers great with young you must refuse, for being pregnant, they are more exasperate then themselves at other times.

Aetius.

Of Vipers be made *Trochiscs*, which of the *Grecians* are called *Theriaci*, four fingers being cut off at either end, and the inwards taken out, and the pale matter cleaving to the back-bone: the rest of the body must be boiled in a dish in water, with the herb *Dill*, the back-bone must be taken out, and fine flowre must be added. Thus these *Trochusks* being made, they must be dryed in the shade, apart from the Sun-beams, and being so prepared, they be of very great use for many medicines.

The use of *Triacle* is profitable for many things, for not only by his own nature it availeth against the biting of venomous creatures and poysons, but also it is found by experience, to help many other great infirmities. For it easeth the Gowt and pain in the joynts, it dryeth fluxes, it very much profiteth men molested with the Dropsie, leprous and melancholick persons, those that have *Quartane Agues*, or the Jaundise, those that have a weak voice, or that spet blood: those that are troubled with aking reins, with *Dysentery*, with the stone, with short breath, with passion of the liver or milt, with choler, with heart-ach, with the Falling-sicknesse. It driveth all kinde of Worms out of the bowels. It is the most soveraign remedy of the Plague.

Even to them that are in health the often use of it is wholesome, for it promiseth long life, and firm health, it consumeth excrements, it strengtheneth natural actions, it quickeneth the wit, and sharpeneth all the senses; it preserveth the body from poyson and other offences, and maketh it scarce subject to danger by such casualties; it begetteth good blood, it corrupteth the the air, and waters; neither alone doth it deliver from instant diseases, but also preserveth from those that be imminent.

OF EARTH-WORMS.

Doctor Bon-
hams discourse
of Worms.

Although there be many and sundry sorts of Worms which do contain in them some poysonous quality, yet for all that, at this time my purpose is to discourse especially of Earth-worms, whereof some are bred only in the earth, and others among plants, and in the bodies of living creatures. Worms of the earth are termed by *Plautus* and *Columella* *Lumbrici*, peradventure as being derived a *Lubricitate*. They are called also *Terræ Intestina* of the *Latines*, as well because they take their first beginning and breeding in the very bowels and inward parts of the Earth, as because being pressed and squeezed betwixt the fingers or otherwise, they do void forth excrements after the fashion of living beasts that have intrails in them. The *Greeks* call them *Ges enterā*; *Hesychius* calleth them *Embullos*; *Brunfelsius* *Otho* in his *Physick Lexicon* writeth, that they are usually called in the *Cilician* tongue *Gaphagas*, fetching the derivation of the word *parā Tō gāian phāgein*, for they feed upon earth. Of the *Englishmen* they are called *Meds*, and *Earth-worms*; of the *French*, *Vers de Terra*; of the *German*, *Eert wurm*, and *Erdwurmem*, *Melet*, *Ode Regenwurm*; of the *Belgians*, *Pier-wurm*, or *Rengenwurm*; of the *Italians*, *Lumbrichi*; of the *Spaniards*, *Lumbrizes*; of the *Polonians*, *Glissi*; of the *Hungarians*, *Galizsa*; of the *Arabians* they are called *Charatin*. *Manardus* in his second Book and 40. Epistle writeth, that in times past they were called *Onisculi*, and *Nisculi*.

There are found especially two sorts of Earth-worms, which are either greater or lesser. The greater Earth-worms are somewhat long, almost like in proportion and shape to those round Worms which do breed in mens bodies. They are half a foot long at least, and being stretched out in length they are found to be a foot long, they are of a whitish colour, and sometimes though seldom of a bloody hue: and for the most part they are all adorned with a chain about their necks, or rather they seem to wear a certain collar, wherein there is a little blood contained, and they lack eyes and eye-sight, as all sorts of Worms do.

They breed of the slime of the earth, taking their first being from putrefaction, and of the fat moisture of the same earth they are again fed and nourished, and into earth at last are resolved. When there falleth any showre of rain, then this kinde of Worm creepeth suddenly out of the earth, whereupon old *Euclio* in *Plautus* being very careful of his pot of Gold, speaketh aptly to his Drudge *Strobilus* in these words;

*Foras, foras Lumbrice, qui sub terra crepsisti modo,
Qui modo nusquam camparebas, nunc autem cum compares, peris.*

In Anularia.

Which may be Englished thus;

*Away, away thou Worm, late from the earth crept out,
Safe thou wast unseen, but seen, life fails I doubt.*

Here *Euclio* very properly termeth his Bondman *Strobilus*, a Worm, because not being espyed of his Master before, he suddenly came sneaking out from behind an Altar where he was hid, much like a Worm, that in moist weather issueth out of the ground. Those little heaps which are cast up and lie shining and wrinkled before the mouth or edges of their holes, I take them to be their miery excrements: for I could never as yet finde other excrementitious substance, droffy matter, or other feculency, but only bare earth in them, whose alimentary juyce and moisture being clean exhausted, they cast out the remainder, as an unprofitable burthen, nothing fit for nourishment. At the entrance of their doors, which yet steadeth them to some commodious use, for stopping and damming up their holes that the rain cannot so easily soke in, they are by these means safely defended from many annoyances and dangers, that otherwise might light upon them.

Their delight is to couple together, especially in a rainy night, cleaving together untill the morning: and in the same they are not folded round about one another like unto Serpents, but are straightly closed together side-wise, and thus do they remain sticking close the one to the other. They send forth a certain froathy slime or jelly when that they joyn together. They do ever keep the middle part of their body within the earth, I mean their hinder-parts; yea even in their mutual joyning together, neither are they at any time so fast glewed and closed, but with the least stirring and motion of the ground that can be imagined, they are straight-ways severed, withdrawing themselves speedily into their lurking holes. In rainy weather they are whiter a great deal then at other times, unless it be when they couple together, for then they appear very red. I my self about the midst of *April*, did once open a thick female Worm, and within the flesh I found a certain receptacle ringed round about, and filling up the whole cavity of the body, having a thin membrane or seat enclosing it, and in this aforesaid store-house the earth which she had fed on, and wherewith she was sustained, was held and contained. Her egges were found to be in a safe place above the receptacle, next to the mouth, there were many of them on a heap together, being all of a whitish colour.

The lesser Earth-worms for perspicuities sake, we with *Georgius Agricola* will name *Ascarides*: and these are often found in great numbers in Dung-hills, Mixens, and under heaps of stones. Of this sort some are red, (which we *Englishmen* call *Dogs*) and these be they that *Anglers* and *Fishers* do

do so much desire, for Fishes will greedily devour them, and for that end they with them do bait their hooks.

There be some others of these lesser Earth-worms that are somewhat of a blew colour, other some again are yellow only about the tail : whereupon they have purchased the name of Yellow-tails. Some again are ringed about the necks, withall very fat. Some others there be that have neither chains nor rings, and these commonly be more lank and slender of body then the former, and these I judge to be the males. These Worms do specially breed in Autumn, or at the fall of the leaf, by reason then there is but little moisture in the earth, and this is *Aristotles* opinion. Both kindes do live long in the water, but yet at length for want of sustenance there they die. They move from place to place with a kinde of reaching and thrusting forwards, for we cannot properly say that they do either rowl or tumble. *Olympio* in *Plautus* would go about to make a simple plain fellow believe that Worms did eat nothing but very earth, because he used these words to *Chalinus*;

Post autem nisi nisi ruri tu ervum comederis :
(for thus *Lambine* readeth)

Aut quasi Lumbricus terram.

In English thus;

*And afterward thou nought but Tares shalt eat,
Or else like Worms, the earth shall be thy meat.*

But by earth here in this place, he understandeth not pure earth, and such as is without any other mixture, but rather the fat, juyce, and moisture of the same. And this is the reason, that Earth-worms are not to be found in all soils alike, as in barren, sandy, stony, hard, and bare grounds, but only in fat, gravelly, moist, clammy and fertile. And for this respect *England* hath many Worms, because both Countrey and soil are very moist : and this moisture whereon they feed must not be salt, sowre, tart, or bitter, but sweet and toothsome : and therefore it is, that *Lucretius* in his second Book writeth, that Worms are bred most when it showreth, as in rainy seasons and moist weather.

*Quatenus in pullos animaleis vertier ova
Cerninus alinum, vermesq; effervere terras
Intempestivos cum putror coepit ob imbres.*

In English thus;

*Even as in time of rain, we see
Birds Egges their young forth hatch,
And Worms in heat of gendering be
When they clouds rot do catch.*

In *Theriaca*.

And to this opinion of *Lucretius*, *Nicander* seemeth to lean, when he affirmeth, that these Worms are nourished altogether of the earth that is moistened with long rain, or with some smoaking shower : for making a difference between the Serpent *Scytale*, and the *Amphisbena*, he thus writeth;

*Steiletes pachetos, tes elminthos pelei ogros
He cai entera ges eia trephei ombrimos aia. Id est.
Manubrii ligonis latitudo, longitudo vero ei que Lumbrico,
Aut terre intestinis, que imbris irrigata terra alit.*

That is to say;

*As broad as hafi of Spade, his length like little Worm,
And fed with dreary earth, moist by clouds and rainy form.*

The greater sort of Earth-worms live in the bowels of the earth, and most of all in an open free air, and where there is some repair and confluence of people. Every morning they withdraw themselves into their secret holes and corners within the ground, fencing the entrance of them with their excrements they have voided forth, in a fair and Sunshine weather : but in rainy weather they use to stop the mouths of their holes with some stalk or leaves of herbs or trees, being drawn a little inwardly into the earth. They feed upon the roots of those Plants which have any sweet juyce or moisture in them ; and therefore one may many times finde them amongst the roots of common Meddow-grasse : and they do live for the most part by the fat moisture of the earth, yet will they also greedily devour crums of white Bread unleavened, as I have often seen. In the Spring time, they first appear to come forth from the bowels of the earth, and all the Winter they lie hid in the ground, but yet if it be a very sharp and pinching cold Winter, and a dry Summer follow, for lack of moisture they do almost all die.

Besides, if you dig into the earth, or make a great motion, trampling, or hard treading upon the same, pouring in any strange liquor or moisture into the same, wherewithall they are unacquainted ; as for example, the juyce of Wall-nut-trees, the water wherein Hemp either seeds or leaves are

are soaked, or been laid to rot in common lye, and the like, they will issue out of the earth speedily, and by this means Fisher-men and Anglers do take them.

In like manner, they cannot endure Salt, or aromatical things, nor by their good will come neer them, for but touching any of these they will draw themselves on a heap, and so die. Worms are found to be very venomous in the Kingdom of *Mogor*, and the Inhabitants there do stand in so great fear of them, that they be destroyed and slain by them when they travel any journey; and therefore there they use ordinarily to carry Beesoms with them to sweep the plain ways for fear of further hurt. *Georgius Agricola* saith, that the little Worms called *Ascarides*, are not all of one colour: for some are white, some yellow (as I remembred a little before) and others again are very black: and many of these in tilling the earth are cast up by the plough, and many found in divers places all on a heap together. These be they that destroy corn-fields, for by sharing or biting, the roots the fruit dyeth.

Some say, that those Worms do most mischief to corn-grounds, which in some places of *Italy* the people term *Zaccarole*, and these are thick, almost a finger long, being naturally of a very cold constitution of body; and therefore they never use to come forth of the earth, but when the weather is passing hot, for then will they come forth, even to the surface of the ground, as it is notably set down, by the famous Poet *Homer*:

— à quo ceu fonte perenni,
Vatum Pietis labra rigantur aquis.

In English thus;

By whom, as by an everlasting filling Spring,
With Muses liquor, Poets lips are bath'd to sing.

Ovi. amo. l. 3.

Homer very fitly compareth *Harpalion* when he fell down dead amongst his companions, to a silly Worm, when as seeking to escape by flight out of the battel, he was wounded to death by *Meriones*, shooting an arrow or steel dart into his hanch or hip, his verses be these;

Meriones d' apiontos iei chalkere oiston,
Kai r'ebale gloucon kata dexion autar oistos,
Antikron kata kustin up' osteon exeperefen:
Ezomenos de cat' authi philon en chersin etairon,
Thumon apopneion, oste scolex epi gaia
Keito tacheis ecd' aimo melan ree, deue de gaian. *Id est.*
Meriones autem in abeuntem misit aream sagittam,
Et vulneravit coxam ad dextram, ac sagitta
E regione per vesicam sub os penetravit:
Residens autem illic charorum inter manus sociorum
Animam efflans, tanquam vermis super terram
Jacebat extensus: sanguisq; effluebat, tingebat autem terram.

That is to say;

But as he went away, behold *Meriones*
With brazen dart, did his right hip-bone wound,
Which neer the bladder did the bone through pierce:
In friends deer hands, he dyed upon the ground.
So stretcht upon the earth as Worm he lyed,
Black bloud out flowing, the same bedyed.

Mark well the slenderesse of this comparison, whereby he would give us to understand the base estate, and faint heart of *Harpalion*. For in other places having to write of noble, valiant, and magnanimous persons, when they were ready to give up the ghost, he useth the words *Sphadazein*, *Bruchein*, and the like to these, secretly insinuating to us, that they fell not down dead like impotent Cowards, or timorous abjects, but that they raged like Lions, with grinding and gnashing their teeth together, that they were blasted, benumbed, or suddenly deprived of all their lives and senses, &c. But here this pusillanimous and sordidous minded man *Harpalion*, seemed to be disgraced by his resembling to a poor Worm, being peradventure a man of so small estimation, and vile condition, as that no greater comparison seemed to fit him. It seemeth he was a man but of a faint courage, and very weak withall, because striking and thrusting with his Spear or Javellin at the Shield or Target of *Atrides*, he was not able to strike it through. But although this famous Poet doth so much seem to extenuate and debase a weak Worm: yet others have left us in their writings such commendations of their singular use and necessity, for the recovery of mans health (then which no earthly thing is more pretious) and have so nobilitated the worth of these poor contemptible Creatures, as I think, nature as yet hath scarce given any other simple Medicine, or experience found out by tract of time, nor knowledge of plants by long study hath revealed; nor *Paracelsus* by the Distillations of his Limbeck hath made known to the world, any secret endued with so many vertues and excellent properties against so many diseases: and for proof hereof, it shall not be beside the purpose to examine and describe the rarest and most probable that are recorded amongst the learned.

Earth-

Earth-worms do mollifie, conglutinate, appease pain, and by their terrestrial, and withall waterish humidity they do contemper any affected part, orderly and measurably moderating any excesse whatsoever. The powder of Worms is thus prepared: They use to take the greatest Earth-worm that can be found, and to wrap them in Mosse, suffering them there to remain for a certain time, thereby the better to purge and cleanse them from that clammy and filthy slimynesse, which outwardly cleaveth to their bodies. When all this is done, they presse hard the hinder-part of their bodies neer to the tail, squeezing out thereby their excrements, that no impurity so neer as is possible may be retained in them.

Thirdly, they use to put them into a pot, or some fit vessel with some white Wine, and a little salt, and straining them gently between the fingers, they first of all cast away that Wine, and then do they pour more Wine to them, and after the washing of the Worms, they must also take away some of the Wine, for it must not all be poured away (as some would have it) and this must so often be done and renewed until the Wine be passing clear without any filth or drossinesse, for by this way their slimy jelly, and glutinous evil quality is clear lost and spent. Being thus prepared, they are to be dried by little and little in an Oven, so long till they may be brought to powder, which being beaten and searfed, it is to be kept in a Glasse vessel far from the fire by it self. A dram of this powder being commixed with the juyce of Marigolds, cureth the Epilepsie, with some sweet Wine, as *Muscadel*, *Baltard*, or the *Metheglin* of the *Welchmen*. It helpeth the *Dropsie*. With white Wine and *Myrrhe*, the *Jaundise*, with new Wine, or *Hydromel* the *Stone*; *Ulcers* of the *Reins* and *Bladder*: It stayeth also the loosnesse of the belly, helpeth barrennesse, and expelleth the *Secondine*, it asswageth the pain of the hanch or hip; by some the *Sciatica*; it openeth obstructions of the *Liver*, driveth away *Tertian Agues*, and expelleth all Worms that are bred in the *Guts*, being given and taken with the decoction or distilled Water of *Germander*, *Worm-wood*, *Southern-wood*, *Garlick*, *Scordum*, *Centory*, and such like.

The decoction of Worms made with the juyce of *Knot-grasse*, or *Comfery*, *Salomons Seal*, or *Sarasius* compound, cureth the disease tearmed by Physitians *Diabetes*, when one cannot hold his water, but that it runneth from him without stay, or as fast as he drinketh. A Glyster likewise made of the decoction of Earth-worms, and also taken accordingly, doth marvellously assuage and appease the pain of the *Hemorrhoids*. There be some that give the decoction of Earth-worms to those persons that have any congealed or clotted blood in their bodies, and that with happy successe. The vertue of Earth-worms is exceedingly set forth, both by the *Grecians* and *Arabians*, to encrease Milk in womens breasts.

Hieronymus Mercurialis a learned Physitian of *Italy*, adviseth Nurses to use this confection following in case they want milk, always provided that there be not a *Fever* joyned withall. Take of the *Kernels* of the fruit of the *Pine-tree*, sweet *Almonds*, of each alike, one ounce, seeds of *Fennel*, *Parsley*, and *Rapes*, of either alike one dram, of the powder of Earth-worms washed in Wine, two drams; with *Sugar* so much as is sufficient, to be given the quantity of a dram or two in the morning, and after it drink some small Wine, or *Capon-broth* boyled with *Rape-seeds* and *Leeks*. Against the *Tooth-ach* the same powder of Earth-worms is proved singular, being decocted in *Oyl*, and dropped a little at once into the ear, on the same side the pain is, as *Pliny* witnesseth, or a little of it put into the contrary ear, will perform the same effect, as *Dioscorides* testifieth. And thus far of Earth-worms taken into the body, and of their manifold vertues, according to the evidence and testimony of *Dioscorides*, *Galen*, *Aetius*, *Paulus*, *Aegineta*, *Myrepsus*, *Pliny*, and daily experience which goeth beyond the precepts of all skilful Masters: for this is the Schoolmistris of all Arts, as *Manilius* in his second Book hath written;

*Per varios usus artem experientia fecit,
Exemplo monstrante viam.*

In English thus;

*Experience teacheth art by use of things,
When as example plainest way forth brings.*

Being also beaten to powder, and outwardly applyed, they do close and solder up wounds, and conglutinate sinews that are cut, and consolidating them again in the space of seven days, and to perform this cure the better, *Democritus* adviseth to keep them in *Honey*. The ashes of Earth-worms duly prepared, cleanseth *Sordious*, stinking and rotten *Ulcers*, consuming and wasting away their hard lips, or callous edges, if it be tempered with *Tar* and *Simblian Honey*, as *Pliny* affirmeth. *Dioscorides* saith, that the *Honey* of *Sicilia* was taken for that of *Simblia* in his time. Their ashes likewise draweth our *Darts* or *Arrows* shot into the body, or any other matter that sticketh in the flesh, if they be tempered with *Oil of Roses*, and so applyed to the place affected. The powder also cureth *Kibes* in the heels, and *Chilblanes* on the hands, as *Marcellus* testifieth, for hurts that happen to the sinews when they are cut in pieces, *Quintus Serenus* hath these verses;

*Profuert terra Lumbricos indere tritos,
Queis vetus & ranceus sociari axungia debet.*

It is good (saith he) to apply to sinews that are dissected. The powder of Earth-worms mixed and wrought up with old, rammish, and unfavory Barrows grease, to be put into the grief. *Marcellus Empiricus*, Besides the powder of Earth-worms and Axunger, addeth further, Grounswell, and the tender tops of the Box-tree with *Olibanum*: all these being made up and tempered together to make an Emplaster, he counselleth to be applyed to sinews that are laid open, cut asunder, or that have received any puncture, or suffer any pain or aking whatsoever. *Pliny* saith, that there cannot be a better medicine found out for broken bones, then Earth-worms and field Mice dried and pulverised, and so mixed together with Oyl of Roses, to be laid in the form of an emplaster upon the part fractured. Yea, to assuage and appease pain, both in the joynts and in the sinews of Horses, there hath not been found out a more notable Medicine, as we may well perceive by the writings both of *Russius*, *Absyrus*, and *Didymus*: whereupon *Cardan* hath observed, that all pains whatsoever may be mitigated by their apt using. *Carolus Clusius* saith, that the *Indians* do make an excellent unguent of Earth-worms against the disease called *Erysipelas*, being a swelling full of heat and rednesse with pain round about, commonly called *S. Antonies fire*: And thus it is prepared:

They first take Earth-worms alive, feeding them either with the leaves of *Mæza*, or else with fine Meal, until by this means they grow fat, afterwards boiling them in an earthen vessel, (remembering ever to scum the same) they do strain them, boyling them yet again, to the consistence almost of an emplaster, which if it be rightly prepared is of a yellow colour. And this Medicine may well be used for any burning or scalding. My purpose is not to vouch all those authorities I might, concerning the admirable Nature and vertue of Earth-worms: for so I think I might alledge six hundred more, which is not meet to be inserted in this place. I will therefore now passe to their qualities and medicinal uses for irrational creatures.

Pelagonius much commendeth Earth-worms as an excellent medicine for the Bots or Worms that are in Horses, and in the bodies of Oxen and Kine, affirming that the best way is to put them alive into their Nostrils, although without question it were far better to convey them into their maws by the means of some horn. *Tardius* adviseth to give the powder of Earth-worms with some hot flesh, to Hawks when they cannot exonerate nature (or how Faulkeners tearm it, I know not.) For that (saith he) will loosen their bellies. Moles do also feed full favorly upon them, and if they fall a digging, it is strange to see with what sudden hast and speed then poor Worms will issue out of the ground. In like sort Hogs and Swine (as *Varro* writeth) by their turning up the mud, and rooting in the earth with their snouts, do by this means dig up the Worms, that they may eat them.

Albertus Magnus saith, that Toads do feed upon Worms. *Belonius* saith, that Lizards and *Tarentinus*, that the Sea-fish called *Gryff*, or *Grample*, doth greedily devour them, and finally experience it self witnesseth, that Frogs, Eels, Gudgeons, Carps, Breams, Roches, and Trowts, do satisfie their hungry guts by feeding upon them. *Aristotle* in his eight Book *De Nat. Animal. Cap. 3.* describeth a certain Bird that liveth in the waters, which *Gaza* interpreteth *Capella*, though the Philosopher calleth it *Aix*, and some have called it *Udhellus*, that liveth for the most part upon Worms: yea, Thrushes, Robin-red-breasts, Mun-murderers, and Bramblings, Hens, Chaffinches, Gnat-snap-pers, Bull-finches, and all sorts of Crows will feed upon them; and therefore it is that there be more Crows in *England*, then in any other Countrey in the world, respecting the greatnesse, because here the soil being moist and fat, there is abundance of Earth-worms serving for their food, as *Polydorus Virgilius* in his first Book of the History of *England*, (which he dedicated to King *Henry* the eight) hath excellently delivered.

The people of *India*, if we will credit *Mmardus*, do make of these Worms divers juncats, as we do Tarts, Marchpanes, Wafers, and Cheese-cakes, to eat instead of other dainties. And the Inhabitants of *West-India* do devour them raw, as *Francis Lopez* testifieth. The people of *Europe* in no place that ever I heard or read of, can endure them to be set on their Tables, but for medicinal uses only they desire them. *Plautus* useth in stead of a proverb this that followeth;

Nuno ab transfenna hic turdus Lambricum petit.

In Bacchide.

It is an allegory taken and borrowed from a gin or snare wherewith Birds are taken: by which *Chrysalus* the bond-man bringing certain Letters to *Nicobolus* an old man, signifieth and giveth warning, that the weak old man was by the reading of the letter no otherwise ensnared, intangled, and deceived, then some Birds are taken by subtile and crafty sleights. For *Transfenna* is nothing but a deceitful cord stretched out to take Birds, especially Thrushes or Mavisses withall, and Worms is their proper food, which while they endeavour to entrap, they themselves are deceived and taken. Surely I should not think that those Fishers and Anglers be very wise, who to take Worms, use to pour lye or water into the earth wherein Hemp, Southern-wood, Centory, Worm-wood, or Vervin have been long soaked, or any other strange moisture, causing them by this mean to issue forth out of the earth, for the Earth-worms by this kinde of dealing being made more bitter, unfavoury, and unpleasant, no fishes will once touch or tast them, but rather seek to avoid them. But contrarywise, if they will let them lie a whole day in Wheat-meal, putting a little Honey to it, and then bait their hooks with them, they will be so sweet, pleasant, and delectable, as that the unwary Fish will sooner bite at it, then at *Ambrosia*, the very meat of the Gods.

Earth-

Earth-worms do also much good to men, serving them to great use in that they do prognosticate and foretell rainy weather by their sodain breaking or issuing forth of the ground : and if none appear above ground over-night, it is a great signit will be calm and fair weather the next day. The ancient people of the world have ever observed this as a general rule, that if Worms pierce through the earth violently, and in haste by heaps, as if they had bored it through with some little Auger or Piercer, they took it for an infallible token of Rain shortly after to fall. For the Earth being as it were imbrued, distained, made moist, and moved with an imperceptible motion, partly the South winde, and partly also a vaporous air, it yeeldeth an easie passage for round Worms to winde out of the inward places of the Earth, to give unto them moist food, and to minister store of fat juyces, or fattish jelly, wherewith they are altogether delighted.

Some there be found, that will fashion and frame Iron after such a manner, as that they will bring it to the hardnesse of any steel, after this order following. They take of Earth-worms two parts, of Raddish roots one part, after they are bruised together, the water is put into a Limbeck to be distilled, or else take of the distilled water of Worms *l. iij.* of the juyce of Raddish *l. i.* mix them together, for Iron being often quenched in this water, will grow exceeding hard.

Another. Take of Earth-worms *l. ij.* distil them in a Limbeck with an easie and gentle fire, and temper your Iron in this distilled water. Another. Take of Goats blood so much as you please, adding to it a little common salt, then bury them in the earth in a pot well glased and luted for thirty days together. Then distil after this the same blood in *Balneo*, and to this distilled liquor, add so much of the distilled water of Earth-worms. Another. Take of Earth-worms, of the roots of Apple-trees, of Rapes, of each a like-much, distil them apart by by themselves, and in equal portions of this water so distilled, and afterwards equally mixed, quench your Iron in it, as is said before. *Antonyus Galus.*

It shall not be impertinent to our matter we handle, to add a word or two concerning those worms that are found and do breed in the snow, which *Theophanes* in *Strabo* calleth *Oripas* : but because it may seem very strange and incredible, to think that any worms breed and live only in the Snow, you shall hear what the Ancients have committed to writing, and especially *Strabo* his opinion concerning this point. It is (saith he) received amongst the greater number of men, that in the snow there are certain clots or hard lumps that are very hollow, which waxing hard and thick, do contain the best water as it were in a certain coat; and that in this case or purse there do breed worms. *Theophanes* calleth them *Oripas*, and *Apollonides*, *Vermes*.

Aristotle saith, that living creatures will breed also even in those things that are not subject to putrefaction; as for example, in the fire and snow, which of all things in the world, one would take never to be apt to putrefie, and yet in old Snow Worms will be bred. Old Snow that hath lyen long, will look somewhat dun, or of a dullish white colour, and therefore the Snow-worms are of the same hiew, and likewise rough and hairy. But those Snow-worms which are found to breed when the air is somewhat warm, are great, and white in colour, and all these Snow-worms will hardly stir, or move from place to place. And *Pliny* is of the same judgement, and the Author of that Book which is intituled *De Plantis*, falsely fathered upon *Aristotle*.

Lib II. c. 35.

Yet some there be that denying all these authorities, and rejecting whatsoever can be objected for confirmation thereof to the contrary, do stoutly maintain by divers reasons, that creatures cannot breed in the Snow : because that in Snow there is no heat, and where no quickning heat is, there can be no production of any living thing. Again, *Aristotle* writeth that nothing will come of Ice, because it is (as he saith) most cold : and hereupon they infer that in all reason, nothing likewise can take his beginning from Snow; neither is it credible, that husbandmen would so often wish for Snow in Winter to destroy and consume Worms, and other little Vermine, that else would prove so hurtful to their corn and other fruits of the earth. And if any Worms be found in the Snow, it followeth not straightways that therein they first receive their beginning, but rather that they first come out of the earth, and are afterwards seen to be wrapped up, and lie on heaps in the Snow.

But by their leaves these reasons are very weak, and may readily be answered thus; that whereas they maintain that nothing can breed in the Snow, because it is void of any heat at all, herein they build upon a false ground. For if we will adhibit credit to *Averrhoes*, there is nothing compounded and made of the three Elements, that is absolutely without heat. And *Aristotle* in his fifth Book *De Generatione Animalium*, telleth us precisely, that there is no moisture without heat. His words are *Ouden hugron aneu thermou*. Now Snow is a compact, and fast congealed substance, and somewhat moist, for although it proceedeth by congelation, which is nothing else but a kinde of exsiccation, yet notwithstanding, the matter whereof it first cometh is a vapour, whose nature is moist, and with little ado may be turned into water.

I must needs say that congelation is a kinde of exsiccation, but yet not simply: for exsiccation is, when as humidity goeth away, it putteth forth any matter, but in Snow there is no humidity that is drawn out, but it is rather wrapped in and inclosed more strongly, and as it were, bounded round. Furthermore *Aristotle* in his first Book of his *Meteors* saith, that Snow is *Nubes congelata*, a clowd congealed or thicked together, and that in Snow there is much heat. And in his fifth Book *De Generatione Animalium*, he further addeth, that the whitenesse of the Snow is caused by the air, that the air is hot and moist, and the Snow is white; whereupon we conclude, that Snow

Snow is not so cold, as some would bear us in hand. I well hold that nothing will take his Original from Ice, in regard of his excessive coldness, but yet snow is nothing nigh so cold as that. So then all the hinderance and let. is found to exceed of cold, which is nothing so effectual or forcible as in Ice, and the cold being proved to be far lesser, there can nothing be alleadged to the contrary, but that it may putrefie.

Now in that Snow is such an enemy to Worms, and many other small creatures, as that for the most part it destroyeth them, yet it followeth not, that the reason of *Aristotle* is quite overthrown: because (as we daily see) that those creatures which live in the air, will for the most part be suffocate and die in the water; and contrariwise, those that live in the water, cannot endure the air. Yet hereupon it followeth not, that if they be choked in the water, that none at all will live in the water, and the same reason is to be alleadged concerning the air. Therefore it is no marvail if those Worms that first breed in the earth, and live in the earth, be killed by the Snow; yet it necessarily followeth not, that no living creature can take his first being either from or in the snow. But if it can, as *Aristotle* witnesseth, it is so far unlikely that the same Snow should be the destroyer of that it first was bred of, as I think rather it cannot live separately, but of necessity in the same Snow; no otherwise then fishes can live without water, from which they first sprung and had their beginning.

And to this opinion leaneth *Theophrastus*, in his first Book *De Causis Plantarum*, whose words be these, *Apania gar pha n tai ta zoa, kai ta phuta kai diamenonta, kai genomena, en tois oikeiois topois*: For all creatures (saith he) whatsoever seem, both plants to remain, and to be generated and bred, in their own due and proper places. And after this he addeth and urgeth a little further, *Aparthe men hupo touton*; from his own home and special particular place of abode, nothing can suffer, sustain harm, or be corrupted. And in his fifth Book *De caus. Plan.* he setteth it down more perspicuously, how that Worms which are bred in some special trees, being afterward translated and changed to other trees, where they never came before, cannot possibly live. Wherefore it is more consonant to reason, and more agreeable to common sense, to affirm that those Worms which are found folded and rolled up in the Snow, to have been first bred in the same Snow, rather then to have issued out of the earth.

Neither are we to make any question or scruple concerning their food; for there is no doubt, but the mother from whence they proceeded, will provide sufficient nourishment for her own children. For as we said a little before, the Snow is no simple thing, but compacted and concrete together of many, and of this nature ought every aliment to be. *Julius Caesar Scaliger* is of this minde, that Worms are ingendered and brought forth in the very Snow, because there is in it much air and spirit, which afterwards being heated and brought to some warmth together, may cause them to generate; for it is the nature and quality of Snow to make fat the earth, of which fattish moisture or Jelly, there may (heat being joyned) be produced a living creature.

There be some that do constantly hold, that in the midst of certain stones, of which they use to make Lime, there do breed divers creatures, of very different kindes, and sundry proportions and shapes, and likewise Worms, with hairy backs, and many feet, which are wont to do much hurt to Furnaces and Limbeckills where they make Lyme. Yet *Casparinus* in his first Book *De Metal.* chap. 2. thinketh the contrary, assuring us that in Metal-mines, Quarries of Marble, and other stones, there can never any living body be found. And yet in Rocks of the Sea, within the hollow places and rifts of the stones, they do commonly finde certain small living things called *Dactili*.

I do not doubt, whatsoever he saith to the contrary, but that many creeping, and other living creatures, may be found both in the secret Mines of stone, and sometimes also amongst Metals, although it be seldom seen. And for confirmation hereof, I will alleadge one example happening not many years since in our own Countrey. At *Harlestone* a mile from *Holdenby* in *Northamptonshire*, there was a Quarry of free stone found out, of which they digged for the building of *Sir Christopher Hattons* house, where there was taken up one being a yard and a half square every way at the least, and being cloven asunder, there was found in the very midst of it a great Toad alive, but within a very short space after, comming to the open air, it dyed. This stone amongst others, was taken very deep out of the earth, it was split and cut asunder by one whose name is *Lole*, an old man yet living at this day, it was seen of five hundred persons, Gentlemen and others, of worthy repute and esteem, the most part of them living at this hour, whose attestation may defend me in this report: and surely if Toads may live in the midst of stones, I can see no reason but that Worms may there be found, but as yet I could never see it.

In the year of Grace 970. at what time *Romualdus* the son of *Sergius* a young Monk, was advanced by the Nobility of *Ravenna* to be their Archbishop, there followed a great death and murrain among Earth-worms: after that again ensued scarfity and death of all fruits of the earth, as *Carolus Sigonius* in his Chronicle of the Kingdom of *Italy* declareth. *Henry* Emperor of *Rome*, the son of the Emperour *Henry* the third, as *Crantzius* hath written, when he took his voyage into *Italy*, being suddenly stayed of his intended course, with an Army sent against him by *Matild*, that he should passe no further then *Lombardy*, yet having taken *Mutina*,

there appeared a strange and uncouth sign in the air, for an innumerable company of Worms, smaller and thinner then any Flies, did flie about in the air, being so thick that they might be touched with any small stick or wand, and sometimes with the hand, so that they covered the face of the earth one mile in breadth, and darkned likewise the air two or three miles in length. Some did interpret it as a sign or fore-telling, that some Christian Prince should go into the Holy-land.

In the year of our Lord God one thousand one hundred and four, there were seen divers fiery and flying Worms in the air, in such an infinite multitude, that they darkened the light of the Sun, seeming to deprive mens eye-sight thereof, and shortly after this monstrous and unnatural wonder, there followed other strange and seldom-seen prodigious sights on the earth: and what a boisterous storm of troubles, and raging whirl-winde of War and bloud-shed shortly after ensued, the event thereof did plainly manifest.

FINIS.

A Physical Index, containing plentiful Remedies for all Diseases incident to the Body of Man, drawn from the several Creatures contained in this First Volum.

To the Noble Knight, and the Kings chief Physician, Dr. WILLIAM PADDY:
Theodore Mayerne, Knight, Baron of St. Albons, and Companion to the
chief Physicians in the Court of Britain, wisheth much health.

Our Countryman *Mouffet*, a notable ornament to the company of Physicians, a man of the more polite and solid learning, and well experienced in most Sciences, had formerly entituled this work of Insects to the ever famous *Elizabeth*, (who was wise above her Sex, valiant, born to reign well, and ruled so many years by the Votes of her Subjects, and by her own undertakings and actions, that were so successful that they were envied at) it was begun by others, but augmented by him, polished, and as it now comes forth exactly perfected, and he thought it no indignity to Dedicate to the greatest Princess the miracles of Nature, which are most conspicuous in the smallest things, which testify the infinite power of the supreme Creator of all things, and raise the mindes of Princes who are the children of the most Highest, to the cause of all causes, that they may in all places acknowledge the presence of the Deity, and his bountiful hand in his singular direction in respect of them, and his influence that acts by election, and may adore him with an humble, as with a grateful minde; so weighing by reason the degrees of proportion, that he is most obliged who hath received most. The Author before he could accomplish this purpose, died; he was worthy to have lived longer for the advantage of Art and Learning. Thus the Book was left after his death to his Heir, who had a smaller estate than suited with the name of his Father, or his merit required, and his many watchings and labours sustained for the publick good, in curing of the sick, justly deserved. Fortune is blinde and will hardly favour those that are the best but against her will, as if it were disagreeing and dissonant that there should be any commerce between *Pluto* with *Apollo*, *Minerva* and *Mercury*. *Elizabeth* being departed this life, and *James* then holding the reins of the *British* Empire piously and justly, and ruling peaceably amongst the storms that at that time shook all *Europe*, having weeded out by his Majestick Scepter, and by the providence of his soul which was prudent even to miracle, all Monsters, which endeavoured to shake the foundations of the Kingdome by Treason, Deceit, Wickedness, Lust, and Wrath. The Overseers of this Orphan left in a very poor condition, were resolved to Dedicate this learned Work to this Noble Heros, who was no less famous for his Learning than for a concurrence of all Virtues that met in him: but great poverty at home, delayed the business, and hindred this windy intention from taking effect, and the off-spring from coming to the light. So the Book lay for a long time in obscurity under the custody of the friends of the Author departed, until such time as it was offered to me by *Darnellus*, who was formerly his Apothecary, and a very honest man, who wished well to his Master being dead, and was very desirous of his glory; so it lay for some years in my Study cast aside in the dust among Worms and Moths; truly it was no fault of mine, but of the Printers who were so greedy of Money, that though in many Countreys I invited them by my Letters, and did solicit them to receive the Orphan, yet they refused (as they said) to take upon them an unthankful business; they were not pleased with the benefit of a noble Art, unless it would pay more than the freight. O the times wherein the pains of learned men are valued at the price the work will be sold for, and the money that must be laid out for ink and paper, or by the depraved opinion of the vulgar (who commonly applaud what is worst) and not by the essence of the thing it self, or dignity of the subject, or the solid explanation of the same! Then there was an Epistle prefixed to the beginning which men call Dedicatory, which being it was to carry the name before it of one of the foresaid Princes, the Edition seemed to come forth unseasonably after they were both dead. Perchance some other man would have caught at this occasion, to have brought it to King *Charles*, the great Son of a great Father,

The Epistle Dedicatory.

ther, under whose fortunate reign in his Kingly person, all Kingly virtues run together in troops, each striving to have the upper hand) and kneeling down before his Majesty, would have offered unto him, in hopes of a reward, another mans Works vail'd with a false cover of commendations, or obscured with the great smoke of courtly eloquence. But I have no such genius, for though I have not lived hitherto unwelcome to Princes, yet I have learned by long practise, that we must use their favour soberly, and never to abuse their ears or eyes, and though you do know easie entrance and fit times to come into their presence, yet importunity is alwaies unseasonable, and especially that which hires mercenary Muses for money to set them forth, which are branded with marks of infamy. Do not think that I detract so much from this Work that I think it not worthy to carry the name of a King in the Frontispice, and might live in publick under the protection of so ambitious an Inscription; but I held it no less than sacriledge to name the childe in stead of another of my own accord, or to bring a deaf person upon the stage, as to what concerns the exposition of the Argument, and with other birds feathers in the very entrance of the work foolishly and vainly to pride my self: yet that the Book might come forth every way complear, and that the Reader who is a lover of the custome may not desire an Epistle, or complain that there is one wanting, according to my manner (wherewith I honour great men with the honour that belongs unto them, but my friend I respect above all, and that continually) I would prefix to this Natural and Physical History the famous name of some man, who by the common consent of the Learned, is well acquainted with both, and who is joyned unto me by no ordinary alliance, who is dear to all good men, and eminent for his own endowments; which office of Reverence and good will may testifie to posterity, in what esteem such men are with me, who are intrinsically furnished with the real tincture of manifold learning, but chiefly with that of the most noble Art of all, which I practise: so I have made choice of thee alone amongst many, that thou mayst be to me in stead of them all, Noble Man, my dearest friend *Paddy*, who art Knighted by the wisest Monarch *James*, who never did any thing vainly, who adornest thy Virtues by thy Titles, and thy Titles by thy Virtues, as our *Thorius* hath written of thee. Thou art he who after the wicked Parricide of Great *Henry*, formerly my most milde Master (which shall for ever convey the said memory of his age to posterity) when I was called by the most Serene *James* from the *French* Court by his own Letters, and by a guide appointed to conduct me into *Britain*, and was immediately honoured with the title of Companion of the chief Physicians, didst not look upon me with bleer and swoln eyes, with the viperous venome of envy; but thou didst entertain me, being a stranger, candidly, and with a cheerful countenance, (as it becomes one of noble Birth) contrary to that of *Horace*, who accuseth the *Britains* divided almost from all the world, of fierceness toward strangers. After that, in the many meetings we had amongst sick people, and in my practise in Physick, when I pleasingly hearkned to the opinions of those that consulted, weighed them, and as it belonged to my place, concluded what was to be done, thou didst hear me without brawling or contradiction, which is the imbred evil custome of some unworthy Physicians; and thou didst very often approve of my opinion, as consonant to reason. In the famous Colledge of *London*, (where as thou wert alwaies most worthy, so thou wert often President) when I was by the votes of the chieftest, and first of all by thy suffrage made a Colleague, according to the Kings Character for my place at Court, thou didst willingly suffer me to have the next place to our President: I farther add, that thou didst never oppose thy self to the many petitions or commendations that were offered by me to our most excellent Colleagues; but thou didst alwaies afford me thy ear to hear me, and thy hands to help me. Lastly thou didst alwaies praise me being absent, and as far as it was in thy power, of thy own accord, from the imbred motion of thy noble minde, thou didst defend my good name privately wounded by the calumnies of envious men, and torn by malice, (which is the condition of good, and of the greatest Princes) by that authority which thou hast amongst thy own Countreymen of what condition soever, and thou wouldst not suffer this scab of backbiting to proceed any farther. O most excellent Man! what shall I repay unto thee, who as a true Philosopher, hast no desire of vain glory, and such things as make a great shew and are vulgarly praised, sought for, and desired by other men, are now esteemed base with thee? My grateful minde, and most full of love towards thee, commands me to offer this small token to thee in testimony

The Epistle Dedicatory.

mony thereof, which accept freely and willingly, and suffer that by this sincere gift, that wicked saying may be disannulled, that men of one profession cannot endure one the other. God the best and the greatest hath granted unto thee long life, by a prosperous aspect of the Stars, for the good of thy Citizens, whose health thou hast preserved and restored by thy care for very many years effectually hitherto, that posterity must justly acknowledge that thou hast lived long, worthy not only of a Garland of oak, but a Statue of gold also, (if our times would afford such honour). Now thou well deserving Captain, discharged by age, thou Champion freed by reason of years with a token of honour, thou conqueror of monsters, that daily spring up with too fruitful an increase for the destruction of mankind, dwellest with thy self, thy soul yet sustaining thy dry body yeelding to wasting time by degrees very easily, which being defiled with no conditions of her prison, sees the Haven, and is almost come into it; thy minde being abstracted from the sad vexations of humane life: and what time thou hast to spare from divine Meditations, penetrating into all Nature, and the secrets of things, thou dost expatiate into the pleasant green Gardens of various natural Philosophy. Behold here is a most exquisite Garland for thee gathered out of the most secret Orchard of our great Parent, which will not only feed the eyes, but will lead the singular acuteness of thy wit, which thou aboundest with, into her most hidden places. Thou being an excellent Anatomist, I beseech thee try if thou canst dissect Insects; the great *Stagyrite* being thy guide, who did not disdain to search into the parts of Animals. Thou shalt finde in the little body of Bees a bottle which is the receptacle of Honey sucked from flowers, and their legs loaded with Bitumen which sticks fast to make wax. Also in the tail there is a horny sting full of revenging poyson, that is ready to draw forth as soon as the Bee please; but the King of the swarm is said to want one, for there naturally belongs to the supreme power, who can overthrow all when he will at his pleasure, and there ought to be an imbred gentleness, whence it is that Kings by their proper attribute are called Fathers and Pastors of the people. In Gnats you shall observe their sounding trumpet that will suck bloud out of Animals, and will draw out moisture through the joynts of the most solid wood, and wine-vessels. How wilt thou be pleased to see the small proboscis of Butterflies wreathed alwaies into a spiral line, after they have drawn forth nutriment from flowers, their extended large wings painted by natures artificial pencil, with paints cannot be imitated; to which the very Rain-bow is scarce comparable;

Which right against the Sun a thousand colours shewes.

What a pleasant spectacle will this be when the artificial hands carefully and curiously guide the most sharp pen-knife, and very fine instrument by direction of the sight! To behold the pipe of the Grasshoppers that live upon dew, and the organs of the shrill sound they make, that in the heat of the Dog-daies importunately beats upon the ears of travellers, which are so framed, that their concave belly is made vaulted under the Diaphragm, over which is extended a cover of a thin and dry membrane, like to a Drum, which lets in the air by an oblique turning, which being beaten by the regular and successive motion of their wings, and stomach coming in at a strait passage, and presently dilated, beating against the rough-cast wals of the hollow place, and refracted, makes a sound. To see the horns of the great Beetles, that are like to Stags horns, and with sharpest points are able to make wounds, and the muscles that move them, and tie them on exceeding fast. The Rhinoceros is of the kinde of great Beetles. The swelling purse which is the matter of the silk, and is wound back again into many turnings, by Silk-worms which are chief of all Caterpillers, of divers forms and colours: in which after the time destinated for the concoction of their food, which is gathered chiefly from Mulberry-leaves, a tenacious glew or jelly is reserved, untill such time as their ventricle swelling, and nature affecting to attain her end, the Worm by degrees belcheth forth her spittle, the thred whereof growing firm by the air (which is provided to make garments for great men) this little creature dispenseth through her very narrow claws, and spinning with the motion of her head and of half her body, with the kembering of it by the help of her forefeet; she first disposeth it for the strengthening of her clew of yarn, and after that upon her own sepulchre where she must receive her transmutation. How the Spider thrusts out her excrements by her lower parts of her body, which is drawn

The Epistle Dedicatory.

forth into a web, of which the poor creature frames nets with great labour, which are necessary to sustain her life; and with her long legs that end in sharp claws, she knits them into knots, being continually obnoxious to repair her work. In the uppermost cases of the green Locusts which feed upon hedges, there are two scales that are hard as horn, the mutual rubbing together whereof by the ministration of the air beaten with their softer wings, make a very sharp sound. The head of all of this kinde is armed, their hinder legs are hard, dry, long, by the vehement thrusting whereof against some firm object, with the help of their most strong tendons, they will cast their body a great way, being equally ballanced, and is heavy enough for the proportion of it, like an arrow coming forth of a bow; as it happens to Fleas that leap with a huge force. But which is yet more, besides their pincers which are as sharp as keen rasors, where is a direct passage from their mouth to their tail; the pylorus is compassed about with toothed bars, that answer one the other with a thorny gomphosis, wherewith they destroy whole fields with devouring fore-teeth, like chizels, and grinde them as it were in a mill, and very suddenly they void it forth again; their hunger never ceases until the vile creatures have consumed whole Countreys which God is angry with, divine revenge commanding them; and brings to nought that people, who ridiculously threaten heaven with destruction. You shall see the sharp spears that arm the mouth of the Spiders Phalangia, and by the small wounds they make, a strange venome enters, and penetrates into the center of the body, and sticks fast to the deepest marrow, lasting so long in the subject that receives it as the cruel beast lives; and is exasperated periodically at certain hours, troubling the phantasie of the persons wounded, which is abated with colours objected like to this Spider; yet it ceaseth not to rage, until musick causeth them to dance, and provokes them to sweat abundantly, whereby the paroxysm is dissolved, which the day following returns at the same hour. You shall behold the internal fire of Glow-worms fastned to their tails, and the torches of the Indian Cocuia that shines in the night, and overcomes Cimmerian darkness. And moreover, if you take lenticular optick Glasses of crystal, (for though you have Lynx his eyes, these are necessary in searching after Atoms) you will admire to see the dark red colour of the Fleas that are curasheers, and their back stiffe with bristles, their legs rough with hair, and between two foreyards there stands a hollow trunk to torture men, which is a bitter plague to maids, and is the greatest enemy to humane rest, especially when that men would sleep. You shall see the eyes of the Lice sticking forth, and their horns, their body crannied all over, their whole substance diaphanous, and through that, the motion of their heart and bloud, as if it floted in *Euripus*. There will appear to thee the flat bodies of the petulant Crab-lice, with their grapples, wherewith they perpetually lance mans skin between the hair with their mouth, and stick on faster than Cockles do to the rocks. Also little Hand-worms which are indivisible they are so small, being with a needle pickt forth of their trenches neer the pools of water which they have made in the skin, and being laid upon ones nail, will discover by the Sun-light their red heads, and feet they creep withall. And if from the inspection of parts you will recal your minde to consider the generation and beginning of Insects, and will weigh the various transmutations which they undergoe, as of Worms into Flies; of Catterpillers (the several species whereof have their original from the corruption of several vegetables) into Chrysallides, (that shine as if leaves of gold were laid upon them) and Butterflies, whose egges again produce an off-spring like Worms, Nature acting successively in a circle, and constantly by a perpetual motion running back into her self: you will doubtless enter upon a large field of Philosophy concerning three Kingdoms of the universal spirit, (the Vegetable, Animal, and Mineral) equally penetrating, replenishing, and governing, and upon the power and activity of it, introducing divers forms into beings that pertain to each of them, according to the disposition of the matter: also the commerce of all sublunary bodies amongst themselves will exercise your contemplation, which though oft times they seem to fight one against the other face to face; yet they agree in one, and from one the other, all and each of them borrow something. And if Animals and Plants be transmuted, why should that be denied to Metals? which thing, many genuine Ministers and legitimate helpers of Nature boast, and not without reason, that they can do it by Art: and that only by removing of impediments, and by a convenient application together of actives and passives; which being done, the Philosopher leaves the whole

work

The Epistle Dedicatory.

work to Nature only, which by a gentle outward heat, being helped without too much haste, doth raise up an internal fire; which is the Workmaster of the Elixir that must procure health and riches: that I may hiss out Asles, who triumphing in the Lions skin, erect a tumultuous and confused furniture in their Laboratories, and dig forth all things under ground from the very bottoms of Mines, and melt them in the fire, being desirous to make trial of their own dreams.

*Their Patrimonies they together pack,
Plying their hidden work with Coles full black;
When they have spent, and labour'd all in vain,
Nothing they finde, nothing they seek again.*

But passing over these blowers of the Ashes, if you be pleased to reason deeper concerning Insects; you shall finde what will exercise you in the Monarchical government of Bees, the Democratical of Ants, and the œconomical providence of them both: of that in gathering and laying up Wax and Honey: of this in replenishing her granaries, and biting asunder the grains of corn at that end where they spring forth, lest the provision which is gathered with hard labour, and laid up for winter, by the force of an imbred heat in their work-house under ground (which is hot whilst the Winter lasts) should corrupt, being spoyled by a sudden production, and a plague arising, together with a famine overspreading, should destroy the whole nest. Nor can you lightly pass over the Architecture in framing the cells in the combs of wax, mathematically to an exact Hexagon; in the hollow places of a Wasps nest; in the various chambers of the Ant-hill, and winding Meanders: in the joyning together whereof he saw granaries, chambers, hospitals, places of burial, besides the innumerable endowments of these indefatigable creatures, their functions and labours, and he could not admire or praise them sufficiently, who had spent a long time in the contemplation of them, thinking it a work worth his pains, his whole life past being employed in this negligent and very idle business. Silk-worms, all Caterpillars, and Spiders, shew their art in spinning, making snares for Flies, and pitching their nets to provide themselves victuals. The Wood-worms practise graving, with the rasp of their mouthes piercing into the timber: Ants and Bees, amongst other Insects, will teach men piety toward old men, tired, sick men, and their own children: Oyl Beetles sacred to *Apollo*, will teach them to love their off-spring, who never cease for 28 daies to rowl up and down a dung-pil, (which is the receptacle of their seed) from East to West, following the Suns motion, until it be fit to hide in the ground for the production of their young, after the space of a Lunar month, which nature hath assigned for the forming, and excluding of this Worm, which shall at length become a Fly. Here take notice that the male hath a prolifick seed without help of the female, and can generate by it self putrefaction of fit matter interceding in a convenient matrix, though it be not animal. But (that which crowns all the meditations of a Christian man, and carrieth him aloft) consider how the Silk-worm makes her self a tombe, that is unpassable, by reason of her woven work that is most compacted within, in which the Worm contracted into it self seems to die, and by a prodigious metamorphosis it is born anew a Butterfly, a more noble creature, which by the weaving of its wings flies up into the air toward heaven, whereas before its burial it lived a base creeping creature fastned to the earth, and glued to the food of the ground. See whether a little beast that is obscure, of the kinde of Locusts, living amongst the stubble of the fields, when she is consumed with extreme leanness (which from the posture of one that is praying, the *Frenchmen* of *Narbon* call *Pregadien*) do not teach men to hold up their hands in prayer unto heaven, and admonish them to observe a convenient gesture in offering up their supplications unto God. What think you of the greater Beetle, the *Indian* Rhinoceros, which being bred without a female (as the rest of the like kindes are) dies, and riseth again out of her own corruption, like a *Pœnix*, after her change, when she was supposed to be wholly dead. Lastly, what think you of Flies, which when they are drown'd many hours in water, if you bury them in hot embers, you shall revive them again. Truly I doubt not but that amongst those serious cogitations, (the object whereof will seem not so serious in respect of other false appearances of men, that are illiterate and unreasonable) thy minde may rise to its original, and fastning thy eyes on heaven inspired by
God,

The Epistle Dedicatory.

God, wilt cry out, O the depth! and with the divine Psalmist wilt return a Psalm of thanks to the Maker of Nature: *How wonderful are thy works O Lord! In wisdom hast thou made them all, the earth is full with thy possession.* So shall I have whereby I may rejoyce, that however the whole course of thy age hitherto hath been but one continual act of Philosophy, yet that by the rare advantage of this Present which is curious with variety, I have given thee a new occasion of no less solid and profitable, than of pleasant and ingenious meditation. Suffer therefore that a friendly hand may convey into your Library the Off spring of the most learned *Mouffet*, which is now at last published and brought to light, and amongst so many volumes wherewith thy Study shelves are most excellently furnished, assign a place for it, worthy of the Father and the Son. Besides the good things mentioned that shall from thence accrew unto thee, and the very great increase thou shalt reap from the hours thou shalt spend in reading the Book, (if I may jest with thee) thy own profit shall not want its advantage, lest thy proper benefit should here seem to be neglected. In these leaves thou shalt finde what will drive away the plague of thy delights, those beasts that are the greatest enemies to the Muses & their darlings, I mean the Moths that devour Books, which with a greedy belly and iron teeth (though their bodies be very smal) prodigally waste and rend the lucubrations of whole ages. Let those evil beasts that are the most deadly mischiefs of angry nature be destroyed after an ill manner: to prevent the propagation whereof, and to kill their infamous progeny (whilest in the mean time learned writers of Books endeavour to abolish their kinde utterly, or their sedulous Collectors do what they can) this Book (which I send to thee as a remembrance of my love, will teach thee in the Chapter that treats of it. But let it suffice, I began with a small pitcher, why should the wheel run till it fill an Amphora? The heat of good will and fruitfulness of the subject carry me away; I must now take off my hand, lest my Epistle should proceed absurdly beyond the bounds, which already unawares hath increased into a volume. Believe that I am affectionated to thee, and how well I wish and desire to thee, these lines I have written may speak. What remains of thy daies which God hath appointed thee to run the race of thy life, before thou receive thy heavenly reward, I wish thou maist finish without any pain of minde or body; and that I may speak with *Aristotle* writing his last Testament, I pray from my heart, that thou maist live longer here, *for it is well, but if any thing happen*, that thou maist safely arrive and enter gloriously into the harbour of the blessed at the moment decreed. *Farewel.*

From my Study in the Ides of May, and the year
of Mans Redemption, 1634.

A Preface upon the undertaking of this Argument ;
and of the worth and use of it.

THat the History of Insects is worthy of the chiefest Philosophers, the pains of great Aristotle, and Pliny, and of our Wotton in describing them doth sufficiently demonstrate. After their time Conradus Gesner laboured not unfruitfully, to perfect that work which they began; but by reason of his short life, he fainted in the beginning of the race, nor was he able to put an end to it. But when Pennius of blessed memory met with those papers by a better fate, for fifteen years together by infinite reading of all Authors, he enriched the History by the exceeding great help of Quickelbergius, Clusius, Camerarius, Sir Thomas Knivet, and of his most learned brother Edmund, Jo. Jacob, Roger Broun, Brite, but chiefly of our Bruer; and some courtesie of Peter Turner. That is to be lamented, that he also was taken away by untimely death, before he had disposed of the matter and framed it to the dignity of this work, which he had heaped up together on all sides; Hence it was that his Letters were full of blots, and confused with doubtful Characters: and they had perished, had not I laid them apart, when they were ready to be cast out of doors; and with a great sum of money had redeemed all the torn pieces of it. For I had rather something should be taken off from my own estate, than from his glory, who had spent so much pains in the description of Insects, and so much money for the Plates engraving; wherefore this Mans and Gesners and Wottons fragments being disposed in order, adding to them the light of oratory which Pennius wanted, I forged the History, and according to my abilities, (which I know how small they are) I at last brought it to a period. At first I was deterred from it by the difficulty of the work; because I saw that Insects are hard to be explained, both in respect of the unusualness of the subject, and also of the sublime or rather supine negligence of our Ancestors in this point: for they stood still in the very entrance, and they saluted them only by the way, or as the proverb is, at the threshold of the door. I also feared that (which fell out it may be) lest there should want dignity of oratory, for so exquisite a Narration; chiefly when as I oft observed Pennius to be gravelled here, and I seldom went to those that were Artists of words. Also for a time I was detained by examining the causes of Insects; which being unknown, the History can neither be well pen'd, nor rightly conceived. Moreover friends checkt me (and that sharply) that I did but rough-cast another mans building; as though I were one who sought for the Garland in every business, and thirsted after glory more than it was fit for me. They said moreover, that since some worthy honest and profitable end must be propounded to every business that is rightly undertaken, yet none of these was to be found in these imperfect creatures, but I should lose my time, charge and labour exceedingly. By these hinderances I was as it were made fast to an anchor, and left off for a short time to sail any farther: and sometimes taking up my pen, sometimes casting it away again, I was in divers mindes, until that certain reasons allayed these stormings of my thoughts, and did again kindle, as it were, a desire in me to hoise up sail again. I opposed against the difficulty of the work, the desire of attempting things that were very difficult; remembering that for nine years Troy seemed to be impregnable, but was taken in the tenth year it was beleaguered. As for the dignity of the style, I was perswaded that men of a sound judgement would not consider how neatly, but how well I discovered the nature of Insects; for however some mens vain wits, desire much affected eloquence, yet those that esteem of things soberly, altogether reject it. I put off the ignorance of the causes, with the answer of Theophrastus, who though he sunk under his too earnest enquiring after them in plants, yet he did not conceal so profitable a History. It shall suffice us to have measured the causes by humane capacity and mete-yard; for as it is the part
of

The Preface.

of an ambitious man to promise a certain knowledge of them which is only in God, so to have no knowledge of them at all, is the part of a beast. The example of Galen, took away from me the fourth scruple I had; who though he added to Hippocrates but a few things, except the grace of Oratory, and did only open that way of Physick which he had set down, yet is he so placed in the second rank amongst Physicians, that many think him worthy to have the first. Which thing I have not only done in this book, (I am willing to speak the truth concerning my own work) but I have inserted intire Histories, and above a hundred and fifty pictures, which Gesner and Pennius knew not; I have mended the method and language, and I have put out above a thousand tautologies, trivial matters, and things unseasonably spoken: for I have had regard to the squeemish stomachs of men of this nauseating age, that not only loathe Coleworts twice sod, but even Ambrosia twice set upon the table. Notwithstanding how small soever this my pains may appear, (for it cannot be thought no pains) he that shall make trial in something of this nature, he will rightly perceive my labour, and will of his own accord take heed how he go to repair old and decayed houses, with new matter; it had been better to have written a new History than to have mended this which was so tattered and confused. As for vain glory, I desire it may be as far from me, as I wish the light of this History may be near to you. I confess that not to love honour is contrary to mine, and all humane nature, yet so that I hold boasting to be amongst the greatest vices, and I equally reject foolish ostentation in small matters. Socrates, Plato, Hippocrates, have taught us better, who in their times both writ many things, and were exceeding far from the ambition of glory. I know not whether they are to be numbred amongst men most desirous of honour, who publishing nothing of their own, make unlearned men to conceive of them, that they abound with hidden learning; as if they were like bottles forsooth, that were so full, that they drop very slowly or not at all. I shall add this concerning the dignity of this History of Insects, (lest we should think God made them in vain, or we describe them) that in the universal world there is nothing more divine than these, except Man. For however in shew they are most abject and sordid, yet if we look more nicely into them, they will appear far otherwise than they promise in the bare outside. It oft times comes into my minde (saith Gallisardus) to think of our Italians, who commonly admire vehemently things notable for magnitude, or new and unusual; but things obvious in all places, and that are very small they despise; yet if they look exactly to the matter, it will be easie to observe, that the divine force and power shew themselves more effectually in mean things, and they are far more miraculous, than those things the world with open mouth respects so much and admires. If any man bring from far the wonderful Bittour, Elephant, Crocodile, there is no men but runs quickly to see that, because it is a new thing and unusual; and when they have leave to see them as much as they will, they only wonder at their greatness, colour, and such things as fall under the apprehension of their senses. But no man regards Hand-worms, Worms in Wine, Earwigs Fleas; because they are obvious to all men, and very small, as if they were but the pastimes of lascivious and drunken Nature, and that she had been sober only in making those huge and terrible beasts. Nor is this vice peculiar to the Italians only, but it is common to the English and to all mankind; who that they may see those large beasts that carry towers, the African Lion, the huge Whale, the Rhinoceros, the Bear and Bull, take sometimes a long journey to London, and pay money for their places on the scaffold, to behold them brought upon the stage: yet where is Nature more to be seen than in the smallest matters, where she is entirely all? for in great bodies the workmanship is easie, the matter being ductile; but in these that are so small and despicable, and almost nothing, what care? how great is the effect of it? how unspeakable is the perfection? as Pliny saith. Do you require Prudence? regard the Ant; Do you desire Justice? regard the Bee; Do you commend Temperance? take advice of them both. Do you praise valour? see the whole generation of Grasshoppers. Also look upon the Gnat (a little Insect not worth speaking of) that with her slender hollow nose will penetrate so far into the thick skin of the Lion, that thou canst hardly or not at all thrust a sword or javelin in so far. A man hath need of steel to bore into oaks, which the Wood-worm eats hollow with her teeth as the sound can testify, and as if she had Polycletus his graving instrument, she carves out scales. But if I would relate the skill of some of them in building, fighting, playing, working, perhaps I might be thought over-curious in these small things, (of which the Law takes no notice) and

more

The Preface.

more negligent in greater matters. Now I come to their use, and that manifold, and in respect unto God, to Nature, or to Man, very great. For if the Gentiles according to that saying of the Apostle Paul, Know God by the creatures: truly they may hence, as from a higher watch-tower behold his Omnipotence, Majesty, Providence. For some of them are so small, that like those lines Callicrates drew, they cannot be seen but with good eyes, and when the Sun shines very bright: as I remember I once saw a Fly far smaller than a Worm in wine. Would you have a Musician? hearken to the Grasshopper, which is alwaies filled with singing, and lives without meat; and by her most pleasant melody challengeth the Nightingale. Would you hear a Trumpeter? hold your ear to the Bee-hive, hear the humming noise: hearken a little to the Gnat, in whose small beak the great Master workman hath formed that horrid and clanging sound of the Trumpet. Do you despise a Lowse? yet when the Egyptian Magicians deceived Pharaoh by producing the greater creatures, in the forming of this so contemptible a creature, they yeelded the garland to Moses. Wherefore Galen (17. de usu partium) breaks forth rightly into these words, after he had explained the wonderful generation of hairs, and the use of them: saith he, If there be so divine vertue in parts that are so sordid and nothing considerable, how great may we suppose the excellency of the same is which rules in the heart and brain? Truly if a man that is addicted to no sect, would freely enter into the consideration of things, considering the fabrick of any even the smallest creature, and that in every part though never so base, so great vertue resides, he shall easily understand the excellency of the minde which is in man, and from the principles in physick shall ascend to Divinity, which is far better and more excellent than all Physick. I suppose that no nation nor society of men amongst whom there is any Religion of the gods, have any thing comparable to the Eleusinian or Samothracian Ceremonies; yet these do set forth but obscurely the minde of all things which they profess; which is plain enough in the fabrick of all living creatures. For you must not think that in Man only the Art of the great Artificer is so great, as I have explained before, but what creature soever you would dissect, you shall finde the like art and wisdom to appear in it. And such creatures as you cannot possibly dissect, will make you to admire the more, the smaller they are. For if a certain Carver lately obtained exceeding great commendations, and that deservedly, because on a very small Ring he so curiously engraved Phæton riding in his chariot with four horses, that you might see their mouthes, bits, teeth, 16 feet, and all their parts exactly framed: truly since all that workmanship had nothing in it more excellent than the leg of a Flea, it is evident that God that made the Flea, hath more Art and Excellency in him, that not only made it, but that he did it without any labour, and when he hath made it, doth continually feed and nourish it. Wherefore let us leave off to admire any longer the vast and huge Colosse, and with the chief Master of true wisdom, let us descend from the Cedar to the shrub, that is, from the most highest trees to the most contemptible weeds, or rather the most abject of all vegetables. And if he thought that the history of the meanest plant was not unworthy of a King to contemplate and write of, how much more excellent are Animals than Plants, so much more doth this work deserve the patronage of a King, and philosophical contemplation than that doth. When Heraclides had invited some of his friends to his poor Cottage, they stood only before the door, being afraid to come in because the place was so narrow, or the room so foul: to whom he spake thus: I pray come in, here are Gods also: thereby implying that the greatest God was in the smallest matters; and that there was a spirit in all things, though never so despicable. And truly, if the fabrick of Insects were worthy of so great and divine Artificer, how can the contemplation of them be unworthy of the understandings of poor contemptible men? Amongst the souldiers of Palestina, God raised great Goliath, a Giant amongst men; yet would he have him overthrowen by the sling of one poor shepherd. Amongst the Spanish Pilots, how many tall Mariners there were? yet they all submitted to one small Drake, and Neptune himself in a manner yeelded up his Mace to him. The Oke is great, and growes very large; but God destroys it by the slender Ivy that clings about it, that it might not grow proud of its force and might. Farewel then all those that so much esteem of creatures that are very large. I acknowledge God appears in their magnitude, yet I see more of God in the History of lesser Creatures. For here is more of prudence, sagacity, art, ingenuity, and of certain evident divine being. Wouldst thou praise Nature, Gods ordinary hand? from whence

The Preface.

Whence wouldst thou take thy beginning better than from Insects? for where hath he planted so many senses in a Gnat? where (saith Pliny) hath he set the eyes? where the smelling? with what curiosity hath he fastened the wings? with what great art hath he extended the small legs? and disposed the hungry hollow belly, and hath made it thirsty after mans blood? and as the small beak it hath cannot be seen, he hath so made it double by a reciprocal art, that it should be sharp pointed to enter, and hollow to draw it forth. I let pass that admirable variety, comeliness, and fecundity that is in Insects, which commend the riches of quickning Nature in greater multitudes, and set forth unto us the great plenty of it, which cannot be exhausted. If you consider men, as they cure almost all the diseases of mens bodies, (as I shall declare more at large in their History) so they furnish their mindes with variety of examples of vertues, whereby they may instruct their souls, and teach them, that otherwise would be very wicked. Wherefore Solomon the principal Master of true wisdom amongst men, sends sluggards to the Ants hill, and tumultuous people to the bands of Locusts, and incites mortal men to the contemplation of the Spiders in their houses, that from the School of Insects we may learn vertue, and may lift up our eyes unto the power of God, which are too much turned away from him. Go so, saith Tertullian, O Man thou reliest upon thy own strength, and distrustest God, yet consider that there is so great strength in the smallest creature he hath made, that thou canst not endure it, nor ever be able to do as much. Imitate if thou canst the Spiders curiosity, endure the sting of the Spider Phalangium, avoid the nastiness of Lice, take a Gnat out of thy throat, sleep when Fleas or Wiglice bite fiercely, keep thy trees safe from Caterpillars, drive away Weevils, Trees-worms, Vine-worms, and Timber-worms: wherefore as God shews his power more in this more notable Artifice of Insects, so his great mercy is more apparent, because there is hardly any disease of the minde or body, but a remedy may be fetcht from this store-house to cure them both. If men should deny that they contribute very much to feed, and fat, and cure many other creatures, Birds and Fishes would plead for them, and the brute beasts that feed on grass would speak in their behalf: wherefore though with many every thing that is new, or hard to obtain, is most valued, and this is accused by the perverseness of wicked men, and ignorance of unlearned men, to be a work of curiosity, ostentation, and of no profit,

Yet see its shape of things that are so small,
Nature, and Fate, and great originall.

Wherefore I exhort those chief men, which I named at the beginning, who have deserved excellent well in the History of Insects, by communicating both the things themselves and their pictures, that with that humanity they have been assisting to me, and to Pennius hitherto, they would continually proceed in the same for the augmenting of this work: for so shall they be truly accounted, as they are, Physicians sons, and shall most amply set forth the glory of God and Nature. To which if I may appear to have had as much regard as I have had to the certain profit of men by this work, I shall not regard the envy of any man; for I never studied to please all men, and yet I alwaies endeavoured to offer unto the Creator of all things, some part of thankfulness.

THE THEATER OF INSECTS: OR, Of lesser living Creatures.

CHAP. I.

Of the Names, Description, and Differences of Bees.

Of all Insects, Bees are the principal and are chiefly to be admired, being the only creature of that kinde, framed for the nourishment of Man; but the rest are procreated either to be useful in physick, or for delight of the eyes, the pleasure of the ears, or the compleating and ornament of the body; the Bee doth exceed them all in every one of these.

Hebrewes, *Deborah*.

Arabians, *albara Nahalea Zabar*.

Illyrians, *Wexiela*.

Italians, *ape, api, una sticha, moscatella, ape a scoppa, pecchi*.

Spaniards, *Abeia*.

They are called by the French, *mouches a miel*.

Germans, *ein ymme bynle*.

English, *Bee, bees, been*.

Flandrians, *Bie*.

Polonians, *Pzczota*.

Irish, *Camliu*.

The Grecians give divers names to Bees, according to the diversity of Nations, Countreys, and places; for divers nations do attribute divers names to them. But the most common and vulgar name is *μέλισσα*, (but *Hesiod* calls the Bee *μέλισσα*) because they are busied in their work, *ἡ μέλισσα τὸ μέλι*; or because of their sweetness, or rather *μέλι τὸ μέλι*, in regard of their honey, in making of which the Bee is a cunning artificer. For they are *μέλισσαι*, from *μελέω*, because there is no Insect more studious, more industrious, and laborious. *Hesiod* calls them *πυγμαλίσσαι* as also *ἀνδρῖναι*. *Gesner* had rather read *πυγ* for *πυρ*, for it is also called *ἐυδότης*. But *Suidas*, *Aristotle*, and others, do rather make it a Hornet or a Wasp. Although *Gaza*'s interpretation, and the Poets do call it *Apis* a Bee. *Stephanus* calleth them *σμελίδαι*, whence *σμελίδω*, that is, I do hive Bees. *Hesychius* calleth one kinde of Bee *φάειον*, and others call it *πλάστιν* from its framing. They are called also from their destroying of flowers *ἀνθοκτόναι*, that is, destroy-flowers; or *ξανθοί*, that is, yellow, from their natural soyl and seed *βουβώνες*; and in regard they have blunter stings than Wasps, *αἰμα*, and from the sound and buzzing noise of their wings *βομβύλοι*, *βομβύλαι*, though some in *Isocrates* do interpret the name by Gnats, when he writeth that some have writ in the praise of *βομβύλοιον*. But *Bombus* is properly the noise Bees make: *αἰμα*, among so many significations, saith *Hesychius*, *Εἶδος μέλισσας αἰκάντας*, a kinde of stinglee Bee; *Isidorus* calleth him the King or Emperor of the Honey-rents. In respect of his common inheritance, he

Gggg

with

The Name

is called *αἰεῖδον*, an airy inhabitant; in respect of its countrey *ἄλυσον*, as it were the Trojan wood-pecker. The Bees receive also divers appellations and names from their offices and employments, as some are called *ἡγεμόνες*, from their command; some *Ζεφύριαι*, from their sweet singing; some from their work, *ἐργαστοί*, and some are called *πλάστιδες*, or Potters, in regard of fashioning of their combs, or their emplastring of their waxen houses, wherein the Bees do secure themselves from the injury of the wind and rain. The Latines call these Insects by one name, *Apes* or Bees. *Varro* calleth them sometimes Birds, but improperly, for they are flying creatures but not Birds. Some think they are called Bees, because their swarms do cleave together by the feet, like a bunch of grapes. And beside the most conceive that this name of *Apes* is compounded of *a*, a privative particle, and *pes*, a foot, as if they were produced without feet, as *Virgil* saith, *Trunca pedum primos*, that is, lame or deprived of feet. *Servius* is of the same opinion. And truly the new fresh brood (which the Grecians call *ἄλυσον*) do want feet, but in the time appointed by nature, out of the crusty and waxy comb the Bee doth creep forth. But in regard it keepeth not this analogie of the name of *Bipes*, *edis*, *Tripes*, *edis*, *compes*, *edis*, the name is more simple, from whence comes the Diminutive *Apicula*, or a little Bee.

Apes or Bees
whence so cal-
led.

The Definiti-
on of the Bee.

The Bee is an Insect living creature, four-winged, bloudlesse, skilful only in his artificial making of honey. For he that writ *the Garden of Health*, seemed to dote much, by confidently affirming that Bees were four-footed beasts, for Nature only bestowed on them four feet that they might go upright, and not more, lest it might hinder their flying. But omitting this futile Author, let us more amply describe this most profitable and wise Insect.

The Descrip-
tion of the
Bee.

Their eyes are honeyey and made inwardly, and so is their sting, neither do they want tongue, and teeth; they have four wings, which are dry (as those of all other Insects) shining, and fastened or joyned to their shoulders, the last whereof are the least, that they might not hinder their flying; two claws as it were growing forth of the ends of their little feet, between which in stormy weather they carry a stone to poise and ballance their light bodies, lest the impetuous violence of the wind should drive them from their houses; and therefore we need not give credit to *Lucian*, that they ought to be called *Ζῷα ἀπόδα*, footlesse creatures. They do not breath (by *Pliny's* favour) but pant, and are refreshed by transpiration. Their stomach is framed of the most thin membrane, wherein they not only conserve and keep their collected honey, but concoct, and purifie it; which is the reason that Bees honey may be kept longer then any Manna or aerial body, or rather is altogether incorruptible, as we will shew hereafter.

Aristotle 9. *Hist. cap. 10.* saith that there are nine kindes of Bees, six whereof are sociable, and do live together, as Bees, the Kings of Bees, Drones, Wasps, Hornets, Moths. Also three solitary and inociable, the greater Siren, the lesser Siren, and the Bumble-Bee; of which kinde *Simius Albertus* does reckon up nine, but gives them such harsh and barbarous names, that it seems he rather faigned them, than knew them. *Lib. 8. tract. 4. cap. 2.*

But Bees do differ, and are distinguished in regard of their matter, form, wit, disposition, and office, and these are all their genuine, and natural differences, which I have collected out of infinite Authors. Concerning their matter (if we may credit the curious searchers into the works of nature) some of them are called *λεογονίαι*, or the Lions brood; others *ταυρογονίαι*, the Bulls brood; and some *βόπυδιαι*, or the Oxe brood; and some *μοχογονίαι*, or the Calves brood. But the best and noblest bees are generated and bred out of the Lion, and the Kings and Princes of them do derive their pedigree and descent from the brain of the Lion, being the most excellent part of his body: it is no wonder therefore if they proceeding and coming from so generous a stock, do assail the greatest beasts, and being endued with a Lion-like courage, do fear nothing. The noblest Bees next unto these, are those that are generated out of the Bull, being also a strong and valiant beast, the excellency both of their disposition and bodies being equal to their stock and pedigree. The next are the Cow-Bees, or Oxe-Bees, which are indeed very industrious, laborious, and profitable, but of a milder disposition, and lesse inclinable to anger. The Calves carcase doth generate more soft and tender Bees, excellent makers of honey, but not able to endure labour, in regard of their tenderness, and in regard of the weakness of their matter short lived. Some also do write, that Bees may be bred out of their own ashes sprinkled with honey, and laid forth in the sun, or some warm place, which sort may be called in Greek *αὐτοπαίδες*, or Self-begetters. Bees of the best shape are small, variously coloured, round, and bending; the worse shaped are long. The difference of their formes and shapes ariseth from four causes; Nature, place, sexe, and age. For some are domestick, or house Bees; others are wilde or wood Bees, these delight in the familiarity and company of men, but not the other, which do exercise themselves in making honey in trees, clefts and crannies of the earth, and in the rubbidge of old houses and walls. Again, some of the tame and gentler sort of Bees, do live in pleasant gardens, decked and beautified with all sorts of flowers, these are great, soft, fat and large bellied: others are kept in villages, going far for their food, and feed on flowers they light upon by chance. The lesser more hairy, yet for their work, industry and skill, they exceed the other. Of both kindes some are bred with stings (as all true Bees are) and others without stings, as the bastard Bees, which have a greater and softer belly, throat and body, but not famous either for manners, or ingenuity. They call this kinde of Bee the Drone, because they seem to be

The difference
of their shapes
from nature.

be laborious, and are not; or because under the colour of labour (for they sometimes carry wax and diligently fashion their combs) they devour the honey. And these are of a black shining colour and larger bodied. Moreover some bees are descended from their Kings and Dukes, whereof *Aristotle* maketh two kinds. The yellow, which is the best, and the black streaked. Others do reckon three Kings, differing in colours, black, red, and spotted, or streaked. *Mencrates* doth report, that the divers coloured are an inferior sort of Bees; but those streaked and diversified with black, are the better. All of them are twice as big as other Bees. He that is elected Monarch or King of the whole Swarm, is alwaies of an excellent shape and twice as big as any of the rest; his wings are shorter, his thighs straight and strong, his gate loftier, his aspect more stately and majesticall, and on his forehead a white spot like a shining Diadem or Crown, differing much from vulgar Bees in regard of his shining colour. But the place doth alter, sometimes their form, and sometimes their nature, sex also and age do change them in both respects. For in the *Molucco* Islands Bees are like to winged Ants, but somewhat lesser than the greater sort, as *Maximilianus Transylvanus* in his Epistle to the Bishop of *Salisburg*, eloquently relateth: In *America* near the Rivers of *Vasses* and *Plate*, the Bees are not like ours, being no bigger than those small flies which trouble us in summer, they build their nests in hollow trees, and they make far greater combs and fuller of holes; the end or tip of their wings (as *Oviedus* and *Thevetus* relate) seem to be bitten or cut off, in the middle whereof they have a white spot, and they have no offensive stings. The wax which they make is of a dusky pitchy colour, and they are for the most part evil conditioned. *Aristotle lib. 5. hist. cap. 22.* mentioneth a certain kinde of Bee, that is of a soft industrious nature, which maketh honey twice in a moneth, being of a gentle pleasing disposition, and busied only in making of honey. Such there are also in the Countrey of *Peru*, which do make a soft and melting kinde of honey, which do stop their doors so close with wax, that they leave but a very small hole for their ingresse or egress. But almost all our Bees in *Europe* are of a blackish colour, not so much in regard of the easie concoction of thin substance, than that they seem to be of a grosser diet, and of a thicker compoſure, and therefore the thicker matter doth remain within the skin, which the Bees of *Peru* and *Pontus*, by reason of their thin skins, and the finenesse of their dewy nourishment, do easily thrust forth; unlesse that be the cause, we must ascribe the variety of colour, to wanton nature: as we do for white bears, and white black-birds; which seeing she her self is various and of many shapes, it is no wonder, since she delights in variety of colours that she hath not made all Bees of one colour. The kinds of common Bees, (as *Columella* observes out of *Aristotle*) are thus distinguished; some are great, round, black, hairy: others are lesse, round, of a dark colour, rough hair: there are yet others lesse than they, and not so round, but more fat, of a straw colour on their sides: there are some least of all, very slender, sharp, whose bellies are various coloured from yellow, and very small. But the blackish are most to be approved of, that are very little, round, lively, shining, gentle, having (if we credit *Virgil*)

Their bodies shine with equall spots of gold.

The greater Bees are, and fatter or longer, the worse they are: and if they be fierce and waspish, they are worst of all. But their anger is pacified by the daily company of their keeper, and they are made more tame with the only tinkling of brasse. The Bees called *Chalcoides* in *Crete*, are of a brazen colour, and something long, and are said to be very implacable and given to fighting, exceeding all others in their stings, and pricking more fiercely; so that they have driven the Citizens out of the Towns by their stings. And *Ælian* out of *Antenor* relates, that in the Mount *Ida*, the remainder of that race, dwell and make their combs. Such are also the Bees at *Carthage* like to Muskitos. *Pausanias* writes in *Articis*, that Bees are so gentle in *Halizomus*, that they go forth to feed amongst men, and wander where they please, for they are shut up in no hives; wherefore they make their works every where, and that so fast, that you cannot part the honey from the wax. They are smooth, shining, of variable colours, and not unlike to our good Bees. Lastly, since all Bees are by nature void of poyson, yet the place causeth the long Bees, and the distaffe fashioned, about *Carthage* in *America*, to make venomous honey; where they collect honey that is infected with the contagion of trees, winds, air, and earth it self; and be it what it will be, they lay it up in their cellars. Also Bees subterrestrial have another form and nature. For those that work in hives and trees, are greater, longer, softer, better wing'd, more yellow on their backs and bellies. But they that are under the earth build in little holes, and are short compacted, with black heads and foresails, hairy almost on their whole body; a yellow down colour on their sides and rump, and that doth much adorn them. Of Bees, some finde themselves houses in woods, some are received into houses made of straw or horn; some civil and well nurtured Bees, who will not refuse the care of the Bee-master who hath skill, but will much love and delight in it. The prince of Philosophers confounds the sex of Bees: but most writers distinguish it: some say the females are the greater, and without stings; others say they are lesse and have stings. The founder Philosophers, (whose opinion I follow) acknowledge no males but their chief leaders, which are more strong, greater, more able, and alwaies stay at home for propagation, and seldome go forth but with the whole swarm; whom nature hath commanded to be frequent in Venus occasions, and ordained them to stay alwaies at home

The difference of their minds from the place.

Differences of the corporeal form from the place.

Difference from their Sex.

with their females. Experience witnesseth, that these do foster their young as birds do, very diligently, and sit upon them, and thrust forth their young Bees, when the membrane is broken. The differences of their Ages are known by the habit of their body: for those that are new come forth have most thin and trembling wings; those that are a year old, as also, of two or three years old, are very bright, neat, and are of the likeness and colour of oyl; but at seven years old they lay aside all fardness and smoothness; nor can any one tell certainly by their figure and quality of their skin and body (as it useth to be with horses) how old they are. The elder of them, are hairy, hard, full of wrinkles, lean, rough to your sight and feeling, long, starveling, and noted by a venerable kinde of hoariness. And this was shewed to the Dutchesse of *Somerset* when I was a youth, under whose chamber window there was the very same hive of Bees that had been there 30 years, and this justifies *Ælians* relation of the same kinde. But as they appear more ugly in form, so are they before the rest in industry and experience, for years have taught them skill; and by length of time and practise, they know better how to gather and make honey.

CHAP. II.

Of the Politick, Ethick, and Oeconomick virtues of Bees.

BEES are swayed by sovereignty, not tyranny, neither do they admit of a King properly so called, by succession or by lot, but by due advice, and circumspect choice; and though they willingly submit to regall authority; yet so, as they retain their liberty; because they still keep their Prerogative of Election; and when their King is once made sure to them by oath, they do in a principal manner love him. He as he doth excell all the rest in portlinesse and feature of body (as is above said) so likewise (which is the chief thing in a Prince) in gentleness of behaviour. For although he hath a sting as others, yet he never useth it to punish withall, inso-much that some have thought that the King is without a sting. For their law is the law of nature, not written but imprinted in their manners; and they are yet more gentle in punishing, because they have the greater power; and although they seem somewhat slow in revenging private wrongs, yet suffer they not the refractory and rebels to go unpunished, but wound and stab them with their stings. So desirous they are of peace, that neither with their wills nor against, do they offer any annoyance. Who would not then utterly abhorre the *Dionysian* Tyrants in *Sicily*, *Clearchus* in *Heraclea*, *Apollodorus* the *Cassandrian* Robber? Who would not detest the villany of those close Parasites to Kings who affirm that Monarchy is no other, but the means how to accomplish or satisfy the will, and a device how to maintain lust? that which ought to be far from a vertuous Prince, lest while he would seem to be a man, he betray himself to be worse then these little winged beasts.

And as their manner of life is not pedantick or according to the vulgar sort, so neither is their birth. For the royal Race is not begotten a little worm at the first, as the Bees are, but presently able to fly.

And if he chance to finde amongst his young ones any one that is a fool, unhandsome, hairy, of an angry disposition, ill shapen, or naturally ill conditioned, by the unanimous consent of the rest, he gives order to put him to death, lest his souldiery should be disordered, and his subjects being drawn into faction, should be destroyed. He sets down a way to the rest, gives order what they shall do, some commands to fetch water, others to make honey-combs within, to build them up, and garnish them; othersome to go and get in provision: those that are stricken in years he cherisheth at home, the younger he exerciseth in labour and vicissitude of employments; and although he himself hath immunity from mechanick labour, yet as cause shall require, he also refuseth not to work; nor ever doth he go abroad but for healths sake or necessity. If he be by reason of age in health, he marches as General in the Vantguard of his Army, and in person opposeth himself to all encounters; neither is he born by his attendants willingly, unless it be when he is so old and diseased that he cannot either go or fly. When night comes on the signal being given by the Trumpeter, the common sort are commanded to their lodging and the watch being set, every one betakes himself to his rest. As long as the King lives, all the swarm enjoyes peace, and all things are in quiet; for the Drones keep themselves willingly in their own cells, the elder Bees are content with their own places, nor do the younger run out of their own into the elders lodgings. The King lives apart from the rest in a more eminent and large palace, with a waxen fence curiously made, compassed about as it were with a kinde of wall. A little way from him dwell the Kings children, to whom if their father or mother do but hold up the finger (as they say) they are hush.

But the King being dead, the subjects are perplext, the Drones lay their young ones in the Bees cells, and all things are out of order. *Aristotle* makes mention of more Kings or master Bees than one in a swarm; which I had rather terme Vice-royes or petty Kings; For as much as *Antigonus* tellieth, the Swarm is in no lesse danger when it hath many Kings, as when it hath none at all. And so much be spoken of the good Kings. The bad are more hairy, and

more

more dark, black and various coloured; you will condemn their skill when you observe their habit.

*Their Kings in face and person differ, one
Bright, as it were with golden spangles drest;
And gorgeous glittering scales, to look upon;*

*The other's a foul, sordid, dusty beast,
Sluggish, large pauncht, unworthy of the Train.
Kill this, but give the other leave to reign.*

And thus far of the Kings and Nobility, now let us proceed to speak of the vulgar sort or Commonalty of the Bees.

Bees are neither wilde nor tame creatures, but a middle kinde of nature between both, but of all in a manner the most serviceable and most profitable. Their sting both keeps them alive and kills them; for if that be once lost, they cannot live, but being armed therewith, they guard the Swarm from all hostile invasion. There are none of them idle, although all do not, have not the skill to make honey: neither do they which can do nothing at all, become like Drones; for they do not, as they do, spoyl the combs, nor steal the honey. But they themselves are nourisht by the flowers, and flying abroad with others feed together with them. Albeit also there are some amongst them have not the industry to make and store up honey, yet every one hath his work, and his art wherein he doth imploy himself. Some bear water to the Kings, and to such of the Bees that are spent with old age, and are decrepit.

The more ancient and graver sort of Bees are chosen to be of the Kings Life-guard, or Esquires of the Kings Body; if they be any way in health, as being of known trust, and well seen in the right ordering and managing of State-affairs. Others of them administer Physick, and undertake to cure such as are sick; and of the Annise-flower, Saffron, and Violet, collect together, compound, and give them to drink, a most medicinable and cordial Honey. If any of them chance to die by reason of Age or sicknesse, forthwith the Bearers meet together, which carry forth the Corps on their shoulders as on a Beer, out of doors; lest they should any way pollute or defile their clean and neat Hives with any uncleannesse, filth or putrefaction.

Neither are the Bees without their commanders, Captains, Lieutenants, Trained-bands, Cornets, Trumpeters, Fifes, Scoutmasters, Watchmen, and *Souldiers*, an Army which do (as if it were a little City) guard and defend their Honey: and do in condign manner punish and torment the Dors that fly thither, and Worms that undermine them.

Lest they should be taken for Drones, as they fly they make a buzzing or humming noise, which according as they begin to fly or cease, is heard or not heard; which sound whether it proceed from their mouth, or from the motion of their wings, *Aristotle* and *Hesychius* do much contend about. Neither was I ever so quick sighted, as to determine of a matter so exceeding intricate and obscure. But the Fifes, and Cornets, seem to make that sound or noise which *Hesychius* calls *Συρ*, the English call it singing; and that they make their signal or watch-word when they are to watch, when to sleep, when to go to work.

So great is their care of preserving their King, that they suffer him not to go abroad alone, but gathering close together on both sides, their company being divided, they hem him in and guard him as he goes along. But if perchance in their journey the King shall wander out of the way, or shall be gone out of sight, being driven by violence of stormy weather, then all make search after him, and do follow him by the scent as it were, till they know certainly what is become of him. And if he be tyred with flying, or tediousnesse of weather, the company bearing him up with strength of their wings as it were in a Chariot convey him home. If he die, all of them go their waies; or if they chance to stay some time after, they make only combs, but no Honey; and within a while after, being altogether idle, full of diseases, starved, wallowing at last in their own filth, they miserably end their lives.

Without a King they cannot be, against whom they make not the least resistance, much lesse do they put him to death, unless as tyrants are wont he make his lust the rule of his Government, or being negligent of the Common-wealth, takes no care of it: yea if he use often to remove from place to place (which he cannot do without great detriment to his subjects) they do not forthwith kill him, only crop his wings; and if he amend his manners, and demean himself as he ought to do, afterwards they love and respect him as well as ever they did before.

If he shall fly away and leave the Swarm, they send for him back again, and if he fly out of the Kingdome, they follow him; and finding him out by his scent as it were by a track (for above all the rest, the King or Master Bee hath a very curious smell) they bring him back unto his royal Palace again. Not a Bee whatsoever dares go out of doors to feed any where, unless the King or Master Bee go out first and challenge his priviledge of precedency. For I am scarce of *Aristotles* minde, that the King never goes abroad except it be with the whole Swarm, which is a very rare thing. But when the Swarm by reason of the tyranny of their Prince are forc'd to remove to some other place, changing their soyl and habitation, as unwilling so to do, then they make an unwonted noise, as it might be of a trumpet some daies before; and two or three daies before, a few of them hover up and down about the Hive. But when all things are ready for flight, away they fly all together, and if the Tyrant whom they left behinde pursue and follow them, they kill him.

But a good King they never desert, and if he die by any infection, sickness, treachery, or old age, the Nobles, together with the common people lament and bewail him; neither do they afterwards go abroad at all, or fetch in any provision, but fill all their houses with a sorrowful murmur, and thronging about the Corps, make most tragical lamentation. Afterwards privately conveying him from the common multitude, they carry him out of the Hive, and make a most doleful cry all about the place. Nor doth a day put a period to, or abate their sorrow, but they continue it so long, till by reason of grief and hunger they all die. Take the King or Master-Bee, and you take all the Swarm, if you misse of him, all the rest convey themselves away and go to others. They cannot endure more Kings then one, the house of the usurpers they throw down and destroy their family. But if it be so that there be two Kings or Master-Bees in one Swarm, (as sometimes it falls out) one part adheres to one King, and the other to the other; whence it comes to passe that in one Hive divers forms of combs are found: where they so behave themselves, that the one doth not entrench upon the others bounds, or invade his Territories.

And as for their Oeconomick or household vertues, they use Parsimony as the chief stay of their family, and having in the summer season gathered a sufficient stock, or store of honey, they do not profusely lavish it, but sustain themselves with it in the winter, and that very sparingly; and so feeding themselves with a sparing diet, and that of the best and purest food, they gain that as a reward of their sobriety, thereby to lengthen their lives, and prolong their daies. Neither are they so gripple or fardily parsimonious, but that when they finde that they have gathered more honey then will serve the number of their family, they do freely impart and communicate some portion thereof to the Dors or Drones.

These also are arguments of their cleanlinesse, that they never lay the excrements of their bodies (unlesse sickness, extremity of weather, or meer necessity compell them) in their Hives; as also that as soon as any of them dye they presently carry them forth, and quit the Hive of them; no flesh or putrid matter, no withering herb, no fading or stinking weed do they touch or come near. They never kill their enemy in the Hives, they drink nothing but the purest running water they can get, they will by no means remain or dwell in an unclean, sluttish, nasty house or room. The ordure of those that labour, and of those that are sick within, they lay upon a heap together without doors, and as soon as they have any leisure, the bearers carry it away.

Neither are they altogether impatient of musical sounds, as other ruder sorts of creatures are, but are very much taken and delighted therewith; provided it be without variety, simple and unaffected. And although they cannot dance by measure or according to the just number of paces, as the Elephant is said to do; yet according as he that rinks on the brazen kettle, pleareth, so they slack or quicken their flying; if he beat fast and shrill, then they mend their motion, if dully and slowly, then they abate it. Neither hath nature only made them the most ingenious of all other creatures; but very tame, and tractable by discipline and education to the keeper of them; for they are all at both his beck and his call, and whatsoever he pleaseth to do, none of them gainsay or forbid. If he beat them, they complain not, and if he rob them and spoyle their combs, they make not the least murmuring, or shew the least discontent. Who would not say this were an argument of a most noble and generous disposition, so to suffer the rigid commands of their keeper; and yet by no means to obey or subject themselves unto the discipline of any stranger whatsoever?

It is wonderful what some do observe as touching the temperance and chastity of them; for whereas all other beasts, the Elephant only excepted, do couple in open view, and the Wasps not much differing in kinde from them, do the like; the Bee is never seen to generate openly, but either doth it within doors with modesty, or without when none shall be by to observe it.

Neither, as the report goes of them, are they lesse valourous then they are chaste or temperate.

*Whilest they expose their bodies in the war,
And nobly dye, receiving many a skar.*

Their war is either intestine or civil, or foreign and with strangers. Of their Civil wars there are divers causes, as the multitude of the nobility treacherous to King and State, dearth of victuals, narrowness of place, when they are not able to live by one another; as also corruption of manners, and sluggishness. Now if they superabound in Nobility (as sometimes it falls out) they put to death so many of them as seem to be superfluous; lest their number still increasing they should force and over-power the King himself, or entice the common people into sedition. But they destroy them then chiefly when they have but a small issue, and have not where else to bestow them, those together with their combs (if at least they have gotten any) they throw down, and pluck to pieces. The Dors also and Drones they kill, as often as they want room for their works (for they take up the innermost part of the Hive) and take away from them both their honey and their victuals. As also, when their honey fails, and there is a dearth, then they go to pell mell amongst themselves, and fight as it were for life and blood: the short Bees they fall upon the long, the smaller sort set upon the Drones (as idle and unprofitable) with all their

their skill and force they can use. In which conflict if it so come to passe that the short Bees have the better, they will prove an excellent Swarm; but if fortune give the longer the day, they will live ever after idly, and make no hony worth any thing. But that side which overcomes is so mightily bent upon rapine and revenge, that it puts all to the sword, yeelding no quarter or truce at all.

As concerning their war with forein Enemies, there is no creature under heaven so bold and adventurous as they are, inasmuch, that whatsoever, whether man, or beast, or bird, or wasp shall molest them, vex and seek to destroy them, they sharply set themselves against, and according as they are able wound them with their stings. Unclean persons, or any that use sweet oyls or perfumes about them, or those that wear curled or ruffled locks, or red clothes (as resembling the colour of blood) they cannot in any wise endure; as also all base and vile companions. Whereas on the contrary their masters, keepers, governors, and those that make much of them they do most dearly love and affect, and sitting upon their hands in stead of stinging them, they seem rather to tickle, and as it were by way of sport to lick them without any the least harm at all. Yea they may have free leave when they are uncovered in the heat of summer, to gather their Swarms with their bare hands, to handle them, to dispose of them at pleasure, to toss them to and fro, to sit or stand before the Hives mouth, and therehence to drive away the Dors, Drones, Wasps and Hornets with a wand. But if any of them have lost his sting in skirmish, as a souldier having his amies taken from him, he is quite disheartned, and living not long after dies with grief.

When they go forth to battel, and are ready to give the onset, they tarry while the signal is given, and then they surround their King (if he be one they love) and in one battel determine the quarrel. But in the fight, what wonderful valour, strength and courage those little beasts do shew; both I my self have seen and know, but they far better who report that whole fields of armed men, have been conquered by the stinging of them, and Lions, and Bears and Horses slain with them. But yet (as fierce and warlike as the are) by daily converse with them they become tame, and unlesse they be provoked they live very quietly, so that any man may stand before their Hives, if not on purpose to disturb them, and they never offer to hurt him.

But if we should go about to set forth at large their ingenious disposition, cunning workmanship, industry and memory, we should not with *Virgil* the Poet yeeld them only to be endued with a small portion of divine inspiration, but even wholly to be possesed with a rational soul, and (to erre with *Pythagoras*) to have the understanding of the most ingenious man infused into them by a *μετεμψυχωσις*.

For as soon as they are lodged in a clean and sweet Hive, they gather from those plants that distil moisture and yeeld gum, (as from the Willow, Elm, and Reed) and even from stones themselves, a kinde of Glue very thick and clammy, and with that (which the Latines call *Commofis*, the Greeks *μύλος*), they lay the first foundation of their work, and dawb it all over as with the first plaister or rough-cast, the which afterwards they cover over again with a kinde of wax mixt with rosin and gum, last of all with Bee-glew. When this tripple wall is artificially finished, they do not only deceive the most curious and intent observer of their works, but without any man taking notice, they do better and better arm and fence themselves against wind and weather, vermine, and all their enemies whatsoever. When this is done they frame their Honey combs with that skilful Architecture, as that they may seem to put down *Archimedes* himself in his own Art. For first of all they build the cells of the King and Nobility in the upper or more eminent part of the comb, large, fair and stately, wrought with the most pure wax of all; which also the better to secure and defend the Kings person, they compasse round about as it were with a certain fence or wall. And as their Bees are of a threefold sort or condition, so they make a threefold division of their cells. Those that are aged and stricken in years (being to be as counsellors of State, and Elquires of the Body) have their lodgings near the Kings Court; next of all to them, those of the first year, or young fry, those of riper age, and lusty in body they place utmost of all, as those that should be able to fight for their King, and the royal Issue. Notwithstanding *Aristotle* writes that they first provide cells for themselves and their issue, afterwards for their Kings, and last of all for the Drones. And as in the making of their combs, they fashion them according to the largeness, and figure of the place; and those either round, or long, or square, &c. according as they please, and sometimes eight foot in length; so on the contrary their cells are tyed to a strict Geometrical form exactly, to wit, Sexangular, or with six corners, only just fit and no more for the bulk of the inhabitant.

But those cells where they make their Honey, and those which are for nurseries for their young ones, are all double from one side of the Honey comb to the other, separated one from the other with a thin partition or mound.

Those Ligatures whereby the Combs are fastened to the side of the Hive, are more straight and are empty of honey, being also much more firm and strong, that they may the better bear the rest of the weight which depends upon them. Those Combs likewise which they cover or plaister most with wax, in those they use to store a greater quantity of Honey, as in a more safe and secure repository.

Now the whole Honey Comb contains four ranks or divisions of cells, the first the Bees take up, the next the Drones, the third the Gentles, and the fourth and last is set apart for a storehouse for Honey.

Their

There are that affirm that the Drones do make Combs in the same Hive with the Bees, but cannot make any Honey at all; whether it be by reason of unwieldiness, or corpulency of their bodies, or their natural inbred sloth, is uncertain. But if their Combs begin by reason of the weight of the Honey to shog, or to be ready to fall, they raise them up and under-prop them with arched Pillars, that they may go under them, for to every Comb there must of necessity be a ready passage) and whereby they may execute their several offices which are appointed them. In some places as in *Pontus* and the City *Anisum*, they make white Honey in trees without any Hives at all. But as for the others in making their Combs so beyond all humane Art, who would not acknowledge for truth, that of the Poet,

*Esse Apibus partem divinae mentis & haustus
Aetherei.*

That the Bee hath in it a particle of divine understanding, and heavenly wisdom? Who I say will deny them to have fantasie, memory, and some kinde of reason? But I will not argue the truth of this, neither will I affirm with *Pythagoras*, that the souls of other wise and ingenious creatures, or of men, do passe from them into the Bees. But yet notwithstanding he that shall warily weigh and observe how they give out to every one his several task, some to make Combs, others to gather Honey, dresse up their rooms, cleanse their laystals, to prop up and repair their ruin'd fences, to cover their boxes, to draw out the spirit of the Honey, to concoct it, to bring it to their cells, to serve those that are at work with water, to give food at certain set hours to those that are bed-ridden, feeble, and aged, with so great care to defend their King or Master-Bee, to drive away Spiders and all other their invaders or annoyers; to rid their Hives of their dead, (lest their work should be marred with stench or putrefaction) to be able every one to return to his particular cell: in a word, to seek their living as near home as they may; when they have sucked dry the neighbouring herbs or flowers, then to send out spies to see for pasture farther off, upon any night design or expedition, to lye under the leaves of the trees lest their wings being wet with the dew, their speed home the next day should be hindred; in boisterous weather, to poise or ballance their light bodies with a little stone taken up into their mouthes, and when the wind blowes hard, to recover the windy side of the hedge to shelter themselves, and the like; surely he will confesse of his own accord that their Common-wealth is wonderful well ordered, and that there is very great discretion and understanding in them.

I had almost let passe that natural sympathy, or affection, that great constance seldom seen in Parents of this Age, wherewith they care for their young ones, in the Hive where they have laid them they sit upon them as birds do, and never go abroad unless enforced with extreme hunger; and when they do, they presently return in again, as if they were afraid lest the Spider if they tarried long (which many times happen) should cover the mouth of the cell with his web, or their little ones being benumm'd with cold should be in danger to be starved. But yet neither are their children delicate, or nicely brought up, for at three daies end (as soon as they have any wings) they set them to work, and have a strict care that they loyter not, or take a haunt of Idleness.

So much foreknowledge likewise have they, that they can preface rains or cold weather to come. And then (by instinct of nature) they never go far abroad, but hover about their stocks or Hives, and sit upon them as upon flowers. When they go forth to pasture (which is not at set times, but only when it is fair weather) then they labour and toyle so hard, and so lade themselves with Honey, that oftentimes through weariness they fail in their journey, being not able to reach home; and whereas some of them by reason of roughness and hairiness become unapt for labour, then they rub themselves against rugged stones or the like, till they be smooth again, and so they buckle to their work afresh as hard as they can drive.

The youth or middle aged Bees are employed abroad and bring home those things which the King or Master-Bee gives them in charge, the elder sort take care of the family at home; and do order and dispose of the Honey which the middle aged Bees gather and make abroad. In the morning they are all still and silent till such time as the Master-Bee gives three hums and raiseth them up, and then every one makes haste out to his several employment. In the evening when they return home, they at the first make a great noyse and tumult, and within a while afterward by little and little cease, till at length the Captain of the watch flies about and makes a buzzing, as it were commanding them to their rest; after which signal given, they are all so hush and still, that if you lay your ear to the Hives mouth you cannot perceive the least noise they make, so subject are they to their rulers and governors, and at their beck and nod are presently quacht.

CHAP. III.

Of the Creation, Generation, and Propagation of Bees.

FOrasmuch as Philosophers have given out that Bees (for the first sin of mankind) are begotten of putrefaction; there are not wanting those that deny they were created in the first week of the world: I leave the question wholly to be determined by others; although some Divines, especially *Dubravins* and *Danaus* do abundantly affirm that they were created with the perfect Bodies. Creation.

Of the first Generation of Bees *Aristotle* hath a long discourse. The Philosophers following him have rightly determined in my opinion, that their Generation doth proceed from the corruption of some other body: as of a Bull, Oxe, Cow, Calf, very excellent and profitable beasts: the which not only worthy men and without all exception do report; but even rustical, and common experience doth confirm. They say that out of the brains of these beasts are bred the Kings and Nobility, and of their flesh the common sort of ordinary Bees. There are likewise Kings that are bred out of the marrow of the chine-bone, but then those that come of the brains do far excell the other in feature or comeliness, in largeness, in prudence, and in strength of body. Now the first transformation of this flesh into these Creatures as it were by a kinde of conception you shall then perceive to be when as these little imperfect creatures appear in great numbers about the Oxe, Lion, &c. in a small white hew, and as yet without motion; but increasing by degrees, and their wings by little and little growing out, they come to their proper colour, flying to and hovering about their King or Master-Bee; but yet with short wings and trembling as unaccustomed to flight, and by reason of the weaknesse of their limbs. Now what countreys do most conduce to the generation of Bees, and what are most hurtful to them, we shall afterwards handle when we come to treat of Honey. But in general there are very few places in the world to be found, (unlesse it be in a very barren countrey, and unwholsome air, and where no food fit for them can be had) in which Bees cannot breed and very well live. But where there is perpetual frost and snow (as in *Scanzia*) or where the countrey is barren of herbs and trees, (as in *Thule*) there they are neither able to breed nor live. As also for the poisonous condition of the airs and nature of the soil some sort of Bees do not endure to live there, as in the Isle of *Myconos* it is reported, that if Bees be carried thither (if *Ælian* be to be believed) they presently dye. But whereas *Munster* saith of *Ireland*, and *Solinus* of *Great Britain*, that those Countreys are altogether without, and that they cannot live there, if they had not spoke rather by hearsay, then of their own knowledge, they would have written that every village or town almost is full of them. And thus much may suffice to have spoken of the Generation of Bees; come we now to their Propagation; concerning which Authors have divers opinions. Generation.

Some say they never couple, or bring forth, because no man ever yet saw or could tell whether they did so or no. Others say, that when they have shed their seed upon the flowers or leaves of trees, they carry it to their Hives, by diligent and soft sitting upon it, it comes to perfection. *Pliny* will have it gathered from the Flower of the Honey-suckle, or Honey-wort. *Aristotle* from the flower Calander, so called; *Athenens* of the Reed-flower, some of the flower or berry of the Olive; taking that for an argument, that in those years wherein these flowers are most plenty, there are great store of swarms of Bees; but when there is scarcity, then few or none are to be seen: when as yet they do not consider or observe, that even in very cold countreys where none of these flowers grow, nor are so much as seen, there are plenty of Bees. I am of opinion that they are propagated by copulation, and am confident the male Bee is the greater, the female the lesse, who whether as Cocks do tread their Hens, so they accordingly engender, let experience reach: yet certain it is, that the lesser Bees only, to wit, the females do sit upon the eggs, and the shells being broken (after the manner of Hens) they do by an admirable and natural midwifery put forth their young. Propagation.

Aristotle on the contrary affirms, that the Kings or Master-Bees themselves do first bring forth, and afterwards all the rest, as those also do the Drones, but the Drones beget nothing, and so their generation ceaseth. And this it may be, not without some reason, in regard that the Kings or Master-Bees alwaies remain within, as if they were ordained by nature only for procreation, neither ever appear abroad but when together with the whole Swarm they go to some other place to dwell. For the same reason also they are so extremely beloved of all the Bees, and live exempted from all necessary businesse and labour. These do also excell the other Bees both in bulk of body and strength, as if their bodies were by nature made only for breeders, But the greater Drones keep a mean between both, and hold such a loving correspondence with the labouring Bee, as that they may nourish both the Drones their Nephews, and the Kings their Parents. But as for that which the Philosopher addes, that Bees do not engender by way of copulation, because their young is so small; the same argument may be held of the Flies, of which some are bigger than Bees, who lay lesse worms, the which growing by little and little become like Bees without wings, and afterwards become Flies.

Others

Others there are who think that Bees do spring from the Honey, or with the Honey, or at least of the most pure and excellent part of it: and that without all putrefaction. But yet something whatsoever it be, serving to engender, and out of which Bees are engendred, without doubt is layed in the cells.

Scaliger thinks they lay Eggs, although the Bee-masters, with one consent, say that they lay little Worms, not Eggs.

Taxites is of opinion, that they do couple, and determines the Bees to be the males, the Kings the females; and that the Kings at a certain time do put forth little Worms all about the Hives, as the Flyes do, and the Drones sit upon them as the Serpent useth to do, and by sitting upon them for such a time doth cherish them. Then afterwards these little Worms called in Greek *gasteres*, are fed with the purest, as it were with a mixture of wine and honey together, till at length they grow to be Nymphs, i. e. little Bees, but without wings; and then being wrapped up like to *Aurelia*, they lye still in the cells, neither taking any food or making any excrement. Till at length by such a day the shell wherein they lay being broken out come the Bees; and addresse themselves to their several employments, their wings being not yet fully grown. All this time the Bees are much delighted with urine, especially of men, and therefore do frequent those places which are wet with it; but especially after rain.

Conservation.

To the Conservation or keeping of Bees, many things are required, to wit, orderly diet, drink, sleep, watching, air, exercitation, habitation, convenience of place, as also moderation of minde, and physick fit to cure their Diseases; of which we shall speak in particular. As touching their provision, they seek for nothing, but they themselves being mindeful of the approaching winter, they take pains for in summer, and what they get store up accordingly. For they gather and cook or dresse their diet themselves, the prime or chief whereof is Honey, which being over nearly drawn from them, they become gaunt, and lank, and transparent, that you may see through their bodies, and unlesse there be other means made to sustain their hunger, they all dye for want of food. They have also other meat to preserve themselves withall, as Wan-wort, Honey-wort, Bees-meat called *Sandaracha*; but this is the worst, and tastes sweet like a fig: when these fail, the Bee-masters lay before their doors, figs, sugar, dried raisins, the drones bruised, the heads of gentles, wool wet in sod or sweet wine, and also honey-water, lest they should faint and dye for hunger.

Pliny would have raw flesh, if it be sweet and fresh, to be laid for them to feed upon. Generally all sweet things and of pleasant smell they covet, though at a great distance, not so much for the smells sake, but as being their natural food, as Flies feed upon wine. No odoriferous and fragrant flowers do they refuse; from whence they are in the Latine called *Florilega*, in the Greek, *ἀνθοφάγοι*, *ἀνθόφάγες*, from the delight they take in them, and their greedinesse in gathering them.

The Plants most acceptable to Bees, are the white and red Thyme, Melicor, the Myrtle, the Willow, the Broom, Lavander, Beans, wilde Thyme, Violets, Kexes, Rosemary, sweet Fleabane, Almonds, Heath, the Tamarisk, the Cytisus, Casia, Daffodil, Asphodil, but chiefly Balm: concerning which *Macer* sang these macilent verses:

*That herb the Greeks call Balm, the Bees approve,
And above other plants do highly love;
No flower or plant doth please them half so much.*

Also the Jvy, black Hellebore, Origanum, Savoury, wilde Violets, sweet Marjoram, the Hyacinth, the Palm-tree, the wilde Olive-tree, the Flower-de-luce, Saffron, Rose, Lilly, the Juniper-tree, Pear-tree, Peach-tree, Turpentine, Mastick, Cedar, Tiel-tree, the smaller Oak, goldylocks, wilde Saffron, Cumila, flowers of Mustard, French Spondilium, Crowfoot, purging Thorn, all trees that bear Mast, Apple-trees which have no bitterness in their blossoms: moreover they feed greedily on the flowers of dead Nettles both white and yellow, whereupon this herb by the Helvetians is called (*Bienfange*) as if you would say, sucked by Bees.

Drink.

As for their drink, if there be but a river or running water hard by in which there are stones, or pieces of wood cast (upon which they may light conveniently, and bath or wash themselves) they go no farther to drink, if there be none, they fetch their draught other where and quench their thirst, and when they have done, they carry of the same liquor to their King or Master-Bee, and to those that are at work within (as hath been said before).

Whatsoever they eat or drink, must be undefiled, pure, sweet, and without any stench or putrefaction whatsoever.

Yea, so cleanly do they live, that if a menstruous woman come near them; they are reported to forsake their food and feed no longer, as also those that use sweet oyls or perfumes about their bodies, and those that are given to overmuch lechery they hate above measure, and can by no means endure: also all things that smell of oyl or smoke, and dung and dirt, they are very shie of coming near, nor will they touch any thing that savours of any such matter. All hurtful herbs, all that have any bitter, purgative, unpleasant or poysonous quality in them; they forbear Wormwood, Rhubarb, Senna, Savin, Tithymals, Hellebore, Wood-laurel, Coccus gni-

dus,

dius, Thapsia, wilde Cucumers, Yew, Rhododendros, Wolfs-bane, they will not once taste of.

When they have laboured hard all the day, and come home weary, a certain signal or token being given, (as is above mentioned) they take their rest. The which oftentimes is many waies disturbed and hindred, and by this means the Swarm being astonished and over wak'd do die: sometimes the Gad-bee or Horse-fly molests them, sometimes the Bear making a noise wakes them, sometimes the approach of the enemy affrighteth them, *viz.* the Lizzard, Spider, or the land Toad; in which regard the Cornet presently sounds an alarm, and calls them all forth to arms in the night. If it happen to thunder or lighten by night, they are all presently in an uproar or tumult as if there should be a mutiny in the Arny, or some fatal battel to be fought. And the reason of it is in regard of the unwontednesse of the light at such a time, as also because they are afraid, and that not without cause, lest their Hives being shaken, the combs should be disordered and displaced, or their little waxen vessels being melted, the Honey should run out. That this is true by experience, no man can better speak then Dr. Penny and my self, who in the moneth of *August* 1586. whilst we sat up and watched by the Countesse of *Somerset* then a widow lying dangerously sick, together with her two noble Daughters *Mary* and *Elizabeth*, on a sudden (after a great clap of Thunder) under the next ceiling between the joynts, we heard a great noise, as it had been an alarm of war, and as we thought the floor did reound with the noise; being altogether ignorant of that (which indeed was the matter) that Bees did harbour between the rafters and the ceiling; where it seems they had remained for 30 years together, and every year to have yeelded two or three Swarms, as we understood afterwards by those which were eye witnesses of the same, and they of the chief Nobility, who affirmed it to be for certain. The next day for want of sleep they flew about making a hoarse noise, trembling, and not knowing what they did; they did touch those things which naturally they could not endure, they did dash themselves poor creatures against the windows, they did not spare to sting their friends and those that looked to them, even to the admiration of all that stood by and observed them. From whence we conclude without all doubt; that Bees are most patient of labour in the day time, but most impatient of being scared in the night, and of being disturbed of their rest.

From whence they seem to have gained the name or Epithet of *Soliferae*, or Sun-followers, for with it they rise, and with it they rest. None of them take so much as a wink of sleep all the day long, and all of them in the night sleep very soundly.

Now their exercise is of two sorts, either they fly abroad for their pleasure, or tarry at home and work for necessity. If that be denied them (the Crocodile, Swallow, Lizzard, Spider, or other strange Bees intercepting them) either by reason of intemperate weather, or long rain they become purtie, unwieldy and nummed in their limbs, grow into diseases, and shortly after die, especially in the summer season, which is the only time they have to exercise themselves abroad in the open air. When they have refreshed themselves with flying about, then they bath and wash themselves clean, and afterwards they lightly rub themselves smooth with leaves. Moreover also sometimes they carry little stones, sometimes they carry water, and as little things as they are, will break through the wind though it sit against them; and they will in a bravado, yea they will venture their very lives also to fight with the greatest of beasts; Horses, Elephants, Dogs, yea and Men too (*Archilochus* was of this opinion) if they offend them and quarrel with them they wound, and with their stings often and fiercely thrust into their bodies, they kill them. Sometimes they appoint duels one with another, not in earnest, but in jest, for exercise and recreation, not with any intent to hurt one another. They will play together oftentimes, and tickle one another, and like Doves bill and kisse each other, after which without doubt they couple together also, but at what time after, in what place, after what manner, let that all-eyed *Argustell*, who alone sits by the Elephants and knowes when they engender, which no man ever yet saw but God.

Now as they perform the aforesaid exercises of flying, of fencing, of carrying of stones, &c. for their recreation, so necessity the mistresse of Arts hath inured them to domestick labour, to which they diligently, not lazily apply themselves, no day (if the weather let not) is spent idly; but how long they work, that wholly depends upon the constitution of the Climate, or the air. For in cold Countreys from the setting of the Pleiades or seven-stars, to the Vernal or spring Equinoctial (or thereabout) they keep close within their Hives; but like Dormice without food, sleeping, and so they continue rouled up together like a ball, in a heap; nor do they stir a jot from the place where they are: for else how should such little creatures as they, be able to endure frost and snow, and the bleak gusts of the north wind? But if the temper of the year be more warm, and so continue for a great while together, 'tis longer ere they leave their work, and that *Aethiopia* proves by manifest experience, where through continual heat, and almost no cold that is there, the Bees work almost all the year long.

But in *Europe* they seldom go abroad before the beans begin to bloom or blossom, (as *Pliny* witnesseth) which they taste of the first of all flowers or herbs whatsoever. *Servius* dreams that when winter drawes on, they stop their mouths with juice and flowers, and with these keeping in their Hive to sustain themselves. But in summer they never loyter at all, but exercise themselves in constant employment; and when they have gotten such a numerous off-spring that one house

Exercise of
Bees.

house will not hold them, in the moneth of *May* they make a solemn expedition, and divide themselves into several Swarms hanging upon the boughs of trees like bunches of Grapes. The elder Bees afterwards making two or three rounds or circles in the air go to their food and return to their Hives: the young Imarm or colony thus sent forth and left, unless they be entertained with fresh Hives, wander up and down the woods, untill the publick overseers and hospitary Bees have found a fit place for the Swarm to settle in.

Now having spoken of their exercise, in the next place let us enter upon the description of the places or houses where they are to reside, which the Greeks call *κηφελαι, σμβλας, &c.* The Latines, *Alvus, Alveus, Alvearium, &c.*

Now about these for the conservation of the Bees, three things are requisite or needfull. The fashion or form, preparation, position, and the fitnessse of the place where they are to be set. The best receptacles for them, are made with barks, but especially with cork, which in the heat of Summer doth not scorch them, and in the Winter is very good to keep out the cold. The Ancients were wont to make them of an hollow tree, or of boards artificially joyned together, also they were used to be very handsomely made of Reeds, or of the Holm-tree wreathed or twisted together. Those of earth are counted the worst of all, as also those that are made of Brick, or Clay, because in Summer they are over hot, and in Winter as extreme cold. And yet (as I hear) in *Hungary* they have certain thick pots or vessels to hang up from the ground, and these they hang up in Trees, for the Bees to make their Combs in; which when they have done, they at a certain time take away again. Some make them of Mud or dirt, but these likewise have their inconveniences and discommodities.

The English use to enclose them in Hives artificially wrought and built of straw; that in Winter they should not be starved, nor in the Summer sweltered with heat. The Ancients were wont to make them of a kinde of transparent Stone, of Horn, and Glasie, to the intent that they might look in upon them and see how they wrought. But the Bees lay a first, second, and third covering over their work within (as I said before) whence they perceived they lost their cost and labour in that contrivance, as being never the near by that way to gain their purpose.

Let the form of the Hives be after the manner of an Egge, the yolk and the white being clean taken out, as when we eat it, a little of the end being pared off.

Moreover the Hives ought to consist of twelve rounds or wreaths of straw woven together after this manner.

The 3 first lowermost must be of one size or bignesse, a foot and a half in breadth: The 4 next above them are to be a little bigger and more capacious, that the combs may be the better fastened, and may hang more steady: The other 5 circles or rounds are to be narrowed and made steep up to the top by degrees, in the likenesse of a spire or pyramid; but the whole Hive ought to be of that content and bignesse that it may contain in it in all about 20 1/2 weight. Let the mouthes or passages into the Hives (by which the Bees are to go out and in) be about three or four; and no bigger than that the Bees when laden with Honey may well go in; for by this means, the Lizzard, or Beetle, venomous Spider, Moths, using to rob their Hives, are barred of their entrance; and the Hive will not be so obnoxious to frost, and the extremities of the winter season. Above these they use to make 4 doors, also windowes to shut down with bolts, 2 before, and 2 behinde, that they may the better take out the Combs, with lesse disturbance to the Bees in their making Honey.

The preparation or seasoning of the Hive after it is made, is reported to be divers. The English do take in new Swarms into new Hives, without perfuming or anointing them at all. The Ancients after they had made them very clean, did use to rub them all over within with Balm, Thyme, Fennel; and did sprinkle them with some sweet thing made of honey sugred, or with sweet wine or metheglin, that so they might the more willingly come into them, and the longer remain in them. *Palladius* was wont to anoint the insides of the Hive with the dung of the first calf that the Cow hath; and this he accounted for a chief secret to retain Bees in the Hive. Moreover it is requisite that about the midst of the Hive there should three or four sticks be laid a crosse to hold up the Combs; and then they are not subject with any light shaking of them to fall down; and are more easily if need be, taken away. Take heed also there be no chinks or chifts in them, whereby they may be annoyed with heat, cold, dust, vermine, the Cankerworm.

Placing of the Bees.

As for the Placing or setting of Bees, it is convenient that the Hives should be mounted on forms, or stools, that they be not dirty or mouldy with standing on the ground, and that they may live more secure from noxious and hurtful beasts. Let their standings be made of stones, chaulk, elm, or oak; three foot high, covered over with flat tiles, or pargeting, or whitelime, and that very smooth and sleek, that those Honey and Bee-devouring creatures may not be able to climb up. Let them also be set shelving or casting forwards, lest the rain-water settling upon them should soak and wooze into their Hives: for which cause (as *Columella* witnesseth) they were wont to be placed in hollowed walls or porches of Cities. Let there be two handfuls distance between every Hive, that one shogging or shaking, the next may stand unmoved, as it is usual when they are set close together.

Now as for their Ranks or rows how many they should be; they are not to be above three at

at the most; of which, let the younger Bees have the first, the second sort or middle aged, the middlemost, and the elder Bees, the highest or uppermost place. But yet both the Hives and the forms whereon they are set must be conveniently placed for the benefit and advantage of the Swarm; in hot Countreys, towards the North; in cold, towards the South; yea in *Ethiopia* by reason of the excessive heat, and scorching of the Sun, they keep them in their houses, a sufficient gap being made in the wall for them to go in and out at; lest their combs should be melted. Let the place where they are, be open, not over hot in Summer, nor very cold in Winter, quiet from wind, not woody, not inclosed with an over high wall or pale, nor against a place where any echo is given, planted with natural and ordinary food, remote from the company of men or cattel which may crop or shake off the dew from the flowers; near no jakes, privy-houses, dung-hills, common-shores, standing ponds, bogs, gallows or place of execution, Church-yards, or where bodies use to be buried; and so ordered that it may be in the bottome of a hill or in a valley, to the intent the Bees being laden may with greater ease fly down to their Hives. To conclude, if there be a wind above other that doth infect any countrey, in that, let the Hives be placed where they may suffer the least harm, and in no wise let them have any doors open against it. But this diet is necessary for the tame Bees for to maintain their lives; now as for the wilde and wood Bees, they live after another manner, they chuse their places of residence themselves, and furnish them accordingly. In the Countrey of the *Abissines* under *Prester John*, the Bees live in the Tradesmens houses, and flying up and down amongst them without fear, hang up their Combs, their hives being made fast to the beams or joyces of the same, without any harm at all to those that work in the place. Moreover in many places in *England* they have been known to have taken up their harbour of their own accord, and that for a long time together between the rafters and the ceiling of houses, and in the hollow trunks of trees, and from thence the old Bees have sent forth three or four swarms of young ones in one year. And (what is worthy to be noted) they live here longer and more happily, then in their artificial woven Hives, with so great diligence perfumed, so curiously set, ordered, digested and placed. But yet I commend their industry who have freed the Bees from this trouble, and have no lesse ingeniously built them houses to keep them from wind and weather. But they above all the rest deserve commendation who have found out how to cure the diseases of their bodies and mindes, inward and outward, and have had the skill how to apply them accordingly. The passions or distempers of their mindes with which they are most troubled, are Anger, Grief, and Fear. For they very hardly digest injuries, and they betray a great deal of choler and spleen to be in them, by their often fighting, even amongst themselves. For if they overabound with issue, they are all in an uproar about their cells and lodgings, nor can the quarrel be composed, till many are slain on either party; or being divided into faction, they do of their own accord seek other places of habitation. More then this, even the souldiers of the same Colony, when they (for some private grudge or jealousy fall into a rage) they make war, and fall foul one upon the other: the which the wary Bee-master espying, and casting in dust or cold water by squirts in at the vent holes, where they go in and out, or making a terrible and hoarse noise with the palms of his hands, doth before it be too late pacifie. For if he should let them fight on, they would be so mad and cruel one against the other, that they would never be quiet till they were all killed.

Sadnesse and Melancholy also doth very much distemper and disturb them, arising sometimes from the death of the King or Master Bee, sometimes of their young ones, sometimes of their keeper; neither will a day cease their conceived sorrow, but they take it to heart, that their bodies pine away, and it consumes them to skin and bone. Neither will the tinging or tinkling of the brasle pan, or any harmony, whatsoever delight them (which yet when they are mad, and dore so that they know not what they do, is wont to cure them) there is no plague or disease that can be named, that is more deadly to them than this.

They most stand in fear of the Spider, Lizzard, Crocodile, Toad, Glow-worm, Gad-bee, Wasp, Hornet, the multitude of Dors or Drones, a little bird called a Houp, the Tirmouse, Swallow, the Woodpecker or Ear-bee, the Owle, and other the like destroyers and spoilers of the Hives. They are likewise very fearful of an Echo, thunder and lightning, and the like sudden crackling noise; as on the contrary with a soft still whistling, or murmuring noise, and tinkling of brasle they are exceedingly taken and delighted. When fear takes hold on them, poor creatures, they wander up and down they know not whither, and when they go out or in to their Hives, they seem to be giddy, as if they had a Vertigo in their brains whirling and turning round; as for their Honey, or their young ones, or for those that are sick, they scarce regard them; and never leave trembling and quaking in their wings and shanks. The Bee-master therefore (when their provision fails) ought to destroy the Drones, and (by putting raw flesh into a pot) to take the Hornets, and then burn them. To kill the Frogs, Butterflies, Wood-worms, and Canker-worms, to wipe away their webs, to entrap the Gnats and Flies, to stab through the Lizzard, Crocodile, black fly or Beetle, and by putting in a Candle (to which they will come of their own accord) to burn the Glow-worms or Moths; to chase the Frogs and hunt them from the standing waters and fenny places, to throw down all the nests of Swallows, Modwals, Owls, or Wood-peckers (especially in all the neighbourhood or places hard by them) to destroy the Muskin or Tirmouse; and to defend them against all other beasts that lie in wait for them, and all other strange Swarms. In which fight

H h h h

Fear.

the Bees do as it were acknowledge their keeper, who after the victory issuing forth, set upon the vanquish'd troops, but to their defender or champion offer not the least harm.

The Bees by these means thus quitted of their fears, only with the tinkling of the Pan, and sometimes with the Bee-masters voice only, are strengthened and brought to themselves again, and every one cheerfully returns to his several appointed employment as before. Some Bees also are caught wandering up and down, and flying away from their Hives, for they take pleasure in wandering delights and embracements, and never care at all for coming home to their own habitations: this ill habit and haunt, the Bee-masters with clapping of their hands, and with the sound of the brasse (in which Bees are said extremely to delight) do presently remedy; although it is yet uncertain whether they do hear the sound, and are led by the pleasure of it; or whether or no rather being affrighted and terrified with the trembling and reverberation of the air (as when it thunders) they return to their Hives; and I see no reason why *Pliny* and *Niphus* should here make a doubt. Others lest the swarm should fly away and so be gone, do crop off half the wings of the King or Master-Bee. As also others do besmear or dawb the vent hole out of which they come, with the dung of a calf newly calved. Moreover if you strew their passages with the leaves of the Olive-tree boyled, they will not depart: also Wine sod with water is very good, but above all, the juyce of the herb Balm, wherewith (as it were with a kinde of philtre or love-potion) they are most powerfully retained, as the Poet *Macer* sings.

*Smear but their Hives with Balm and they'l abide,
And much the rather if that milk beside,
Be us'd to keep them, that they wander not.*

Pliny saith, if some of the dust over which the serpent hath gone, be cast upon the Bees, they will return to their Hives. Others yet advise to sow Goldilocks near where they are, as if they delighted most in that flower above all others, and would never forsake those places where these flowers abound. And Authors report that the wilde Bee is allured and tamed therewith.

The bodies of Bees likewise are subject to divers diseases, *viz.* repletion, inanition, drowth, moistnesse, cold, and unnatural heat. Repletion, or abounding of humours is caused when the Bee-master neglects to gather the Honey in good time; for then they do so fill and gorge themselves, till being grown over with scab and scurf, and swoln in their throats, they become sickly; there follows upon these sluggishnesse, feavers, longings, loathing of their food, watching or wakefulness; with which the miserable poor outworn Bees, unlesse they have some timely remedy, do die; wherefore of necessity they must have their Honey gathered from them. In doing of which two things are to be observed, *viz.* the time when, and the quantity how much, the which according to the quality and custom of Countreys, are divers. For in *England* they gather the Honey every year, *viz.* either in the latter end of *July* or in the beginning of *August*. In hotter Countreys they observe three times in the year to gather in this Honey harvest, *viz.* at the rising of the *Pleiades*, when their are at they Zenith or Vertical point, and presently after their setting. *Didymus* in his *Geoponicks*, writes that this time of the *Pleiades* is the best. The *Romans* did use to unbowel their Hives, the first time in the moneth of *May*, and then again when Summer was almost done, and thirdly about the Ides of *October*. From whence it was called Spring Honey, Summer Honey, Autumnal Honey, or Honey gathered in Autumn. *Aristotle* adviseth the first taking Honey, to be when the wilde Fig-tree begins to be green; the second he commends to be done about Autumn. Generally it is very necessary that the Honey should be taken when the Hives do overabound with Honey; the which is certainly understood by the shrill or squeaking noise that the Bees make. For if they be empty, they give out a more clear and loud sound, as being more full of air then meat: but most certainly it is known by looking in at those doors placed on both sides of the Hive, being open (saith *Columella*) of which we have made mention before in the building or structure of the Hives.

The manner of taking them is thus; Betimes in the morning while they are half asleep and drowfie, is the time when the work is to be affected, and their Combs taken away; it being not convenient to exasperate them in the heat of the day. *Columella* prescribes for this use two Iron instruments of a foot and an half long and somewhat longer; the one must be a long knife with a broad edge on both sides, but dull, with a crooked head and sharp teeth to rake out the Combs withall, the other plain with two sharp edges, to cut down the Combs. With these the vessel being opened, the businesse will very well be effected. In *England* as also in other Countreys, *viz.* in *Helvetia*, *Germany*, and the Low Countreys; they do not set upon them with these Iron instruments, but with fire, and smoak, and water, with which they chase the elder Bees from Hive to Hive and keep the Swarm entire at their pleasure.

Moreover in taking away the Combs, there ought a mean to be observed, according to the greatnesse of the Swarm and number of Bees. For with overmuch plenty of Honey they grow idle, and both defraud their Masters and themselves; for when the abound with Honey, they feed not on Bee-bread, but glut themselves with the very purest of the Honey: on the other side if there be not enough Honey left them to feed on, languishing for want of sustenance they grow heartlesse, and live carelesly; and becoming so thin that you may see through them, being starved and feeble, they miserably perish.

More-

Diseases of
Bees and the
cures,

Moreover, the old and rotten Combs ought to be taken away (but not those wherein posterity is concerned) and those which are whole, and which contain the young spawn or fry of the Bees, unlesse you see that there is not so much Honey left as may serve for the sustentation of the Parents or elder Bees. Keep such a proportion, that in the abundance of Honey, you take two parts and leave a third; if there be but indifferent store, take the half, if the Combs be in a manner empty, take nothing at all out of them. But this proportion is not to be observed in all places, because in regard of multitude of flowers, store of pasture, and goodnesse of it, together with the condition of the Countrey, you may take away more or lesse as you shall see cause. For in *Æthiopia*, *Syria*, and *Palestine*, they commonly take all the Honey out of Hives: which by reason of the fatnesse of the pasture, and continual dews, are filled again in very few daies.

But if there chance to be famine and scarcity, you must not only drein the Hives, but take away part of the Bees also; and choke the greater part of them, with the smoke of Tow, Reed, Turpentine, or Brimstone, or Galbanum, or else drown them in water; by which means the honey will become sweeter and purer.

Famine is caused especially two manner of waies; either by scarcity of provision, or the badnesse of it by reason of corruption: when there is great want you should supply them with Honey, sprinkle them with a liquor made of wine and honey boyled together, give grapes or figs bruised or pounded together, and sugar-sops. *Pliny* would have Hens flesh given to them, although he saith that Bees will not touch any flesh whatsoever. Now the corruption and un-soundnesse of this meat, doth procure first of all, longings, scowrings, barrennesse, and consumptions; from whence and by the stench of dung and dead corpses, ill savours, plague and putrefaction, with other dysasters do arise. In their longing desire of what they fancy, they grow so nice and peevish, that disliking all things, they are ready to fly away, unlesse with the perfume or vapour of things of a very pleasant and grateful odour, with exquisite playing upon the brass pipe, and exceeding neat handling of them, they be retained. Also they are taken with a lask or loosenesse in their bellies, both in regard of the naughtinesse of the juice it self, as also in regard they feed on those herbs and leaves that are purgative, as Hellebore, Spurge, both kinds of Elder. For being greeedy of food after their fasting all the Winter, as soon as the Spring comes, tasting more greedily, than in way to their health, every herb that they light on, without putting any difference, having gathered unwholsome honey, they are taken with a cacochymia, or ill humour or habit of body, and afterwards very suddenly fall into that lask or loosenesse, afore spoken of.

Against this disease (saith *Pliny*) set them services with honey, or wet with man or oxen piss. Also Pomegranat kernels moistened with wine of wilde Briony; *Palladius* much commends the kernels of Pomegranates or Raisins boyled and pilled, with Manna or sharp wine set before them in wooden gutters; also he bids squirt in Honey boyled in water, with the powder of Galls, dried Roses, or Rosemary, or set it in with little sawcers.

Moreover, care is to be had, that they do not bring home any food gathered in the woods, where for the most part do grow harsh and sowre herbs, with the acrimony thereof the bellies of the Bees are moved, and are scarce stayed but by the experience and accurate endeavour of their keeper. From thence proceeds barrennesse, because by that means for want of seed they do not generate, or at least (by reason of feeblenesse) they are not able to hatch their young, or constantly to sit upon them, or to avoid the snares of the Spiders which are drawn over the mouthes of their cells. This consumption and hestickfeaver increasing yet more and more, *Higinius* bids that flowers be brought, soaked in dew or a sweet liquor made of wine and honey, and so layed unto the holes or vents of the Hive. Also he commends for that purpose Violets and Buglosse, flowers besprinkled with new wine boyled half away, after that their Hives being very well cleansed, and the vermine and dead Bees rid out of them, they are to be perfumed with oxen or calves dung; because that takes away putrefaction and infection, and doth infill a new life or soul (if *Columella* say true) into the almost expiring Bees. They are also full of lice (as *Florentius* relates) the which he cures with the shavings of the Pomegranate and wilde Fig-tree burnt to ashes. The same Authors cure the dulnesse or purblindnesse of their eyes with the powder of wilde Marjoram. They themselves are able to take away their scurf and dandrif, with a gentle rubbing of their bodies against the herb Celandine, and against walls stained with urine; their drinesse they cure with baths, and their throat with drinking mineral waters.

The diseases that come of moisture, are swellings in the neck, tumors in the head, dropsies, which the Ancients used to cure with dry herbs, and shaking off the dew from them betimes in the mornings, and our countrey people do somewhat abate it, by keeping them from common water, for they keep them three daies together in their Hives, by which it comes to passe that not only the superfluity of the bad humour is dried up, but the natural moisture is in some measure regained. *Hesychius* writes of a disease very common to Bees, which he calls *Karev*, but what it is he doth not tell us, neither could I learn from any other Author, what, or what manner of disease it should be.

The diseases proceeding of cold are congelation, nummednesse, stiffness, and other of that sort, for you shall see them sometime so nummed and stiffe with cold, that you would not think they had the least motion, much lesse breath. On the other side, through extremity of heat, they

are driven into madnesse, excesse of thirst, Feavers, Vertigo, and swimming in their heads, yea they grow stark mad, at which time they know no man, no nor their keepers, and will strike their friends with somewhat venomed stings. In such sort therefore ought their Hives to be placed in both seasons of the year, that in the winter they be not too much oppressed with cold; and in the summer, that the shade of the trees do not keep the heat from them. Bees do fail also sometimes for want of issue, as in the plenty of pasture it happens to come to passe, at which time they are so intent upon their work in making of Honey, that the care of copulation and propagation is quite laid aside; and so the reparation of issue being omitted, the whole Swarm being spent with labour, is extinguished. But when they fly away in stomach and anger, by reason of their Hives being not kept sweet, or for some peltilent disease that reigns amongst them; you must follow after them, and with that Art (*Palladius* hath taught) being found again, entertain them in clean Hives, and remove them from the place where they were before into fresh dwellings. Moreover, *Pliny* saith it doth very much conduce to the keeping of Bees, that they be lawfully and honestly come by, that is, that they are either given or bought, for if they be stoln they seldome thrive, and come to good; as it is with Rue or Herb of Grace, if stoln it very hardly growes.

Now if when we shall have removed from Bees all creatures that annoy them, what we shall yet further adde to the conservation of their health, and the cure of their diseases, I do not see. First, therefore remove from them all filthy Lechers, menstruous persons, those that have the running of the reins, baths, smoke, dunghills, laystals, all those that smell of grease or kitchenstufte, or having nothing else to do, or on purpose to offend them, stand before their Hives mouth. The air being infected with the breath of Toads or Serpents, purge with Balm, Gentle, Thyme, or Fennel burned. See that they live neatly and daintily; kill all predatory or devouring vermine; and the signs or symptomes of their diseases being perceived and known, apply the cure of them. Now the signs of Bees, as of other creatures also, being not well, are gathered from three things, that is to say, from their refraining to be in action, from the external garb of their bodies, and from their excrements. For the losse of mirth, lumpish melancholy, vertiginous or whirling gate or motion, their frequent and lazie standing at the door, their fainting in their work, their disdain of flowers and honey, their more then ordinary either sleeping or waking, unwonted hummings, are an argument that the Bees are ill at ease. As also when their bodies are unhandsome, not trim, rough, not sleek or smooth, scurfie or scald, not shining or glistering, lean and transparent, not well liking, or well fed. Moreover, if their combs have an ill favour, or if their dung or ordure turn to water, or be full of worms, and when they carry out every day their dead, not at all regarding their Hives, these are infallible signs of sicknesse, and some epidemical disease that reigns amongst them, some part of which *Virgil* in 4. *Geo.* hath elegantly, though somewhat confusedly touched in these verses following.

If Bees be sick (for all that live must dye)
That may be known by signs most certainly.
Their body is discoloured, and their face
Looks wan, which shewes that death comes on apace.
They carry forth their dead, and do lament:

Hanging by th' door, or in their hives are pent.
Hunger and cold consumes them, you shall find
They buz as doth 'ith woods the Southern winds,
Or doth the sea when that the waves return,
Or fire clos'd up in vaults with noise doth burn.

And thus their distempers being understood and cured, they live to extreme age; which *Aristotle*, *Theophrastus*, *Pliny*, *Virgil*, *Varro*, *Columella*, *Cardan*, and all Authors whatsoever, do conclude not to extend it self to nine years. Although I saw it by experience, and with no lesse delight to be otherwise at *Hannorth* in the Countesse of *Somerset* Bees (before spoken of) (there are yet present witnesses, who are worthy of belief which will attest it) that there they have lived in the same place above the space of thirty years; and almost four times a year, have made out fresh flights or swarms of young ones. Which reason doth induce me to believe, that Bees in their own natural constitution are long lived, and I do with *Albertus* alone make a question, whether they may not live so long till they dye of old age. Well I know they may be taken away by diseases or incursion of their enemies; but if they had alwaies all those necessities for their life and health by them, and those things which should be destructive kept from them, I should easily grant that they would live to a very exceeding great age, if I did not altogether say they were immortal. For they alone, of all other creatures, are fed with Honey that immortal Nectar, dropt down from heaven, and with that divine dew (which is the soul and spirit of all herbs, trees, and plants) gathered together into one body or masse; of whose nature, use, and excellent vertue, we shall speak in the following Chapter.

CHAP. IV.

Of the use of Bees.

WHereas the most high God did create all other creatures for our use; so especially the Bees, not only that as mistresses they might hold forth to us a pattern of Politick and Oeconomick vertues, and inform our understanding; but that they might be able as extraordinary foretellers, to foreshew the success and event of things to come; for in the years 90, 98, 113, 208. before the birth of Christ, when as mighty huge Swarms of Bees did settle in the chief Market-place, and in the Beast-market upon private Citizens houses, and on the Temple of Mars, there were at that time stratagems of enemies against Rome, wherewith the whole State was like to be surprised and destroyed. In the reign of Severus, the Bees made Combes in his military Ensigns, and especially in the camp of Niger. Divers wars upon this ensued between both the parties of Severus and Niger, and battels of doubtful event, while at length the Severian faction prevailed. The Statues also of Antonius Pius placed here and there all over Hetruria, were all covered with swarms of Bees; and after that settled in the Camp of Cassius; what great commotions after followed Julius Capitolinus relates in his History. At what time also through the treachery of the Germans in Germany, there was a mighty slaughter and overthrow of the Romans. P. Fabius, and Q. Elius being Consuls in the camp of Drusus in the tent of Hostilius Rutilus, a Swarm of Bees is reported to have fate so thick, that they covered the rope and the spear that held up the Tent. M. Lepidus, and Minus. Plancus being Consuls, as also in the Consulship of L. Paulus, and C. Metellus Swarms of Bees flying to Rome (as the Augurs very well conjectured) did foretell the near approach of the enemy. Pompey likewise making war against Caesar, when he had called his allies together, he set his Army in order as he went out of Dyrrachium, Bees met him and fate so thick upon his Ensigns that they could not be seen what they were. Philistus and Elian relate, that while Dionysius the Tyrant did in vain spur his horse that stuck in the mire, and there at length left him, the horse quitting himself by his own strength, did follow after his Master the same way he went with a Swarm of Bees sticking on his mane; intimating by that prodigy that tyrannical government which Dionysius affected over the Countrey of the Galeota. In the Helvetian History we read, that in the the year 1385, when Leopoldus of Austria, began to march towards Sempachum with his Army, a Swarm of Bees flew to the Town and there fate upon the tyles; whereby the common people rightly foretold that some forain force was marching towards them. So Virgil in 7. *Æneid*.

*The Bees flew buzzing through the liquid air;
And pitcht upon the top o' th' Laurel tree;
When the Soothsayers saw this sight full rare,
They did foretell th' approach of th' enemy.*

That which Herodotus, Pausanias, Dio Cassius, Plutarch, Julius Caesar, Julius Capitolinus, and other Historians with greater observation then reason have confirmed. Saon Acrephniensis, when he could by no means finde the Oracle Trophonius; Pausanias in his Boeticks saith he was led thither by a Swarm of Bees. Moreover, Plutarch, Pausanias, Elian, Alex. Alexandrinus, Theocritus and Textor are Authors that Jupiter Meliteus, Hiero of Syracuse, Plato, Pindar, Apinus Comatus, Xenophon, and last of all Ambrose, when their nurses were absent, had Honey dropt into their mouthes by Bees, and so were preserved. Xenophon also in his Oeconomicks calls making of Honey, the shop of Vertue, and to it would have matrons and mothers of families go to be instructed. The Poets willingly yeeld themselves to be compared with Bees, who following nature as their only Mistress, use no Art at all. And so Plato affirms that Poets were never able by Art to finish any master-piece. Insomuch that Pindar doth vaunt himself in this to be superior, or to go beyond Bacchilides and Simonides, in that he was taught by nature not by Art. Bees unless provoked are harmlesse, but being vext they will sting and that most shrewdly. Such is the condition of Poets: from whence are occasioned these verses of Archilochus,

*He that doth move me, quickly finds my sting;
I'll make him cry, and through the City ring.*

Wherefore Plato in his Minos gives it as a rule to those that desire peace and quiet, that they be very well advised how they intermeddle with Poets and Bees. To conclude, so many are their vertues worthy our imitation; that the Egyptians, Greeks, and Chaldeans took divers Hieroglyphicks from them; as when they would expresse subjects obedient to their Prince, they set it forth in figure of a Bee very singular in that vertue; when a King loving to his subjects, they portray it likewise and set it forth by a Swarm of Bees. Other the like emblemes are to be found in Pierins Hieroglyphicks worth the labour of searching for. From them the Countrey people learned their skill of prognostication of the weather. For they perceive wind or rain before

it comes, and foretells storms and showres that are at hand; when they are ready to come, they are sure not to fly far from their Hives, but will feed themselves with their own moisture. All those things being as they are, 'tis no wonder that *Aristeus*, *Philistrus*, *Aristomachus*, *Solenis*, *Menus Samnites*, and six hundred others that have wrote of Bees, have left the pleasures and delights of the City, and for 58 years to have lived in the woods, that they might be the more perfectly acquainted with their conditions and manner of life, and be the better enabled to commend them for an example to posterity. Neither was *Virgil* the worse for being so well seen in their History, the which he hath most elegantly set down in the fourth of his *Georgicks*.

But what their bodies and their labours do work upon our bodies, it is now worth the pains to relate; whereby we may assuredly know, that there is nothing in Bees but what doth serve for our health and welfare. For,

Their use in
Medicine.

First of all, their bodies as soon as they as they are taken out of the Hive, and pounded and drank with some diuretick, or wine and milk; do strongly cure the dropie, dissolve the stone or gravel, open all the passages of the urine, cure the stopping of the bladder. Bees that die in the honey, cure impostumes, and help the dullness of sight or hearing. Also being pounded together, they cure the griping or winking of the belly or guts, being applied to them. If poysoned honey be drank, they themselves being drank down after it, do expell it: they soften hard ulcers in the lips; being bound to a carbuncle or running sore, they heal it; they cure the bloody flux. Honey being strained with them, helps the crudities of the stomach, or specks or red pimples in the face, as you may see in *Hollerius*, *Alexander Bened.* and especially in *Pliny*. Take Bees dead in the combs, and when they are through dry make them into powder, as *Galen* in *Euporist.* writes, mingle them with the Honey in which they died, and annoint the parts of the head that are bald and thin haired, and you shall see them grow again. *Pliny* in like manner teaches to burn a great company of Bees together, and mingle the ashes with oyl, and anoint the part; only with this caution, that the adjacent parts be not touched therewith; yea, Honey scraped of Bees that are dead, he affirms to be very sovereign in all diseases, and very useful. *Erasis* in his 61. chap. de *Morb. mulieb.* tells us that their Ashes beaten with oyl is good to make the hair white.

Moreover, Bees are very profitable and useful in regard they serve for food to other creatures; as to the Bear, Lizzard, Frog, Serpents, Spiders, Wasps, Swallows, Houps, Robin-red-breast, Titmouse or Muskin; as *Belonius* hath observed.

Palladius saith, that some men are wont to take great delight in hunting after them; and he tells you how you shall finde them out in these words. In the month of *April*, in sunny places, if the Bees do frequently resort thither, either for food or water, then certain it is, that their nest or Honey-shop is not far off, but if there come thither but a few in a company, then 'tis a sign that they harbour farther off. But when they come very thick, by this trick you shall finde out their Swarms, take a little wet Oaker and mark them on the back, and there remain, while those that were mark'd return back thither again, if they make a speedy return, then they make their abode not far off; but if they tarry more then ordinary, then they reside farther off. Now by this means those that are hard by may easily be found out; but to come at them that are more remote and farther off, do thus; take a piece of a Cane and cut it off at either end at the joint, and make a hole in the midst of it; there put in a little honey, or sweet wine boyled half away, and lay it by the side of the fountain or water where they resort: when the Bees come thither, and are drawn in by the sent of the honey, hold your thumb close upon the hole, and suffer but one Bee to go out at once, follow that as far as you can well discern him, when that is out of sight let go another, and by this conduct at length you will easily finde the place where the Swarm is. If it be in some hole or cavern of the earth; make but a smoke upon the mouth of it, and all the swarm will hurry out, and when they come forth, being a little scared, with the tinkling of a brass pan, they will hang themselves upon a little bough as it were a bunch of grapes, from whence having a vessel to put them in, you may take them away. If they chance to make their nest in the arm of a tree, then take a sharp saw and saw off the bough above and below them, and cover the middle part where they are, with a clean cover, then carry them where you please, and put them in a Hive.

By this Art you may finde their Swarms where they use in woods, dens, or hollow places, stony or craggy rocks, or any place whatsoever: only see that you begin your sport betime in the morning, lest the night overtake you, and you lose your game. Neither only are they delightful sport to them that hunt them in the day time; but also (if *Fabritius* and *Artemidorus* do not deceive us) if a man light upon them in his dream when he is a sleep; if he be a poor man, it foretells he shall be rich; if a King or a great man, that his subjects, or those that are under him will be loving and obedient. But he that dreams he had a stock of Bees, but in present hath them not, 'tis a sign of a decaying estate, and of some imminent approaching disaster to befall. Of so great use are Bees: and so variously hath dame Nature the contriver of all things, sported herself, or rather taken great pains indeed in furnishing them with such rare qualities of all sorts, as wherewith you have heard them to be endowed.

But to what purpose is (will you say) that sting, against whose poyson and venom *Pliny* himself knew no remedy? I confess, and experience teacheth as much, that Bees stings are some times

times venomous; but it is only of those Bees which are raving mad, or burning with some fever, anger, or hunger. Otherwise they do little or no harm at all, and therefore *Diocorides* did not deign so much as to mention the symptoms of the stinging of Bees, supposing it a childish simple thing for any man to much as to complain of the sting of a poor little Bee: later writers observe that the sting is accompanied with redness and tumor, especially if the sting do yet stick fast in the flesh, which if it go in very deep sometimes proves mortal, as *Nicander* writes in his *Theriaca*. The Ancients (that we may prove the sting of Bees to be converted to some good use) as *Suidas* reports, were wont to punish cheaters with them on this manner: They strip the malefactor stark naked, and besmeared his body all over with Honey, which done, and his hands and feet being bound, they exposed him to the heat of the scorching Sun, that what with the piercing rays beating upon his body, what with the stinging of the Bees and flies, and their often stabbing and wounding him, he did at length suffer a death answerable to his life. But if you would indeed resolve to go sting-free, or at least heal yourself being stung; expell out of your minde, idleness, impiety, theft, malice: for those that are deild with those vices, they set upon to chuse as it were, and out of natural instinct. Beware also in especial manner, you wear not red garments, which might represent you to them, to be a murderer or man of blood; as also that you be not taken by them for an unchaste or unclean person, which it seems they naturally know and abominate (as hath been said before) They which carry the bill of a Wood-pecker in their hands when they come near them, although they do somewhat disturb their Swarms, yet (as *Pliny* saith) the Bees will not hurt them. *Nonnius* reports, that if you rub and beat to powder the herb called Balm-mint, or Balm-gentle, their stings will not be able to hurt you. *Florentius* gives in charge, that he that is to gather the honey should annoint himself with the oyl or juice of Marshmallows, whereby he may take away the combs without danger. But the juice of any Mallows whatsoever will do the like; and the better if they be rubbed with oyl; for it doth both preserve from stinging, and is a remedy to those that are stung. But be it granted that diseases be contracted by their stings; yet tis but taking a few of these Bees that are found dead in the Honey, and let them be carefully applied, and they presently cure them; and take away all the venome and aking of them.

What shall I say? God never created a creature lesse chargeable, and more profitable. They are bought for a very little money, they will live in all places whatsoever, even in woody and mountainous Countreys. The poor as well as the rich gain a great return or revenue by keeping of them, and yet need they not put more in the pot, or keep a servant the more for them. *Merrula* reports that *Varro* rented out his stocks of Bees, for 5000 *l.* of Honey; and in *Spain* out of a little Village containing not above an Acre at most, that he gained of the Honey there gathered 10000 *Sesterces*, i. e. 50 *l.* of our English money in one year. Besides all this, we have from their shops or store-houses, Wax, Bee-bread, Bee-glew, Rosin, Honey-combs such as no Common wealth can well be without; not to repeat their virtues, which are no less wholesome for the minde, then those are profitable for the body and maintenance of life. And first of all we will treat of Honey, that immortal, nectareal, pleasant, wholesome juice, and principal of all works and operations.

CHAP. V.

Of the Name, Difference and Use of Honey.

AT the first Honey had but one name, called in the Hebrew *Dabesch*; but since that strange and confused Polyglottology, or speaking with divers tongues it was called of the inhabitants of *Arabia*, *Hel*, *Han*; of the French, *Miel*; of the Italians, *Mele*; of the Dutch, *Honich-zeem*; of the Germans, *Honig*; of the English, *Honey*: the Greeks called it, *uui*, from the admirable care and industry of the Bee in making of it, as *Eustachius* notes: from whence comes *μελισσιον*, *Melissellum*, of *uui*, in *Porphiry*. This for the Name: But what it is yet after all is much controverted amongst the learned. Some there are that fondly conceit it to be the spittle of the Planets, or the gelly falling from the Stars; others, the purging of the Air, or the sweat of the Heavens; but in my judgement it may more properly be termed the *Chylus* of the Bees, gathered from some sweet matter, but having its perfection and consummation from their ventricles; and afterwards by exuption or vomit cast out into the cells or Honey-combs. *Aristotle*, *Pliny*, *Aelian*, *Seneca*, would have the Bees not be makers of the Honey, but only gatherers of it: for thus they write: The Bees, (say they) do gather the Honey from the dew of the air, especially at the rising of certain Stars, and from the conjunction of the Rain-bow; for they make no Honey, but Honey-combs only. *Galen* also lib. 3. de *Alim. fac.* hath these words: I remember (saith he) upon a time, in Summer we gathered a great quantity of Honey from the leaves of the trees, and then the Countrey in way of sport sang, *Jupiter* rains Honey. But then the night before had been exceeding cold, as it could be in Summer, by the strength whereof the sweet exhalations, and vapours being drawn up by the Sun were congealed together. Now with us this is a very rare accident; but in Mount *Libanus* it happens every year: and therefore they spread skins upon the ground

ground under the trees, and shake them, and the Aerial Honey that falls from them, they put up in pots, and earthen vessels. Now Honey, as all other things, do differ in substance or matter, it is either Aerial or Terrestrial; Aerial Honey is one thing, Terrestrial another: For in the moneths of *May, June, and July*, a kinde of heavenly Ambrosia falls down upon the leaves of plants (which they call honey dew, but I rather mieldew) very sweet in taste, liquid, pure, and as sweet as sugar it self; this being gathered and drank in, the Bees I grant do ripen or bring to maturity, but that they make any real mutation, I constantly deny; unless perchance you will say that the refining the dew, is an alteration of the species. *Gal. lib. 3. de Alim. fac.* affirms that the matter of Honey is not the very dew it self, but something near of kin to it: the which Bees gathering do cast up again into their cells, but they do not change the species of the juice; as *Avicen* also saith. But this aerial dew, of which this aerial Honey is gathered is of two sorts; coagulated or thickened Manna; and liquid, of which the best Honey is made; especially if it retain the same vertue it had when it first fell: but falling from such a height, and even with the very sliding of the fall by reason of the impurity of the air contracting delement, and being infected with the exhalation of the leaves, and juice of the flowers upon which it lights, it looseth much of that heavenly vertue, although some remain, and being so often shifted in the ventricles of the Bees, cells, honey-combs, it hath some strange qualities joyned to it. But in the beginning, Honey is like pure rock-water; and in the first daies it boyls like new wine, in the 20. day it waxeth thick, a while after it is covered over as it were with a thin film or membrane, which with the froth of the heat of it, congeals together. Terrestrial or earthy Honey we call that, because the dew going away, it is sucked out of the very sweat of the earth, and the sweeter part of the plant, of a thick substance indeed, and a quality answerable to that from whence it was extracted. And from thence it takes the name of Grasse-honey, Bean-honey, Lilly-honey, Violet-honey, &c. respect being had to those things from which it is collected or gathered. But that Honey is best for substance, which is of a fat oily consistence, partaking of both, which doth of its own accord run out of the combs, (in Greek called *ἀκρόσφορ*; or rather *ἀνεσφορ*) and doth not abound with dregs, and is quickly boyled, and doth cast up very little or no scum; and alwaies so tenaciously sticking together, that if you lift it up a good height on the top of you finger, it falls to the earth still homogeneous, unsevered, no way parted asunder, but remains in one continued flake, or line. And to conclude, that which if fire be put to it, will soonest arise in flame. Unless there be all these properties or most of them in your Honey, you shall discern the substance not of good Honey indeed, but of base, adulterate, impure trash.

The best Honey how known.

Accidental properties of Honey.

The Accidents or accidental properties of honey, are likewise some good, some bad, both of them are taken from the season, place, quality. If you respect the time or season, the newer the honey the better it is accounted, and the Spring or Summer honey far beyond that is gathered in Autumn. The first of these is gathered from flowers only, and those very tender and newly budded (thence called *Anthinum*, or Flower-honey). The second is collected of nothing but herbs, and ripe flowers, thence called *ἀνέσφορ*, or Summer honey. The third, last and worst, is had after the first Autumnal showres, and that very sandy or gritty and woody, gathered only of Heath or Ivie (which are then the only things green that are left) and from thence is called *Ericaun*, Heath-honey or Ivie-honey: all which (as I said before) have their greatest commendation from their freshness or newness, because with long keeping and concocting, they wax bitter; from whence the Proverb, He that will make a good mixture of wine and honey, must mingle with new Hymettian Honey, old Falernian Wine. It is also better or worse in regard of the place whether proper or common. If you respect the proper place, or the vessel wherein it is contained; the best honey is still found in the bottome, for the dross which is contracted either by soyl of herbs, or by the air while it falls from so high a place, is cast up to the top as froth; and in the bottome it is found to be more glutinous, ponderous, luscious, and better compacted.

In what countreys the best Honey is to be found.

If you would attend the common place or region wherein it is gathered; according to the nature of the Countrey, so is the value of it.

In the first place and above all other, the *Attick, Athenian, Hymetick*, especially, when made in the silver Mines, hath been hitherto adjudged the best honey, both in regard of the excellent nature of the Bees themselves, as also for that those Countreys do abound with Thyme and other choice plants and herbs, and likewise in regard of the goodnesse of the place where the combs are made. *Dioscorides* gives the next place, to the Islands of the *Cyclades*, or the *Aegean* Islands (which is very luscious and pleasant, and welnigh as good as the *Attick*) And the third and last place to the *Hyblean*, and *Sicilian*.

Johan. Bauhinus a very learned Physician, and surpassingly well seen in the knowledge of simples, saith that he saw of this *Attick* honey in *Verona* in an Apothecaries shop, which he found put up in the bladder of an Elephant, very thick, and weighing 21. pounds, of the length of two cubits, of the breadth of a cubit and a half. I suppose it was brought thither out of *Africk*, for how should an Elephants bladder be had in *Athens*? In the judgement of *Cardanus*, that honey which comes from *Cephalenia*, an Island in the *Ionian* sea is the best; next to that in *Europe*, is the *Spanish*, and that not without reason; in regard the dew for the most part in those hotter regions is better concocted: and (in all Countreys) where the purest air is, there is the virgin Honey (*i. e.*) pure pale, and is made up as it is, having no need of fire to purge it. The *Taren-*

fine honey is also commended, as *Strabo* reports. About *Tagodast*, *Melelas*, *Hea*, *Hascoria*, the iron Mountain *Rhahona*, *Echebdebona*: *Jo. Leo* saith there is very excellent African honey made. *Ludovicus Cadomus* prefers the honey of *Sinegen*, *Andreas Corsalius* the Mombaren, *Edorades Barbosa* the Ethiopick, *Thomas Lopius* the Cathaian, *Franciscus Alvares* the Tigrémahonensian, *Sebastianus Baro* the Samogitick, *Enricus* the Lituanian, *Erasmus Stella* the Russian, *Thevet* the American, *P. Iovius* is exceeding much in the commendation of *Moscovy* honey; but not so advisedly, in as much as our Merchants, and *Sebast. Baro* a very impartial writer of those things which are seen and done there, do very seriously affirm that in all the Dukedom of *Mosco*, there are neither Bees nor honey. *Albert. Campensis* in his history of *Myfia* which is called *Britus*, saith that even in the *Hercinian* woods, there is extraordinary good honey to be found, and that altogether as good as the *Cecropian* or *Attick* honey may be. *Alianus* affirms that in snowy and icy *Scythia*, there is Countrey honey very praise-worthy; and that it is carried to *Myfia* (where it is sold at a very dear rate). But if the heat of the Countrey doth add to the honey pureness and goodness, how is it possible such excellent honey should be had in *Scythia*, and *Samogithia*? Is it because the flowers there growing and receiving the dew are better then in other places, and by that means cause it to be clearer and purer? Or is it because of the North winds which are most frequent in those parts, which do purge the air? Or is it because as well Bees as men there are of more strong constitutions, and therefore are better able and do take more pains to refine and work the honey in their ventricles? which is the more likely, seeing they were not able to live at all in that cold region, nor could not arrive at such an Age (for there they live very long) if they were not very healthy and lusty of body.

Now whereas *Cardan* denies that there is any exquisite honey made in moist Countreys: let *England* and *Ireland* challenge him for their right; which being obnoxious to showres and very much rain, a thing fatal to Islands, do yeeld such extraordinary pure honey, that it hath not the least mixture of venome, and doth last a long time before it be corrupted or putrified; that we do not speak of its excellent whiteness, hardness, sweetness, hanging well together, viscosity and ponderousness; and other principal signs of the goodness of it; but let us leave off to commend our own Countrey wherein good is to be found; and set forth those Countreys which are infamous for the badness of it. For the extreme bitterness the *Cholchian* honey, and next the *Corsican*, and in some places the *Hungarian*, and the *Sardinian* hath an ill name. For in *Sardinia* Wormwood, What Countrey produces bad honey. in *Corsica* Rose-lawrel, in *Colchia* the venomous Yew, and all of them in *Hungary*. Also the honey is venomous in *Heraclea* of *Pontus*, and in the flowers of Goats-bane fading with the wetness of the spring; for then the flowers contract that hurtfull venome; which doth presently infect the honey-dew that falls upon them. There is also another kinde of pernicious honey made, which from the madriels that it causeth, is termed Mad-honey; which *Pliny* conceiveth to be contracted from the flower of a certain shrub, very frequently growing there in the woods. *Dioscorides* and *Actius* do not amiss impure this poyson to be caused of great plenty of the venomous herb called Libbardsbane, or Wolf-wort which groweth there; in that it is cured with the very same remedies as the venome of that herb is. In *Carina*, *Persis*, *Mauritania* and *Getulia*, bordering to *Masseulia*, either by reason of vapours of the earth, or by reason of the virulent and poysonous juce of the plants, poysoned honey-combs are produced; but are descried by their duskie or blackish colour. In *Trapezuntum* in the Countrey of *Pontus*, *Pliny* reports of a certain honey that is gathered of the flowers of the Box-tree, which as it doth make those that are well sick with the noysome smell of it, so those that are not well it restores to health. On the trees of the *Heptocometanes*, a people near unto *Cholchia*, there growes a kinde of infectious honey. The which poyson being drank makes men stupid, and out of their wits. This was sent by the enemy to the three Legions of *Pompey* with a token for the desire of peace, they drinking very freely of it, were put both besides their wits, and their lives too (as *Strabo* saith). *Ovid* makes mention of the *Corsick* honey very infamous, being extracted from the flower of *Hemlock*, speaking thus:

*I think it's Corsick Honey, and the Bee
From the cold Hemlocks flowers gathered thee.*

But yet it may seem to be not so much for Dame Natures honour, that she should bring forth a thing so desired of all men, as honey is, and so ordinarly to temper it with poyson. Nay but in so doing she did not amiss, so to permit it to be; that thereby she might make men more cautious and lesse greedy, and to excite them not only to use that which should be wholesome, but to seek out for Antidotes against the unwholesomeness of it. And for that cause she hath hedged the Rose about with prickles; given the Bees a sting, hath infected the Sage with Toad-spittle; mixed poyson (and that very deadly too) with Honey, Sugar, and Manna.

The signs of poysoned honey are these, it stains the honey-comb with a kinde of Lead-colour, The signs of poysoned Honey, and the remedies against it. doth not become thick, it looks of a bright shining glistering hew, sharp or bitter in taste, and hath a strange and uncouth smell; it is far more ponderous, then the other, as soon as it is taken it causeth needling, and a looseness of the belly, accompanied with excess of sweating. They which have drunk it do tumble themselves up and down upon the cold earth, very desirous of refrigeration. The *Heracleian* poyson'd honey hath the same symptomes with the poyson of Wolfs-bane, and

and hath the same way of cure. *Galen* reports that two Physicians in *Rome* tasted but a very small quantity of poysoned honey, and fell down dead in the open Market-place.

Against madness from eating honey, *Dioscorides* prescribes Rue to be eaten, and salt fish, and honey and water to be drank, but being taken they must be vomited up again; and he prescribes the same remedie against this disease, as he doth against Wolfs-bane, and Rose-lawrel: and *Pliny* agrees with him; also he adds one singular antidote, to eat a fish called a Gilt-head, which also wonderfully corrects the loathing of good honey. *Gulielmus Placentia* bids to cause vomit abundantly, with syrup of Violets, acetosus simplex, and warm water, eating salt fish before vomiting. Afterwards he gives Theriac with hot vinegar. *Christophanus de honestis* perswades vomiting, and to set cold water under the nostrils, with the flowers of Violets, Water-lillies, and Fleawort. But his Bezoar stone, are Quince kernels bruised, and given with hot water, as *Sanctus Ardoinas* relates. *Avicenna* hath prescribed nothing worth speaking of, but what he had from others: for I understand not what he means by his *Animeli*.

But what if I a youth and an English man, after so many grave and experienced Physicians should asserit this for a certain Antidote, viz. to take nothing down but the Bees themselves. The likelihood of the conjecture doth perswade, and reason it self doth somewhat seem to favour it: For unless that Dame Nature had given to these Bees, a very marvellous power against poysoned honey (as amongst men to the Philli against Serpents, to Storks and Peacocks amongst the Birds) without all doubt with gathering of it, swallowing of it, and for some time keeping of it in their bodies, yea concocting of it there, they would be grievously pained, and the poyson running and dispersing it self through all the parts would kill them.

Now the Terrestrial honey, although it be not alwaies poysonous, yet by reason of the blackness and clamminess of it, 'tis not much to be commended: also it is often found to be subject to be infected by the venomous breath of Serpents, Toads, red Toads, and therefore is carefully to be avoided.

The temper of
Honey.

Now let us come to the Qualities of Honey; whereof some are first or primary, others derived from them; some formal, some specifical, which we deservedly call Energetical, or operative. In respect of the first Crasis or temper, Honey is thought to be hot and dry in the second degree; for which cause *Galen* did forbid those that are in Hectick Feavers, and in all Feavers, young men, or those that have the yellow Jaundies to use it; whereas in cold distempers he doth very much commend it, and did prescribe it to those that were troubled with a raw and watry stomach; whom if you gently anoint therewith, it doth very much nourish, and causeth a good colour and constitution of body. If you desire to know the second qualities of honey, (viz. the smelling, tasting, visible, tactile) the best honey ought not to have the eminent quality of any herb, or other thing whatsoever: and therefore the honey that, doth strongly smell of Thyme, *Galen* rejects; and yet is of it self a most sweet and fragrant smell, and not without a certain spirituous fragrantcy; such is that which in the middle of the spring, is perceived to be in the air about break of day. But if it have an ill savour, it is putrefied not being well kept. If it smell strong, it hath contracted some contagion from Hemlock: if it sting as it were and prick the nose with its sent, it is an argument of some poyson, or too much acrimony couched in it. If it smell not at all, it is stark dead, no spirit in it. If it smell of Thyme, Linden, or Teil-tree, Rosemary, Box, Wornwood, &c. it shewes that it is degenerated into their nature. The like is to be said of the Taste of honey, which is known either by the herbs, age of it, or by the colour of it to be mixt, or adulterate, or natural, that is to say, striking, and filling the tongue with a certain fine and lively sweetness, so that it may seem to some to be a little tart.

As for what concerns the colour of the best honey; in the *Tigremahonick* and *Tagadosick* Region, that of a milky colour is preferred in hotter Countreys, that which is white and transparent, but commonly that which carries away the garland and is esteemed above the rest, is yellow, and of the colour of Gold. And in the second rank is that which is white and transparent, which I with *Aristotle* should put in the first place. For that it is a sign of pure honey and not infected with any tincture of herbs. The bright shining is also by him commended if it be not summer honey, for the honey that is gathered at that season of the year (like wax or butter) either by reason of the abundance of yellow flowers, or the scorching heat of the air, it comes to be of a deep and full yellow, yea almost quite red. But if the Erycan or Anthine appear reddish, it is not without cause accounted unwholsome, because it is not in its season. Suspected and of ill name, are the black, duskie, bright red, and above all the lead colours, which whether they appear in the comb, or in the honey, sometimes are evident signs of corruption and putrefaction, and sometimes of poyson. That honey is best in touch that is fat, clammy, glutinous, heavy, and most like to the clear liquor of Turpentine every where like it self, that is pure without any, or with very few dregs, that is melted with a very soft fire, and with the least cold as it were congealed into little stones.

The Energetical or operative qualities of honey are seen in the use of it; the which is of divers sorts, whether you turn you to the Apothecaries shop, or to the Kitchen, for so mightily doth it nourish, and preserve health entire, and men long-lived, that the *Greeks* thought the *Cyrneans* by reason of their constant using of it, lived long, being old men, as *Herodotus*, *Athenaus*, and *Diodorus Siculus* testifie. *Pollio* indeed being asked, how it came to pass that he lived to be so old as he was, made answer, Because from his youth he used Oyl without his body, and Wine mingled with

Honey

Honey within. More then this all flowers, fruits, simples, and compounded medicaments, or confections by mingling them with honey are preserved entire from putrefaction; in which faculty or virtue it so excels, that even the *Babylonians* were wont to bury the dead corpses of their noble men in it; as *Herodotus* witnesseth in *Thalia*. Vintners also and such as deal in Wines that will play the knaves, when they observe a piece of Wine decaying, and at its last almost, then they put honey to it, to bring it to life again; by which means the sophisticated wine appears pure, and relishest very well upon the palate, though never so critical and curious. It is not subject to putrefaction. Fruits, and all other bodies are kept in it very long. Yet if it be but touched by its enemy, bread, it putrefies. They therefore that sell honey, are very wary, lest children as they pass by should dip their bread in it: for so it will presently corrupt, and turn into Ants or such like creatures; if we will believe *Paracelsus*, for his natural skill, in the nature of things, a most famous Philosopher. With admixtion of honey also *Galen* amendeth the naughtiness of sweet meats when they begin to fail. Honey mingled with other things, doth both nourish and cause a good colour; but taken by it self without any other thing, it doth rather make the body lean than nourish it; because it doth cause urine, and purge the belly beyond all measure. *Hippocrates* saith, if you take the seeds of Cucumers, or the seeds of any other plant, and keep them for some time in honey, and afterwards sow or set them, the fruit that groweth of them will taste the sweeter.

As for the medicinal and Physical vertues of Honey; It causeth heat, cleanseth sores and ulcers excellently, wears them away, and removes them in what part of the body soever gathered: as *Galen*, *Avicenna*, *Celsus*, and *Pliny* have observed. It perfectly cureth the disease which causeth the hair of the head or beard to come off by the roots, called the Foxes evill, and other filthy ulcers of the head. *Plin.* To regain hair lost by the disease aforesaid, and for long Agues, it is very effectual, if the party be anointed with it raw as it is; or with the honey-comb newly dreined or emptied. *Galen.* But above and beyond all, the Oyl of honey distilled doth effect it. The water that droppeth from the honey, doth excellently cleanse the skin, provoke urine, extinguish the burning heat of Feavers, open the obstructions of the bowels, quench thirst. The chaulk or salt of it, as it is of all corrosives, the least painful, so it is most energetical and operative, and therefore is very much commended by Chymicks, and Chirurgeons, for to cure that kernell or tumour of flesh which groweth upon the yard. But how many, and how ample vertues that quintessence of Honey (as they call it) hath attained against the strength of all diseases whatsoever, is excellently described by *Isaacus Belga*, the predecessor of *Paracelsus*. Nay without doubt, if wilde honey, and raw, was able so to prolong the health and life of *Democrates*, *Pollio*, *John the Baptist*, in a word, of the *Pythagoreans*, and *Cyrneans* (as aforesaid) how much more will it do being refined, and heightened to the highest degree of nutrition? The *Epicureans* who took the best way they could to provide for their health and their pleasure, fed alwaies upon Ambrosia, as *Tertius* reports, which did consist of a tenth part of honey; as if they meant by the use of it, to stave off all pains and griefs, and live free from all diseases and maladies. It doth wonderfully help the ulcers in the ears if it be powred warm into them, and especially if an ill sent be joyned with them. Moreover in their hissing, noyses, inflammations, *Galen* commands to intill Attick Honey, Butter, oyl of Roses, and as much warm water *Marcellus Empyricus* used to infuse into the ear that was pained. The same also very much commends honey mingled or kneaded with the ordure of a young Infant, to cure the dulness of the sight, and the white spots in the eye. *Vegetius* by this means cures the watery eyes and dropping of the eyes caused by rheume or distillation. First of all a little below the eye he drawes blood and anoints them with the purest honey till it be whole. But yet care must be had (as *Columella* very well hints) that as often as the eyes are anointed with honey, they be besmeared round about with melted pitch and oyl, lest the Wasps and Bees infest and hurt them. Hear also what *Marcellus* saith, touching the clearing up of the eyes, and he prescribes this: The honey pure and neat wherein the Bees are dead, let that drop into the eyes; or honey mixt with the ashes of the heads of Bees, makes the eyes very clear. And again mingle Attick honey with the first ordure the Infant makes, together with the milk of the Nurse; and with that anoint the eyes that are so dull what ever the cause of it be; but first of all you must binde the patient to a form or ladder; for otherwise such is the strength of the medicine, that he will not be able to endure it. Which is such a present remedy, that in three daies, it will fully restore the sight, and take away every blemish of the eye. The Gall of a Vulture mingled with the juice of Horehound (twice as much in weight as the gall is) and two parts of honey cures the suffusion of the eyes. *Gal. in Empirist.* Otherwhere, he mingles one part of the gall of the Sea-Tortoise, and four times as much honey, and anoints the eyes with it. *Serenus* prescribes such a receipt to cause one to be quick sighted.

Mingle Hyblean honey with the gall

Of Gents, 'tis good to make one see withall.

Give Infants butter and honey, for nothing is better for their breeding teeth, and for sore mouths. *Galen* bids us rub their gums with nothing but honey. For it wonderfully helps to their breeding of teeth, preserving, cleansing and beautifying of them. Also against the pain of the jawes. If with Arabian honey you joyn field-poppy, it cures it. And sometimes pure honey is

The medicinal
vertues of Honey.

is mingled with clear water: and this, as *Serenus* and *Pliny* testifie, doth notably cure the driness of the tongue in Feavers, the Quinsie, and the diseases of the Uvula, Throat, Jawes, of the Tonsils; against difficulty of breathing, and to cause one to expectorate, either by it self, or mingled with other things, it is highly commended by *Hippocrates*. And for the convulsion of the laps of the lungs (which useth to be a deadly disease) the drinking of cold water, and of that wherein a honey-comb is steeped is very effectual. Also, if the stomach be not hot, cholerick, bitter, nauseating or feaverish, it makes it strong and vigorous, and nourisheth it much, not suffering milk to curdle in it: it cleanseth the reins, boyled with water and butter it is good against the stone. *Avicenna*. It easeth the pain of the spleen, but it must be outwardly applyed with the dead Bees; for taken inwardly it hurts both the liver and the spleen, saith *Galen*. When it is raw it looseth the belly, but boyled with the Bees, or with new cheese it bindes the belly so much, that *Galen* holds it to be a secret against the Dysentery and colick passions: so doth *Celsus* also and *Pliny*. *Hippocrates* mingled honey with all Medicaments that were to soften the belly. Honey mingled with rosin, is a cure for the cold Testicles, as *Pliny* saith, who also affirms that the ashes of Ox-leather mingled with honey, cures all running sores, and botches. Nitre with honey and Cowes milk, cures ulcers of the face; and the froth of honey with oyl of Walnuts, amends the burning of the skin: it is excellent for old people, and such as have cold stomachs; and being boyled it discusses wind, and moves urine mightily. *Galen*. *Hollerius* reckoneth honey amongst Diaphoreticks, because it openeth and maketh the passages clear: *Galen* placeth it amongst Diureticks. It layeth down its acrimony by being mingled with water, or being boyled; and therefore *Galen* prescribes boyled honey, to close up ulcers that are hollow. Salt with meal and honey takes away the pain of a joynt that is dislocated, discusses the swelling, and makes it more apt to be reduced. I might hereset down the plaister of *Actius* and *Aegineta* called *Diamelleum*, the Tapimel of *Arden*, and all syrups that were anciently made of honey. In whose place the Neotericks have put sugar, but I know not by what reason. For if honey of *Athenis*, or some as good, be at hand, and doth not want its due preparation, do not use sugar that is earthly, reedy and so full of dregs, nor comparable either for use, original, or any way whatsoever with this heavenly dew honey. But to let this pass, let us reckon up the kinds of drinks and meats made of honey. Six kindes of honey-drink the Ancients made principally. Honey and water, honey and wine, honey and vinegar, the washing of the combs, juice of some grapes and honey, sea-water and honey.

The first is called by *Pollux* and *Nicander*, *Hydromel*, or *υδμελις*. *Galen*, *Pliny*, *Aegineta* and *Dioscorides* have set down the making of it. *Hydromel* of *Galen*. Take sweet pure clean fountain water 8. pounds, the best honey 1. pound, boyle them at a soft fire in an earthen vessel, take off the skim a top oft times, and boyl it to its thickness. If it must be drunk presently, it must be made thin as water, if it must be set up to keep, boyl it longer, till it be thick, as a julep; if it be kept long it pierceth deeper into the parts far off, and is sooner converted into choler. Also boyling acquires to it many more faculties; for being little boyled it inflates more, it purges more, and nourisheth lesse. Longer boyled, it dissipates wind, nourisheth more and purges lesse. It is spiced at pleasure, with Ginger, Saffron, Gallia Moschata, Lignum aloes, &c. It is made also another way, of honey 1. pound, water 8. pound, leaven 3. ounces; put all in a wooden vessel, leaving three or four fingers empty that it may work the better: when it hath done working, stop the vessel and let it be well hoopt, and after three months it will be fit to drink. *Hydromel* of *Pliny*. Take of pure rain-water that hath been kept five years, 12 pound, boyl it to thirds, add to it a third part of old honey, and in the dog-daies set it in the sun for 40 daies, and letting it so stand, on the tenth day stop the vessel, this is called *Hydromel*, that with age will taste like wine, made no where better than in *Phrygia*. It was given to sick people that desired wine, but now it hath been forbidden many years. *Hydromel* of *Aegineta*. Take the juice of bruised Quinces 5 pounds, fountain water Sextarii, boyl them till they grow soft, take them from the fire, let them cool, then strain them, and crush out the Quinces and cast them away, add to this water half honey, boyl it, scum it, till an eighth part be consumed: some make it of sweet Apples or Pears the same way. *Hydromel* of *Dioscorides*, is made of two parts of old rain-water, and one part of honey mingled, and set in the Sun. Some call it *Hydromel*, because it is wont to be made of the washing of the honey combs with water, but it must not be made stronger, because it will hurt sick people by too much matter proceeding from the wax. *Hydromel* after it hath been long kept, is as strong as small wines, or Lora, being but half so old. Wherefore it is preferred before them in abating inflammations. The use of old Metheglin is condemned, for such as are inflamed or costive, but it is good for weak stomachs, and such as loath their meat, or sick people that sweat much, or for those that are thirsty, or after a burning feaver hath wasted a man. *Actius* describes a Clyster only of honey and water to move the belly, and with the same he cleanseth hollow ulcers. *Galen* commends, and uses Melicrate (wherein some Hyssop, Origanum, or Thyme, or Peniroyal hath been boyled) to prepare and purge gross humours in an acute disease, but he commends it not for the want of a stomach. Lately the English found out a new composition of *Hydromel*, (they call it *Varii*) and serves better for ships than any Wine. The preparation is this, Take Barley torrefied after due steeping in water, what you please, boyl it long in 5 quarts of fountain water, till it taste well of the malt: 1 pound of this boyled with 8 pounds of honey, and 20 pounds of water, makes a drink that taste most sweet,

sweet, and is most healthful for use. It nourisheth well, is hardly corrupted, and keeps very long. *Hydromel* of the *Moscovites*. Take of the decoction with Hops 12 pounds, purified honey scummed 1 pound and half, toasted bread strowed with the flour of malt, one piece, put all into a wooden vessel well covered, and place it near a stool, take away the froth that riseth, twice a day, with a wooden skimmer that hath holes in it; after 10 daies set it up in your cellar, after 14 daies drink it: They make it the same way in summer with fair water, and made this way they drink it in winter, and when they desire to be drunk. In Russ and English they call it *Mede*.

2. *Oenomeli*, it is called honeyed Wine. *Pollux* calls it *Melicraton*; *Plautus*, honeyed Wine, others call it *Mulsum*. *Aristeus* was the first that brought this into *Thrace*, being taken with the incredible sweetness of Honey and Wine mingled together. *Mulsum* made of honey of *Heraclaea*, when it growes old ceaseth to be hurtful. *Pliny*. The new writers describe this potion thus, Take 1 gallon of the best Honey, 6 gallons of old Wine, Salt 2 ounces; it must then be skimmed as it works, then put in the Salt, and season it with Annise-seed, and roots of *Elecampane* let down into the vessel with a bag. The *Egyptians* make it otherwise, namely of Raisins and Honey, which they call *melichron*, because it is of a very sweet taste. *Oenomeli spiced*. Take Pepper washed and dried, 8 scruples, *Athenian* Honey 1 sextarius, and 5 sextarii of old white Wine, mingle them. *Celsus* (as I remember) and *Calins* speak of it. *Aurelianus* in the cure of the *Sciatica*. Also there is a kinde of *Mulsum* which the Greeks call *Kuon uiza*, consisting of 36 ingredients. *Goreus*. May be it is the same which *Athenaus* calls *uina uinea*. For *uineus* is a drink made of Wine and Honey, and divers herbs mingled. Such as our *Welch* men call *Merheglin*. The *Irish* prepare a distilled *Oenomeli* made with Honey, Wine and some herbs, which they call *Usguebach*, not unfit for a nation that feeds on flesh raw, or but half sod. *Mulsum* made of sweet new Wine the Greeks call *Nectar*; to new Wine sodden, they add a tenth part of Honey, but this kinde is offensive to the stomach, and causeth windiness; it is given to purge the belly. *Hippocrates* calls it *Melibedia*, and *Melichronas* *Galen* notes. *Athenaus* writes that another kinde, which was true *Nectar* indeed, was wont to be made about *Olympus* a Mountain of *Lydia*, of Wine, Bees-combs, and sweet flowers. I take notice that *Alexandrida* did not think *Nectar* to be drink, but the meat of the gods. For he saith, *I eat Nectar chewing, and ministering to Jupiter, I drink Ambrosia*. Yet *Homer* and the greatest part of the Poets took *Nectar* for drink. *Dioscorides* made *Oenomeli* thus, Take old Wine 2 Sextarius's, the best Honey 1 Sextarius. Some that they may drink it the sooner, boyl honey with wine and strain it. Some for profit sake to 6 sextarius's of new wine working, add one of honey, and when it hath workt, they put it up in a vessel, for it remains sweet. The use of honied Wine is this: It is given in long Feavers that have weakened the stomach with crudities collected in it. It looseth the belly gently, it provoketh urine, it cleanseth the stomach, it is good for the disease of the joynts, faults of the reins, a weak head, and to women that drink no wine, for it is pleasant in smell, and nourisheth the body. It moveth vomit drunk with oyle, and it is profitably given to them that have drunk poison; as also for such as are weak, and their pulse is feeble; for such as are troubled with a cough, and a short breath, or *Impostume* in the Lungs, and those that are wasted with extream sweating. But then it is for to mingle it with *Hydromel*. Also *Galen* prescribes to them *Melicate* qualified with water, that have had a shaking fit not above a week, and nature being yet strong. Some there are that utterly condemn this in Feavers: but that must be understood of some times in Feavers. *Romulus*, a certain guest of *Cæsars*, being asked how he had preserved the natural vigor of his body and minde so long, (for he was above a hundred years old) he answered, Without with oyl, within with honey and wine sodden together, as *Pollux* did: That we may the more wonder at the use of *Mulsum*, which the Ancients esteemed very much, for that they were perswaded that all acrimony of the minde, was pacified with sweet liquors, and the spirits made peacable, the passages made softer and fitter for transpiration, and that it was also physick for manners. *Plinius*.

3. *Oxymeli*, or honeyed Vinegar is thus made, as *Pliny* thinks. Take honey 6 pound, old Vinegar 5 *Hemina*, Sea-salt 1 pound, rain-water (which *Galen* likes not of) 5 sextarii. It must all be made scalding hot ten times, and then set in the Sun, till it grow stale, and *Oxymel* is made. But it lasts not above one year. All these, as also all made Wines are condemned by *Themison* a chief writer. *Galen* prepares it thus. Let the best honey be clarified, and add so much wine-vinegar to it, that it may please the sick mans palate, boyl them till they are well mingled; and when you will use it, mingle as much water as you please: it is boyled enough when it sends forth no more scum. Some there are perhaps that deliver these compositions somewhat otherwise, and *Dioscorides* he differs from *Misue*, and *Nicolaus* from them both. In *Misue* you shall finde ten several sorts of it; in *Nicolaus* I have seen seventeen: some simple, some compound with Squills, Thyme, Flower de luce, and other herbs and roots.

Also *Gesner* brought in an *Oxymel* with *Hellebore*, which he commends not a little in his Greek Epistle to *Adolphus Otto*. To make thin, thick and clammy humours, and to root them out; but especially to make way for insensible transpiration, that is to draw forth from the center to the superficies of the body. But you shall finde every where scattered in the Book of his Epistles, what force it hath against *Melancholy*, *Cacheria*, *Dropsies*, *Epilepsies*, and Feavers, where also you have the *Oxymels* made with *Hellebore*, the great and the small.

See Eudymus
his Nectar in
Wickerus his
special Anti-
dote. fol. 191.
& 195.

4. *Apomeli* of *Philagrius* in *Agineta*. Take white combs full of honey 1 pound, fountain-water 3 pound and half; break the combs and press out the honey, boyl this water and honey together, untill the froth of it, and that which as it were the waxy part swim a top, and be by degrees taken off, when it is cool put it into a vessel. It cools lightly, as *Galen* saith, wherefore in Phlegmone, and weariness in a Fever, it is very good. *Avicenna* his Syrup of Honey, seems to be the same with this. In *Nicolaus* you shall finde three kinds of *Apomeli*, and in *Actius*, *Oribasis*, *Actuarius* yet more; for they are changed according to the nature of the disease and the sick patient, that is the reason that we had rather only touch upon them, then to describe them at large. It is drunk all the summer to cool the body, at which time any man may drink of it, (especially when it growes fowrish) it is held to be of a middle nature between a *Mulsam* and an *Oxymel*. *Galen*. It is also useful to expectorate with, to move urine, to purge the belly, and to cut thick humours. *Agineta*, *Ruelius*.

5. *Omphacomeli*, (which *Grapoldus* did not well translate Bitter honey) it is made of the juice of unripe grapes, 3 sextarii, and 1 sextarius of honey, boyled together, or set a sunning for 40 daies: when it hath done working, put it in a vessel and stop it close, and keep it for your use. The same way almost is *Melomeli* of Quinces made, *Rhodomeli* of roses, honey of Myrtls, Rhodostacte, &c. you may finde their descriptions and use in *Actius*.

6. *Thalassiomeli*, is made of equal parts of sea-water, rain-water, and honey purified and set in the sun in a pitched vessel in the Dog-daies: some to two parts of sea-water add one part of honey, and so tun it up. They both purge, but this hath far the less. *Gorranus*. It is pleasant in taste and smell, it purgeth gently, without troubling the stomach at all. *Pliny*. And thus much of Honied drinks.

It would be too long for me, and tedious to the Reader, should I set down all kinde of Meats which the *Athenians* provided with honey, and other ingredients; therefore it shall not be needfull to rehearse them; and it may be it is impossible: for divers Nations did variously mingle honey with other things, as with milk, meat, flour, wheat, cheese, and with Sesama, whence are these meats made of honey called *χέρνα, ἀλευρα, κηρύλλοι, σπονμίδες, μέλιμυλα*. Juncates or honey-meats, and wafers, they have divers names as the thing is made. *Athenians*. They sacrificed to *Ceres* this bread of felicity, as the Scholiast upon *Nicander* sheweth, we call it honey-bread. Also the Scripture teacheth, that the nations offered wafers made with honey to the Sun and Moon, and to the Queen of heaven: wherefore *Moses* forbid the Israelites to offer honey in their offerings unto God, *Leviticus* the 2. But it may be that was rather forbid the Jewes because honey hath a power of fermenting. Also they made it with suet, fresh cheese, oyl and raisins; also to cause sleep, the Ancients made a kinde of meat of honey and poppy-seed, very pleasant, which they called *Cocetum*, as *Festus* reports. Also *Ambrosia* which was held to be the meat of the gods, had that exceeding sweetness, whereby it was thought to be so healthful, from honey, to make men immortal; of which *Athenians* and *Bellonius* write at large. But the *Indians* have the best and the most wholesome juncates, who were held to be *Barbarians*, but the truth is, they may for their wit be compared with any in *Europe*, and for what I can see, to be preferred before them.

But before honey be used it must be clarified: which is thus performed: Take honey and fountain water distilled of each 2 pound, or as much as you please, boyl them and skim off all that swims a top, till all the water be consumed. Then clarify it with 12 whites of Eggs. *Abynzoar*. But if you make it hard, pure, and fast together, mingle half a pound of the best wine to one pound of honey thus clarified, boyl them, skimming them till they grow hard, put it in a vial, and set it in boyling water, and it will grow clear, and stony like sugar-candy. If honey be but mean, it will grow better by boyling: whether honey be sophisticate or pure, you shall know by burning it; for what is not sophisticate will burn purely. *The Author of the Geoponicon*. But if you would separate the quintessence of honey, oyl, salt, water, vinegar, see *Isaac Belga*, the treasure of *Euonymus* and other Chymists, we will not venture into this ocean, being already plunged in the harbour. Now I shall shew you its first inventers.

Saturn was the first inventor of honey as *Macrobius* and they of *Cyrene* boast. *Calius* and *Pliny* say that *Aristeus* first invented honey-works. But *Diodorus Siculus* writes, that the *Cretes* of *Crete* first found out the use and way of honey. Some ascribe this to the *Thessalians*. Others to *Melissus* the most ancient King of the *Greeks*. Some to *Bacchus*, as *Ovid* testifieth. The *Greeks* feign, that a Nymph called *Melissa* first found out honey, and the use of it, and thence she had her Name given her from Bees. Who found it, or when, it is not much matter. It is a heavenly gift, and very profitable for men, if they use it well and warily.

CHAP. I.

CHAP. VI.

Concerning Wax, Bee-glew, dregs of Wax, Pissoceros, Bees-bread, and of their Nature and Use.

WAX in Hebrew, *Donagh*; in Arabick, *Mum*, *Examacha*, *Zamaches*, *Aberan*; in Greek, *κηρίον*, *κηρός* and *κεράδος*; in High Dutch, *Wachs*; in English, *Wax*; in Brabant, *Wafs*; in French, *Cire*; in Italian, *Cera*; in Spanish, *Cicrai*; it is either natural or artificial. Simple and natural Wax is the thicker part of the combs that contains the honey; and it is either virgins wax, or of a second sort; virgins wax is that the younger swarms of Bees make from the young branches of flowers. (That is the first Swarm put into a new Hive.) For so, as *Aristotle* and *Hollerius* testifie, the Bee-masters call it, which they diligently separate from the first and new combs, as being by nature the most perfect of all: the second sort, though they reject not, yet is it short of the other for esteem and worth. The way they make wax, is this: They creep upon the flowers first with their fore-feet, and they touch them but lightly, then they wipe and rub themselves in the middle of them; then they nimbly and artificially lay down the tincture of the flowers which they have wrought with their water or moisture, and compacted between the legs of their hinder feet, and having gathered as much in quantity, and in form like a lentil, when they have this burden they carry it home to their houses. That matter is of divers colours for the nature of the flowers, as yellow, red, pale, saffron coloured, white, black: which is the cause that the wax is of so many colours: they make wax, saith *Pliny*, of all flowers and plants, except sorrel and arrach. Artificial wax, is that to which our labour and art must be used. Divers Authors use divers waies to make wax. *Palladius* in the month of *July*, takes out the natural wax which he first prepares softly in a bras vessel full of boyling water, cutting the combs small, and after that in other vessels he makes it up into forms, being melted. *Pliny* takes another way. The wax is made when the honey is pressed forth, but first they are cleansed with water, (that no reliques of honey remain) and he dries them three daies in the dark or in the shade. The fourth day he melts them at the fire in a new earthen pot, the water covering them, and then he strains them through a basket; again the wax is boyled in the same pot and in the same water, and other cold water is put to it, so often as you see the vessels smeared about with honey. *Columella* goes this way. After that the remainders of the combs are diligently washed with clear water, the honey having been first well strained out, they are cast into a brasle pan, then he put water to them, and melted them at the fire, then he powred the wax through straw or rushes to strain it, and then he boyled it again as he did before, and then putting water to it, he made it of what form he pleased, and when it grew hard it was easie to take it forth, because the wax hath water under it that will not let the wax stick to the forms. Now wax differs two waies, for goodness and for use. The best wax is collected by the principal Bees, and is so wrought by the best artists, that it may appear white, tender, handsome, all like it self, pure, somewhat fat, well sented, without nerves or skins, hairs or any superfluous matter. Such as *Nonius Marcellus* describes out of *Varro* for *Tarentine* wax made by the Bees or *Miletus*. Wax is so much the more depraved, the farther it is from these good signs. The use of wax is twofold, for physick, or for other matters what concerns physick: wax is a mean between hot and moist, cold and dry, and emollient. It hath some gross parts, and that stopt, it not only dries, but seems by accident to moisten by hindring transpiration. Hence it is the matter of other medicaments. But by it self it digests lightly, being laid outwardly, for it hath a little discussing hot faculty, of which it partakes as much as honey doth. In drink it cures the dysentery, ten grains of wax swallowed so big as millet seeds, will not suffer milk to clodder in Nurses breasts. *Dioscorid.* *Aetius* bids to give it in the bigness of three Tares. A certain *Anonymus*, prescribes this remedy against pains of the head and malignant humours arising from a Feaver or any other cause. Take virgins wax what you please, soften it at the fire that you may work it at your pleasure: lay it as a cap on the shorn head of the patient, and upon that put on a linnen cap that it fall not off. After three daies lay it off, or use it so long till you finde the pain gone. Put wax into the hollow tooth that akes, and with a hot probe touch it. *Archigenes*. Wax applied to the nerves and tendons being bare, will cover them with flesh and cure them. *Aetius*. For the cold pain of the joynts. Take a clout dipt in melted wax, lay it handsomely and as closey on as the sick can endure it for one night, and it will cure it. *Galenus*. More-over it is good to anoint the ears with Bears grease, and Buls tallow, and melted wax. *Marcellus*. You may discuss corns in the eyelids with a fomentation of white wax. *Gal. ex Archigen.* No man that is not an enemy of truth, will deny but that oyl of wax is of principal use to cure pains of the Gout, to soften hard swellings, and to heal wounds and ulcers. Also it is mingled as *Galen* witnesseth to the medicament of *Asclepias* against an *Ozena*, and it is a certain cure for the Jaundies. A certain Lady of most blessed memory, wonderfully recommended these pills to *Gesner*: Take the yolk of an egge boyled hard, and as much wax, with some grains of saffron and syrup of wormwood. Make pills to take morning and evening. They cause thirst exceedingly, but being continued by degrees without drink, they root out the disease. Also a ball is made of wax to keep up the womb

womb subject to fall down; and medicaments made up with it will last the longer. *Clodius* the follower of *Asclepias*. The *Greeks* were wont to give the Cyrenian juice wrapt up in wax, to swallow it the better. *Celins Aurel*. It is also the ground of all Cerats and Plaisters. *Myrepsus* was the first that made a plaister without wax. It not only preserves the living, but it keeps the dead also from putrefaction, for which cause, as now it is used by us, to wrap up persons of great fortunes in wax, (as *Strabo* reports the *Persians* were wont to do.) By a waxen probe hollow ulcers are best to be searched. The *Carthaginian* wax is the best for medicaments, the next is the *Pontick*, which is very yellow, and smells like honey, being very pure. *Pliny*. Which thing I wonder at amongst honey that is venomous: the third in esteem is from *Creta*, which is from abundance of Bee-glew: the last is the *Corfick* wax, because it is collected from box, it is thought to have a physical quality.

Now follows the use of Wax otherwise. They that are rich, or sick, or great men, desire their candles to be made of it, by reason of the sweet smell. Also the use of wax is not small in stopping the chinks in vessels, for tents in the camp to keep out rain, for bed-ticks that the feathers fly not out, to joyn pipes made of reeds, as *Ovid* sang concerning the shepherds of old.

And with the Reed well waxed they play'd and sang.

Also the most excellent Painters painted with wax, as *Pliny* reports, and they adorned ships with it. This kinde of painting, though it were not hurt by salt, nor by the sun, nor by the wind, yet it was lost we know not how, when *Apelles*, *Protogenes*, and *Zeuxis* died. Also the Ancients were wont to smear over their writing tables with wax before that paper was invented, as *Juvenal* describes it. And the younger *Pliny* in his Epistle to *Trajan*; I fate by the nets, there was no hunting pole or lance by me, but a style and writing tables, I did meditate and set down some things, that though I should have my hands empty, my writing tables might be full. Hence proceeded those old forms of speaking, In the first, second, third, or last wax. For *Suetonius* proves that the *Romans* writ their Testaments in wax; in the life of *Cesar* in these words. He made *Q. Pedius* his heir to the last farthing, the rest he placed in the bottom of the wax, that is, in the last part of his will. Nor is the use of sealing wax little, whereby we seal letters and instruments. Of this there are four principal kindes, the *Punick* or white, the red or *Indian*, the black or *American*, the yellow or *European*. The *Punick* is made thus. The yellow wax is often laid in the open air, then they boyl it in sea-water, adding Nitre to it: then with skimmers they take off the flower of the wax, and they powr it into a vessel that hath a little cold water in it; then they boyl it apart in sea-water, then they cool the vessel. This is done thrice, and they then dry it on a bul-rush hurdle by day and by night in the open air, for this makes it white, the honey being drawn forth by the Sun, and the yellow colour breathed forth: when it is dryed they melt it, when it is melted they cover it with a thin cloth, and set it in the sun, after it hath stood in the sun it becomes exceeding white, being boyled once more. Wax is made white otherwise, but this is the most proper for medicaments. *Pliny*. I see that the *Greeks* speak of is no other than which *Pliny* calls the *Punick* wax. *Aetius* speaks of white wax in the *Unguent Martiatum*, and *Paulus* speaks of it also. Black wax is either natural, as in the *Molucco* Islands, and many parts of *America*, it is gathered by the Bees themselves (as we read in *Thevet* and in the Centuries of Navigations) or artificial, adding the ashes of paper. Red wax or like *Minium* of *India*, is made with mingling *Anchusa* or *Cinnaber*. There is another kinde of red wax, hard like a stone, but easie to break, the Merchants think their letters sealed with this to be very sure: yet there are some knaves so cunning that they will open them and shut them again not hurting them, that no man can possibly discern it; which art, though a chief Impostor shewed to *Pennius* when he was at *Paris*, yet he was too honest to reveal it to this mischievous age. The *European* honey is of the natural colour, that is, yellow. But the colour and variety of things hath so bewitched us, that we are not content with natural colours, but we must imitate the *Punick*, *Indian*, *American* waxes, and above those we must have green, dark light, blew wax, made of Verdigrease and other paints, and some Turpentine.

Propolis the *Arabians* call *Kur*, the *Greeks* call it *σύνιον*, *σύνιον*, *σύνιον*, *σύνιον*, the *German*s, *Vorstotz*, *neben Wachs*, *Wachs winden*, *stop Wachs*; the *Helvetians*, (if I mistake not) *Ber*, and *Binnen trost*; the *English*, *Hive-dross*; the *Spaniards*, *El vetun de las colmenas*. *Scribanus* takes it for *Virgins* wax: *Sylvaticus* falsly takes it for the dregs of the Hives: *Andreas Bellunensis* calls it the foulness of the walls, and sayes, that some abuse it for *Bdellium*. Some maintain that *Propolis* drops from trees, others say it is the first comb. It is indeed a thicker yellowish matter, sweet sented, like to *Storax*, and dustie like *Mastick*, like to wax, but not yet made wax, whereby all passages are stopt against cold and rain. The third sort is that black matter, and sharp sented, which *Aristotle* calls *Mityr*, *Gaza* and *Pliny* call *Commofis*, the dregs of wax: the second is called *Pissoceros*, as you would say, a matter made of pitch and wax. The third *Propolis* is of a middle nature between these two supporters and wax, laid very thick at the mouthes of the Hives, chiefly in summer; and therefore it is called *Propolis*, as you would say belonging to the suburbs. Because the Bees build with it at the doors before the Hive. *Propolis* (saith *Cordus* out of *Pliny*) perhaps is some rosin gum, growing upon the budding places of trees, which Bees gather and hang about the entrances of their Hives, to stop all chinks in winter against the cold. There are four sorts of it. The first is collected only out of the black Poppy, which they call *Aegyrina*, that is, yellow; it

is soft to be touched, and sticks like bird-lime, it smells sweet and comfortable to the head, causeth rest, and is like Storax, it tastes like Poplar buds. The second is gathered from the Birch-tree, and is of a colour between a yellow, ash, and green, it is soft and ductile also in handling. The third the Bees make out of the gum of the Poplar tree, called Alpina, but it is but seldom, and only in those places, where no other Poplar tree or Birch abounds, but only that is called Alpina. The fourth or mingled, is gathered and confounded from all these trees, so that it hath a mixt colour, sent, savour, and consistence. *Cordus* saith almost so much; now let us hear *Pliny*. Propolis is a kinde of middle substance between honey and wax; rather between wax and Pissoceros; and it seems to be gum collected by the Bees to stop up their hives. *Rondoleius* saith, it hath a thick substance, and the smell of leaven. *Pliny* saith, it smells so strong that some use it for Galbanum. But in the spring gathering time of honey, this part that shuts their cells may be separated, of which *Politianus* writes thus: That the Bee laies a white foundation of his various coloured wax. So that Propolis seems to be a thick foundation for the wax. But it is now out of use, nor can any man finde pure Propolis. For most Bee-masters taking out the Hives, when all the honey is run forth, whatsoever is in the combs they mingle together, and keep none pure by itself; nor is that wax which *Avicen* calls black Mum, any thing but the dregs of the combs, or else some sediment that sinks to the bottom of the water after the wax is boyled, and this is now Propolis; but Propolis is not pure, but some mingled matter. The nature of Propolis, is to dissolve in oyl as wax, but it is more ponderous and thick, and sinks to the bottome of it being melted, when wax swims on the top. Choose the sweetest, purest, not sophisticate with wax, which you may easily part by powring it into water. The best Propolis is said to be pure, most fragrant, without wax. That of *Crete* and *Passidinn* is the most effectual, the Bees collect the greatest part of it from the unctuousity of Storax and Labdanum; they collect it questionless out of other plants: for they make Propolis where neither the Poplar tree, nor Birch, nor any of the foresaid plants grow. Great is the vertue of pure Propolis, upon the gross spirits, and it draws faulty matter out from the depth. *Hollerius*. It is of the nature of wax, but it powerfully drawes forth. *Dioscorid.* *Celsus* placeth it in the number of biting remedies, saying that it digests and moves matter in ulcers. *Aetius* sayes that it heats, discusses, ripens, cleanses, attracts. The cleansing force is not very strong, the attracting is strong enough, it is of thin parts, it heats in the second degree complete, or in the beginning of the third: you must first soften it with your hands before you mingle it with other medicaments, and then taking the rest from the fire, put it in and boyl it, for it will not well endure any boyling at the fire. It drawes out thorns and all splints that are within. *Aetius*. *Varro* saith, that for its manifold uses it was sold dearer in the market than honey. May be therefore Propolis was called holy wax, because of *via sacra* where they sold it at *Rome*, as *Largus* writes in the cures of hard swellings. They draw forth thorns and such bodies sticking in the flesh, with runnet, (especially of a Hare) powder of Frankincense, and Propolis. *Pliny*. It helps an old cough with its smell. It cures the rose with water, and roots out ringworms by anointing them. *Dioscorid.* It cures *Ozenas*: *Serapio*. *Pliny* l. 11. c. 7. tells of more of its Physicall uses.

Aristotle calls *Eritbaca Sandarachas*, others call it *Cerinthum*, and *Smerion*, l. 2. *Aristot. de Plant.* The learned call it *Vernilago*; some from the time of the year, *Vernix*; this Grew, saith *Niphus*, the countrey Lombards call *Carbina*, but ours *Taram*. It is the meat the Bees make, which they lay in the void spaces of their combs; it tastes bitter, it is made of spring dew, the juice of trees, and sometimes of gum. That of *Africa* smells little; that from the South parts is blacker; from the North is better and redder; there is much from the *Grecian* Nut-trees. *Menecrates* saith it is a flower, that shewes the future harvest. *Plin.* *Varro* saith, it is not meat, but glew, whereby the Bees fasten their combs at the ends together. It forcibly calls forth the swarms: where they would have the swarms light, they anoint a bough with *Erithaw*, or any other place, adding balm. *Virgil*, I think, following *Varro*, calls it glew. *Mytis commosis*, (*Stephanus* calls it *κόρυς*) and *Pissoceros*, cures strokes and ulcers. *Aristotle*. What use it hath in the hives, we said enough before.

The Use.

CHAP. VII.

Of Drones and Theeves.

THE Drone called in Latine, *Fucus*, is called in Greek, *κρόν* and *δρόνα*, in the Illyrian tongue, *Czaro*; in English, a Drone, a Dran; in High Dutch, *Traen*; Low Dutch, *Belonder* *straet*; in Spanish, *Zangano*; in Italian, *Ape che non fa mele*; In French, *Bourdon*, and *Fullon*; in the Hungarian tongue, *Here*; in the Polonian, *Czezem*. The word *Fucus*, a Drone, is derived as some think from *fur*, which signifies a thief, because privily and by stealth he makes prey upon the honey: although with more probability the word *fucus* may be so used, because he doth cheat and couzen the Bees, and under colour of keeping the Hives warm, (which is his office to do) he ransacks the combs. And for that reason, some with too much confidence, perhaps, derive the Latine word *fucus* from the Greek word *φρῆναι*, signifying to eat or devour; others will have it come *à fovendo*, in regard of their sitting upon, and nursing up the young swarm.

The description
of the
Drone.

Μεγίστη δὲ
μύσος πόν-
των, ἀκάντης
δὲ καὶ ῥόβρος.
Arist. l. 5. c. 22.

Some make the Drone to be a fourth sort of Bees, but not so well as others think, because he neither gathers honey himself, nor doth any way help in the working or making of it up. He is almost twice as big as the ordinary Bee, and somewhat bigger also than the Thief; he is as big likewise as the King, and somewhat bigger. Although they do not arrive at this corpulency, by the dispensation of nature, but by their course of life that they take. For when the Bee doth set apart cells for the Drones to breed in, they make them lesser than their own. And the little Scaffolds or worms whereof they come are far lesse than those of the Bees (who are sprung of the noble race, and of the stock of the Bees) in their first birth; which at length become a great deal bigger than the Bees, both by reason they never take any pains whereby to spend their natural superfluities; and also in regard that they do nothing night and day but (like oxen at the stall) never leave glutting and gorging themselves with honey, which afterwards they dearly pay for, when provision happens to be short, and there falls out a dearth. They have a bright shining colour, but mixt with more black than that of the Bees, in bulk they exceed them all, but yet without sting and idle. They both breed and live amongst the Bees, and when they go abroad, they presently spread all abroad aloft in the air, as if driven by violence, where for a while they besur themselves, and afterwards return to the Hives with good stomachs, falling greedily to the honey. But why the Drone should equalize the chief Bees in bigness, and the Bees also in having stings as well as they; let us hear *Aristotle* reason. *Nature did desire*, saith he, *to put a difference between them, that they should not be all of one kinde, which is impossible; for so the whole Stock would be either Kings or Drones. The Bees therefore are like unto the Kings or Master-Bees in strength, and in the faculty of generation; and the Drones only in bulk or bignesse of body, to whom if you should give a sting also, they would be nothing inferiour to the Kings themselves*, l. 3. de gen. Animal. c. 10.

They are called also of the Greeks *ρόβρος*, because they hide their stings. From hence *Hesiod* hath these words, *ὄξος ἀπὸ τοῦ ῥόβρου καὶ τῆς ἀκάντης*, who lives idly, having strength like the Drone that never sheweth his sting; certainly either they have no sting, or never use it to revenge themselves withall. *Pliny* saith plainly they have none, and terms them no other then in a manner imperfect Bees, and therefore *Virgil* calleth them *ignavum pecus*, a sluggish kinde of creature.

Suidas calls them *ρόβρος*, πρὸς τὸ καλεῖν τὸν ἐαυτὸν ῥόβρον, from hiding their sting. *Columella*, a sort of creatures of a greater growth, very like the Bees, and accordingly he placeth them in the rank of herding or swarming creatures. They suffer egregiously of the whole swarm many times, not only for their sloth and rapacity; but for that wanting a sting they seem effeminate, and not able to make any opposition. *Plin. l. 11. c. 17.* describeth them thus: *The Drone is an imperfect Bee without a sting; and begotten then after all when the Bee is decayed with labour, not being able to labour any longer.* Like as men past their labour, and stricken in age, beget of women when they have well-nigh left teeming through age and weakness, feeble children, incapable of procreation, little better then eunuchs: so it may not seem strange, how these Drones are too weak and impotent, being begotten of the Bees when they are exhausted with age and labour, inasmuch that they are fit neither to propagate their one species, nor to take pains as the other do. Which is the reason why the Bees so lord it over them, for they put them first forth to work, & if they loyter, they punish them without mercy. For in the moneth of *June*, two or three (especially the younger fry) drag out one Drone by himself alone, buffet him with their wings, gore him with their stings, if he resist them, they cast him down from the form upon the ground, and at length when they have made him weary of his life for anguish, they make an end of him and kill him; this I beheld with mine eyes, not without exceeding admiration and delight. Sometimes the Drones being banisht from the Hive, are fain to remain without doors, not daring to enter. Now for three reasons especially thereunto moving, the Bees do shut out the Drones: either when their number is above measure increased; or when there is not room enough left for the Bees to work in, or else when their honey fails, and they are straightned for want of provision.

And as they bear a deadly hatred against the Drones, so neither will they hurt any man if with his naked hands he shall take the Drones and cast them forth, no although they be in fight.

Κεντροῦ δὲ
μυ. Arist. l.
9. hist. c. 40.

The Drones, if the King be alive, (as some affirm) are begotten in a place by themselves. But if the King be dead, they are begotten of the Bees in their cells, and those are a great deal lustier than the other, in which regard, they are said to have a sting in their souls, although they are allowed none in their bodies by nature. Thus *Ælian. lib. 1. de Animal. Hist. c. 10.* The Drone which is bred amongst the Bees, lies hid all day between the honey cells; but in the night when he observes that the Bees are gone to their rest and are fast asleep, he sets upon their works and preys upon their Hives. This as soon as they understand (for that most of the Bees being weary with labour fall asleep, and some few watch) when they espy the thief, they moderately and gently chastise him, crop his wings, thrust him out from thence and banish him. But not content with this punishment, whereby to amend his fault, being naturally posselt with two ill qualities, idleness and luxury, he hides himself amongst the combs. But as soon as the Bees are gone forth to pasture, presently he falls upon the works, doth as much as in him lies, gluts himself with honey, and utterly ranfacks the sweet treasury of the Bees. They coming home again from feeding, as soon as they meet with him, no more favour him as before, with easie stripes, or as if they were about only to banish him again, but setting upon him with their stings they wound the felon,

felon, and no more satisfie themselves with chiding of him, but then he payes for his voracity and gluttony with no lesse than his life. This the Bee-masters say and perswade me that it is true.

Drones come forth without a King, the Bees never. For they alwaies descend from Kings. There are that affirm, that the young Drones are brought thither from other places from the flowers of honey-suckles, or of the olive or reed: But this opinion is infirm, and doth not stand with reason. *Aristotle* affirms that the great store both of Drones and Theeves are sprung of the longer and slender kinde of Bees, which doubtlesse he was informed of by the ancient Philosophers, or by Bee-keepers, and Honey-masters of his time. Some likewise say they are ingendred of putrefaction; as of Mules, so *Isidore*; of Asses, so *Cardane*; of Horses, so *Plutarch* and *Servius*. Others will have them to be the issue of Bees by a certain degeneration, when they have lost their stings, for then they become Drones, nor are observed to gather any honey, and being as it were gell of their natural strength, they neither do harm or good. Others on the contrary say, that the Bees are bred of the Drones, because long experience hath taught, that as the number of Drones aboundeth, by so much every year is the number of the Swarms greater. But that in my apprehension is rather a feigned than a solid reason: for therefore are there not (as some seasonable years it comes to passe) more Swarms of Bees, because more Drones are bred; but rather on the contrary, because the increase of Bees is more in regard of the clemency of the heavens, and the plenty of mellifluous dewes, so from the abundance of superfluous moisture proceed the greater store of Drones; as the Philosopher hath well collected. Or if we grant them this, that the more the Drones are every year, so the more Bees; yet notwithstanding we ought not to conclude from thence, that the Bees should derive their original of being to the Drones, but rather are beholding and indebted to them for their conservation, whilst they at the time of sitting and incubation, by their company do much further the procreation of the Bees; the throng of them (to use the words of *Pliny*) exceedingly encreasing the vegetative heat, by which they are sooner hatched up.

Their Generation

There are that divide the Drones into Male and Female, and will have them to propagate their species by way of copulation, although (as *Athenaus* writes) neither Drone nor Bee were ever seen to couple together. Yet forasmuch as Wasps and Bumble Bees, and all other Hive-born Insects, are seen sometime (though very seldome) to couple: I see no reason why the modesty of the Bee and of the Drone, whereby they abandon publick scortation and venery, should debar them of the private use of copulation. For they, as the chaster sort of men are wont, do it privately, and do naturally detest the impudence of those that publickly prostitute themselves in the day time, and when all eyes are upon them.

We have told you before in the generation of Bees, that some would make the Bees the male, and the Drones the female.

But when as (about the time of making their honey) they do so sharply punish them after they have cast them out of their Hives, and kill them (such violence which if used to their mothers, would much blemish the virtues of the Bees) I scarce think they are females.

Of what use then are they of in the Hives? is the Drone altogether unprofitable, good for nothing, idle, without sting, fit for no service, no way helpful to the publick? More than that, *Vergil* himself chants it to that effect:

Immunisq; sedens aliena ad pabula fucus.

The Drone sits free feeding on others food.

Where *Festus* takes the word in that sense for a slothful, idle, unprofitable creature, void of all employment, unlesse it be that of theeves and robbers, who take such a course that either they will live by the sweat of other mens browes, or else they will disturb the whole Kingdom. Such like *Hesiod* makes women to be, when he compares them to Drones.

*Οἷδ' ἐξῆδε μένοντες ἐμπροστίας καὶ σμῆλιν
Ἀλλότριον ἔμαλλον σφέτερον εἰς γαστέρ' ἀμύντας.*

Which is, I interpret it in Latine thus:

*Qui segnes resident contectis edibus, atq;
Sudorem alterius proprium: furantur in alvum.*

Or, in English thus:

Who sit at home, and to work have no will,
With others sweat they do their bellies fill.

But more creditable Authors propound divers uses of Drones: for if there be but a few of them amongst the Bees, they make them more diligent and careful in their businesse, not by their example, (for they live perpetually idle) but because they take the more pains in making honey, that they may be able to continue their liberality to strangers. They discover also signs whereby to know when the honey is come to maturity: for when they have perfected their honey,

*Ἀστυλῆς,
ἀλλήλῃς, ἀεργῇ
ἀκαλίῃς, ἀλοι-
τέρησις, ἀ-
σμβόλος, μη-
δὲν εἰς τὴν κοι-
νὴν συμφέρων,
as the Greeks
very many of
them have
written.*

217.

Plat. 1. 8. de
Repub.

ney, then they kill them in abundance, lest they should (as their custome is) rob them of it in the night; for as *Ælian* saith, the Drone all the day lies quietly in the honey cells, but in the night when he perceives that the Bees are in their dead sleep, he sets upon their works and destroys their combs.

But yet (if *Bartholomæus* deceive us not) they are not unbusied neither; but they build houses for the Kings, large and magnificent in the top and middle part of the Hive very finely covered over. They are therefore idle (to say say with *Aristotle*) in regard of making honey or gathering dew; but in regard of their Architecture so they are workmen. For as the Bees make the combs of the Drones hard by the Kings Court, so under the same consideration the Drones build the Kings houses, which is the reason why they and their young ones (if they have any) are sustained by the Bees. The cells of the Drones now grown up according to the bulk of their bodies are larger, but their combs lesse, for the Bees built these, but those the made themselves; because it is not fitting that the same proportion of food should be allowed to hindes and hired servants, as to the children or masters of the family.

Tzetzes in his elegant Poem, and other of the Greek Poets, make them to be the Bees cellar-men, or water-bearers, and do assign unto them a most kindly heat whereby they are said to hatch the young Bees and make them thrive. In like manner *Columella*: the Drones do very much help to breed the young Bees, by sitting upon those seeds out of which they are made. And therefore they are more familiarly admitted to the nursery to bring up and cherish the young brood, which when they have done, afterwards they are thrust out of doors. And *Pliny* also in his 11. Book. They do not assist the Bees in their Architecture only, but also in cherishing their young, the multitude of them causing heat and warmth, the which the greater it is (unlesse the honey chance to fail in the mean time) the more the swarmes of Bees are increased. To conclude, unlesse they had been for some great use for the Bees, Almighty God had never housed them under one roof, nor made them, as it were, free Denisons of the same City. Neither would the Bees lay hands on them at all as enemies of the State, but when their servile multitude doth increase and they take up offensive arms, or scarcity of provision were to be suddenly expected: in which tempest of affairs who would not rather judge that the Carpenter should be dismissed than the Ploughman? especially when without him by reason of want of victuals, we may hazard our lives, but the other we may be without for a time, without prejudice to our lives, and our selves (if need requires) are able to build habitations every one for himself. Now as these, being but a competent number of them, are very profitable to the Bees, so if they be over many, *Plato* not without cause terms them *morbum alvearium*, the Pest or Plague of the Hive, in the 8. book of the Common-wealth (where you may see a most elegant comparison between *Acolastus* and the Drone) both because they waste the provision of the labouring Bees, as also with their too much heat stifle them. This inconvenience the Author of the *Geoponicks* doth thus remedy; take the covers of the Hives and sprinkle them on the inside over night with water, and you shall finde them betimes in the morning when you take off the cover of the Hives again all over covered with the Drones; for when their bellies are full of honey, they are very thirsty, and are mightily perplext with an intolerable desire of water; so that they cling fast to the lid of the Hive; and it is an easie matter to put them all to death, or if you will rather to take away the greatest part of them. But if you take away the young ones and all, that are not yet come to have wings, and pluck off their heads, casting the bodies in again to the other Bees, you shall offer to them a very dainty dish.

Moreover also if you shall take the Drone and crop off his wings and cast it back into the Hive, he will if we may credit *Pliny*, pull off all the wings of the rest, *lib. 21. c. 11.* or rather the Bees themselves will devour the wings of the rest of the Drones that are left. For so saith *Aristot.* καὶ κηρὶνος τὸ πλεον ἀποκρίσας ἀφ' ἧς, καὶ λοιπὸν αὐταὶ τὰ πλεον ἀποκρίσσι. For it is not probable that either the Bees should crop one the others wings; or that the Drones should so far adventure, or be able to offer such violence to the Bees: so that as *Pliny* was mistaken in reading *εἶπε* for *αὐταὶ*, so also they do not a little speak by guesse, who refer the words *καὶ λοιπὸν*, the rest, to the Bees and not to the Drones.

But what the dreaming of Drones doth portend, what use they may be of in the way of Hieroglyphicks: let *Apomasaris* out of the Schools of the *Persians* and *Egyptians* declare. It shall abundantly satisfy for what we intended to speak of them, to shew their true use, true nature, generation, degeneration, description and name. But as for what belongs to Emblemes and Hieroglyphicks, and precepts for Manners; every mean capacity may furnish himself with a world of such like rules by observing their course of life; without any need of consulting with those abstruse *Egyptian* Priests.

Arst 1. 9. c. 25.
Plin 1. 11. c. 17.
Aristotle calls
for *οὐρ*, *Hes-*
chius *οὐρ*,
and from
thence I think
the Latine
name was de-
rived.

The Theeves are thought to be amongst the Bees of a kinde by themselves that are very big, and black, bigger in belly than the profitable Bee, and lesser than the Drone. So called because they devour the honey by stealth. Bees admit of the Drone into their company, and are glad of it as being helpful to them, for their benefit sometimes. But the Theeves being naturally odious to the Bees, steal upon their labours when they are absent, wasting and spoiling their provision of honey. Yea they do so glut themselves in the mean while, that they are not able many times to get out again they are so full, or to stand in their own defence; whereupon the Bees at their return without any more ado, severely punish them, and according to their just demerits kill

kill them outright. Neither do they eat up the Bees food, but also privily lay their young in their cells, whereby it comes to passe oftentimes, that the increase of the Drones and Theeves is no lesse than that of the true legitimate Bees. Now these neither gather honey, nor build houses, nor take any pains, as the other Bees do, for which cause they have watchmen which observe at night when they come home, and they defend and secure them from the Theeves, and if they spie a Thief come in, they set upon him and beat him, throw him out of doors and there leave him for dead or half dead at least. For so it happens, that the thief having filled himself with honey is not able to fly away, but tumbles up and down at the door of the Hive, till they that go out and in finde him, and having branded him with ignominy and scorn, deprive him of his life.

Aristotle doth not tell us of any office that the Thief is good for: but I think that he was made for this end, namely, that he might put an edge to the courage of the Bees in point of injuries offered them, and that they might be stirred up to more vigilancy and justice: for what use else do Theeves serve for in a Christian Common-wealth, who with incredible fraud lie in wait for the credit and estates of their neighbours.

Their Use.

CHAP. VIII.

Of Wasps.

THE Wasp is called in Hebrew, *Tsirgna*; in Chaldee, *Deibrane*; in Syriack, *Gnargnitha*; in Arabick, *Zamber*; in English, a *Wasp*; in Dutch, *Harsell*; in Italian, *Vespa*, *Vrespa*, *Moscone*; in French, *Guespe*; in Spanish, *Vespa* and *Abilpa*; Gothish, *Boolgetingb*; in Slavonick, *Wols*; Illyrick, *Osa*; Hungarick, *Daras*; in Latine, *Vespa*.

They are called *Vespa*, as *Calepine* notes, for that in the evening they seek about for flies to feed on.

The Greeks also have several names for them; commonly they are called *σφήκες*, *Eustathius* derives *σφήκη* *ἐκ τῆς διασφάγης*, because you may perceive them so divided in the middle that they seem to gape, as you may observe in the figure set down. The Scholiast of *Nicander* calls them *λευκοσπιδες*; of *Suidas*, *σφιδες*, and *σφιδες*; *Hesychius* termes them *αυαυα* and *αυαυαδες*; *Gaza* (but abusively) *αυαυα*, for they ought to be called rather *Crabrones*.

Now the Wasp is a winged Insect, gregal or hearding round like a ring, long, having four wings (of which the two former are the bigger) having a sting within, six footed, they have no blood, they are of a yellow golden colour upon black spots placed triangularly, the whole body is garnished with divers colours athwart, whence it may be *Pollio* called it *δίαχρους*.

Description

I think they all in general are armed with stings, (what ever Authors write that their Females are without stings) because when I was at *Ham*, a village town in the West, about the year 1587. having found an entire Wasps nest, I poured hot water upon all the females and killed them, and yet could finde none that had not a sting, either within their bodies, or sticking out.

The body of the Wasp is bound in the middle to the breast with a certain exceeding thin thred, that they seem to have no loins at all, and to be quite through open: whereupon that Greek Comick Poet calls those *Maids*, (which *Terence* by way of elegance calls *Bulrushes*) for their slenderesse in the waste *σφινος*, waspy or like Wasps. They make a buzzing noise also like the Bee, but more loud and hoarse, especially when they are angry; upon which came that proverb made by *Theocritus* in *Hodeporis*, in comparison of a bawling idiot, to a man of learning and parts, *σφήξ βομβῶν τήντος ἀνάλιος*, i. e. *The buzzing Wasp against the Grasshopper*.

Aristoph. in *Vespis.*

If you will have the endowments of his minde described, he is a political and flocking or gregal creature, subject to Monarchy, laborious, a lover of his young, and a lover of his neighbour, of a very quarrellsome disposition, and very prone to choler. It is a sign that their life is Political, because they live not solitary, but do build themselves a city eminent for structure, in which they are subject to their set lawes, and do yeeld to them as wel in their external actions, as in affections. Whereupon he Philosopher doth rightly reckon them in the number of the Civil or Political sort of Insects. They are governed also by Kingly power, not tyranny (as *Ælian* faith) although by nature very fierce; making his Argument, because Captains of the Wasps want stings, or if they have any, they never put them forth or strike with them. And although they be twice as big and hard above all the rest, yet are they not without gentlenesse, and grateful demeanour, with which also sometimes they restrain, and appease their rebellious and mutinous subjects.

The gifts of his minde and

But of their mutual love one towards another, every man is able to give a testimony; who soever he be that shall offer injury to any one of them near home, for with his buzzing and making

Love to one another, *Αλληλοφιλία* making

making a noyse, all the swarm being terrified issue out to the succour of their neighbour; and will cause the troublesome stranger, although armed, to run away (as they did the *Phaselites* of old) of whom *Ælian* reports that by the multitude and fierceness of the Wasps they were quite beaten out of the City.

Love to their
young.

Σφηνέουσιν αἰό-
λοις καὶ δῖν
ἣ δῦμον ἔχοι-
τες. *Iliad.* 13.

As for unnaturalness toward their young, that it is a vice which is very far from their disposition and nature, as many things do evince, so that above all, that with more than Heronick undauntedness of courage, they set upon those that would surprize them; neither do they stand in fear of either *Neoptolemus*, or *Hector*, or *Achilles*, or *Agamemnon*, the General of all the Grecian Forces, yea that divine Poet *Homer* in the 13. of his *Iliads*, when he would expresse the generous spirits of the Grecian Commanders, he compares them to a speckled Wasp, and endowed with the Wasps animosity and stout heartedness, when they are put upon it to fight for their house and family. They do moreover erect for their children large structures, (and as it were like those *Manfolea* of the *Egyptians*) of a round form, floored, and standing one on the top of the other. One of these fabricks most curiously built, was brought to *Pierius* when he was at *Belunum* out of a certain solitary grove. There were seven stories of building set one on the top of the other two fingers space between each of them, disjoyned by the putting of certain columns or pillars between them, that there might be a convenient space left to passe in and out of their lodgings. The diameter of the orbs up to the fifth story about twelve fingers over, all the other from the fifth are narrowed up to the top by degrees, so that the last is about five or six fingers broad. The greater round contains the first room, fastned to the bough of an old tree, very well fenced above with a certain rough-cast to keep off all wind and weather. Within are six square cells standing very thick together; but the middle concamerations the multitude of Wasps had filled, a very thin leaf being laid over every hole for a covering, some of which when *Pierius* had taken away he observed all those chambers to be full of Wasps creeping with their heads to the bottome of them. Those in the rooms below were certain imperfect things like Embryons or little worms, which were covered over with the same covering, as it were a winter Oyster, in expectation of the more milde season of the spring. Which building although there succeeded a very sharp winter did remain entire, and no way decayed; at length *Pierius* expecting what should be done with these little worms when the Spring came, he perceived nature to make no further progresse in her work with them.

But still the fabrick was kept by him, not without the great admiration of those that saw it, wondering much to see so much art and cunning in those little creatures, and that they were able to hold out to finish such an elaborate edifice. This relates *Pierius*. I also have seen many such, but of a different fashion, some like a Harp, some like a Cup, some like a Pear, some like a Toadstool, some like a Bottle.

The matter of their Combs is said to be confused, heaped up together, like bark or cobwebs, transparent, gummy, and made into very thin plates like leaf-gold; but I found it alwaies light like paper, dry, easily puffed hither and thither by the wind, and for the most part growing up from the bottom like a Turban. As for the place where they use to build, it is thought to be divers. If their chieftain be dead, they make their nests aloft in the hollow places of trees or walls, and in these as some affirm (though I never could finde any) they make wax also. But if they have their master Wasp, they build underground in six square cells according to the number of their feet, and after the fashion of the Bees. Their combs are made in the form of a large Toadstool, round, out of which there comes out in the middle or center as it were a little foot by which the cell is fastened to the tree, or to the earth, or to another cell.

Love to their
wives or fe-
males.

But so tender are they over their mates or females, that they will neither suffer them to take any pains, nor to seek after any provision; but they themselves bring in all necessaries to them, and do as it were enjoyn them to keep at home.

Sironi, 2.

and do as it were enjoyn them to keep at home.
All which things, and each particular being considered by any man, he must needs confesse the pain, industry, cunning, sweat and labour of the Wasp. As for their choler and frowardnesse of the Wasp, not only poultreys that scrape in their nests and trouble them, but in like manner all that provoke them do know them to be implacable: from whence arose the proverb σφηκας ἐκ-
τιζεις, i. e. to contend with a Wasps nest. Of which sort something to that purpose was written on the Tomb of Hippocrates, μη πως ἐγχεις σφηκα τὸν κοιμώμενον, i. e. Do not rouse a sleeping Wasp. And so Aristophanes in *Vespis*, when he would expresse a cruel, morose, fretful, quarrellsome sort of people, calls them *Wasps*, διεσφηκόμενοι. Clem. Alexandrinus also, when he would set forth the acerbity and bitterness of those vices that lye in wait for the souls of men, saith, διστοί γὰρ ἀνταγωνισαὶ ταχῆς καὶ ἀλυμπνοὶ, καὶ μάστιγα ἡδονῆς, i. e. these, especially pleasure, are sturdy Olympick Antagonists, and more tart than Wasps. To which may be added a certain speech of Themistius discourting of the speeches of many malevolous adversaries, ἡγεῖσθαι (saith he) ἐν ἑαυτῷ ὡς εἰμὶν πᾶσι σφηκῶν κατασ-
μίνων: they railed upon me as it had been a swarm of stinging Wasps. Which oftentimes proves mor-
tall, as Phrynichus knew by experience from the Milesians, and the Phaselites were sufficiently in-
structed by their own great miseries: yea, whosoever he be that shall challenge this generous and
redoubted Champion into the field (to use Niscander's words) shall obtain but Cadmus conquest,
he shall surely be worsted and slain; for they do not fight so much with their stings as with the
strength of their bodies, and more than that, when they fight they will never give over, being not
only strong but resolute.

Notwithstanding they differ in their original, kinde, sex, age, place, diet, and labour.

Isidore affirms that Wasps come out of the putrefied carcases of Asles, although he may be mistaken, for all agree that the *Scarabees* are procreated from them: rather am I of opinion with *Pliny* l. 11. c. 20. and the Greek Authors, that they are sprung from the dead bodies of Horses, for a horse is a valiant and warlike creature; hence is that verse frequently and commonly used amongst the Greeks.

Their difference from others.

ἵπποι μὲν σφῆκες γένονται, ταύροι δὲ μέλισσαι.

Wasps come of Horses, Bees from Bulls are bred.

And indeed their more then ordinary swiftnesse and their eagernesse in fight, are sufficient arguments that they can take their original from no other creature (much lesse from an Asle, Hart, or Oxe) since that Nature never granted to any creatures else, to excell both in swiftnesse and valour. And surely that I may give another sense of that Proverb of *Aristotle*, Χαίρετε ἀνιπποδωτάδες ἱππων, Hail the daughters of the wing-footed steed: this would I suppose fit to be spoken in way of jest and scorn to scolding women, which do imitate the hastiness and froward disposition of the Wasp. Other sorts of them are produced out of the putrid corps of the Crocodiles, if *Horus* and the *Egyptians* be to be believed, for which reason when they see a Wasp, they set it forth by an Horse or Crocodile. *Nicander* gives them the name *λυκοσπίδες*, because they sometimes come from the dead carcases of Wolves. *Bellenacensis* & *Vincentius* say, that Wasps come out of the putrefaction of an old Deers head, flying sometimes out at the eyes, sometimes out of the nostrils: From

Lib. 2.

hence *Cardan* seems to have collected this observation, that out of the corruption of every creature, there is another sort produced; which would be very absurd; For by this means Generation would be infinite, and likewise daily experience doth teach the contrary. For that little beast which I term *Tatium Alberti*, doth naturally produce nothing at all, as I have tryed a thousand

Albertus l. 15. tract. 1.

times. There are those also that affirm that Wasps are begotten of the earth and rottenness of some kinde of fruits; as *Albertus* and the *Arabick* Scholiast: but for the most part they are begotten by copulation, and the mutual embraces of the male and female; which although *Arbennus* l. 8. dispof. esteems as fabulous, yet when as the Philosopher affirms that he saw it with his eyes (as l. 1. de gen. anim. c. 16. & 9. Hist. c. 41. it is evident) I am wholly of his opinion, and do give full suffrage to his assertion. But how after copulation, they grow and come to maturity, we may know of *Arist.* Hist. 9. c. 41. and *Pliny* his Interpreter. The master Wasps, when they have chosen them a convenient place under ground, in the chinks of walls, or (which I have often seen) in the thatch of houses; in the beginning of summer they make their nests, and they contrive their little nests or cells (which the Greeks call σφηκοίς) with 4 doors or passages, in which are begotten worms only, not Wasps, which when they are grown up, then they make larger cells, and when they come to have young ones, then they make more still, so that at the latter end of Autumn, you have many and large nests builded; in which the chieftain or master Wasp (which is called the Matrix) procreates no more Wasps, but those of his own sex; which also are begotten aloft in the uppermost part of the nest, in the likeness of worms, but far bigger than the other, in four or more cells continued, or joyned one to another, otherwise there would be no difference in their breeding, between the Master or nobler sort, and the ordinary Wasp. They let fall their sperm as the Bee doth at the sides of the cells of the comb, and shove them close to the walls or outmost part. It is not all alike in all cells, nor of equal bigness, but in some un-

L. 11. c. 21.

equall and strange (saith *Pliny*). In some so big that they are able to fly: in others only Nymphs, covered with a thin membrane like an *Aurelia*: some also have them yet in the worm. The Worms only have excretion in like manner as the Bees have. Their sperm or spawn doth not stir at all while it is in the Nymph, and is covered with a membrane. In the same time of the year, and the same very day you shall observe them to be of unequal growth, one flies abroad, another is only a Nymph; one is able to roole or tumble, another not able to stir, a third is a little worm. All these things happen in the Autumn, not in the Spring. They most increase at the time of the full Moon. Here then is to be noted, that the Wasps have no swarms, and that all the Summer they are governed by their Masters or male Wasps, but in the Winter by their females. Afterwards the multitude of their issue being renewed, the government such as it is, of short continuance and weak, however, upheld with most just lawes, returns to the males. But yet notwithstanding their young seems not to be brought forth by way of Birth, saith *Arist.* (because it presently becomes bigger than a Wasp should be able to bring forth.) A very sterile and empty conceit of so renowned a Philosopher. For what should hinder that Nature should not be able as quickly to perfect and increase that which is produced by a legitimate birth, as that which is generated of putrefaction? Let us but call to minde the young ones of fowles, which in a very short time when they are once out of the shell, do get feathers on their backs; how soon do they go, feed, grow, and come to maturity? and then we shall easily see the weakness and improbability of the Philosophers Argument. The Master Wasps are greatly increased in number, especially if there were great store of Wasps, and a wet year the year before. *Aristot.*

The Worms before they become Nymphs, i. e. young Wasps, are somewhat long, like those that breed in flesh (which *Hippocrates* calls *luxa*) and small nirs, whitish, full of dints or wreathes, toward the tail thicker, with a blackish streak all over the back, without feet, not creeping, but as it were tumbling up and down and moving themselves from one place to another. When they

they

they have layed their young fry, they cover the cell with a kinde of a little thin skin, as it were, which when they come to perfection they break, and two daies after fly about with wings. *Aristotle* mentions but two kinds of Wasps, one milde, the other fierce; the fierce kinde is very rare, and breed in mountains and woods, and breeds not under the ground, but in an oak, being greater, more stretched out, blacker, longer, having a stronger sting, and stingerth more fiercely than the milder do, and is armed with a greater sting than his body seems to be able to carry. *Aristotle* saith that they live till they be two years old, and when the tree is lopt, in the winter they are seen to fly away. They lye close all the winter, and most commonly live in old walls or trees.

A sort of these I found once in a wood in *Essex*, not without great peril of my life, at such time as by chance I carelessly wandered here and there a simpling, with my friend *Penny* and one servant attending us. I would needs be prying into their nest: with which they being offended, all the swarm flusht out upon us with all the force they had; and but (as God would have it) we had carried in our hands some sprigs of Broom, (with which we used to catch those Insects) for our safeguard and defence, we had payed for our folly, not only with the hazzard of safety but of our lives; for they followed us hard to the very middle of the wood, and a great while it was before they would leave pursuing us.

In the year 1582. on the top of *Chartmell* hills amongst the stones I saw two sorts of Wasps very eagerly fighting with one another, no difference there was but in bigness. The greater they stood upon their strength, the less trusted in their faction and multitude; for six of the lesser fought with one of the greater, not in the air, but in the grasse. From whence I gather that the greater did use to rob the less of their honey or young ones, or perchance offer them some other injury. Long and sharp was the fight, so that scarce after two or three whole hours encounter, and the Sun very vehemently shining and scorching them, did they give over. For they are very hot upon revenge, and long ere they take up the quarrel: so boldly and furiously charging the enemy, that even *Mars* himself were not able to answer them, or match their valour; such a strong undaunted nature hath God instilled into them, and such spiritlike courage hath Nature planted in them. I once received from *Vienna* and *Hungary* two kinds of Wasps, such as you see in the Figure, their backs were variously coloured with a shining yellow black colour, the one had rough horns, the other smooth; both of them almost three times as big as the ordinary sort of Wasps.

The Wasps called *Ichneumones*, are less then the rest: they kill Spiders called *Phalangia*, and after they have done they carry them into their nests, and dawb them over with dirt, and so sitting upon them do procreate their own species. *Aristot.* Therefore they are called *Ichneumones* saith *Niphus* from their spareness and slenderness.

This kinde of Wasp I make to be all one with that spoken of before, building her nest in mud-walls, and such like places; before the entry or going into her hole she builds a porch of dirt, the length of it about the breadth of two fingers, which within is emplastered over with smooth plaister of the same dirt. *Pseudospheca* seemeth also to be a kinde of Wasp having no sting,

with a blackish head, having two cornicles or little short horns, great eyes, black, standing out of its head, a long forked mouth, a bulky breast strutting out, to which on either side are three feet fastened, the shoulders thick and bunching out, the body long, slender, consisting of many joynts, two dusky coloured wings, rough feet, and of the same colour with the wings. There is a kinde of Wasp called *Laerta*, because it stings deadly, like the Pismire so called. *Parnopes*, are a kinde of Wasp so called, which eateth grapes, (as *Aristophanes* relates) and serves for a prey to the Owls and Screech-owls, as *Ælian* saith.

Of the Wasps as well wilde as tame, some have no sting, (or at least make use of none) others have; the lesser and more feeble are those that want, which neither are able to offend or defend. On the other side, they that have stings, are bigger, stronger, and able to fight. These, some would have to be the Males, the other that have no sting Females. Also very many of them that have stings are conceived to lose them upon the approach of winter. But this as yet hath not been my chance to see (saith the Philosopher). If you take a Wasp and hold him up and make him buz, those that have not stings do presently flock to him, which those that have do not; which is the argument whereby some are to prove, the one to be male, the other female. Of both sorts some are observed to couple together as the fly doth. Moreover, (according to their sex) both kinds of them are divided into two sorts, either they are master Wasps, or drudges and labouring Wasps; the one is greater and more gentle, the other less and more pettish. The drudge or labouring Wasp doth not live out a whole year,

ixrai.

Hist. 9. c. 41.

year, for in the midst of winter they all die; which is known, because so soon as winter comes they grow stupid, and in winter there are none to be seen: the others, that is to say, the Lady Wasps, are observed to hide themselves all the winter long underground. For divers men when they have gone to plow or dig in the winter, have seen them, though no man ever saw the other.

Now the Female Wasp is broader, weightier, thicker and bigger than the Male Wasp, and but slow of flight; for by reason of the weight of her body she is not able to fly far; by which it comes to pass that they for the most part sit at home, making of a certain glutinous material which the labouring Wasps bring to them, combs and cells.

No man ever observed these creatures to live long, for the longest lived, which are the Matrices, female or lady Wasps, live not above two years at the most, the other die every Autumn. Now whether or no the Female Wasps of the former year, after they have brought forth another brood of master Wasps, die together with the young Wasps, or whether it alwaies fall out to be so, or whether or no they can possibly live any longer time, many Authors leave undetermined. But the wilde Wasp is accounted to be longer lived than the tame, the reason is because those making their nests commonly by the highway side (from whence they are called *épistas*, by *Hom. i. e. Highway dwellers*) are necessarily exposed to divers injuries, which hasten them to their death. And yet that little time that they live, is made up in the strength of it. For if you take them off at the head, and so again at the breast, they will continue a great while after, and putting forth their sting, will as shrewdly hurt any man that shall touch them as if they never had been pulled in sunder, or were alive as before. *Gullerinus* in his book of Shell-fish, writes very confidently that they put off their shells and renew their old age every year: certainly (unless he dreams waking what he would have to be) this must needs be discovered sometime or other in their Nests.

Their Age,

Apollonius calls them *απολόγους*, *Aristot. l. 11. c. 53. μολοβους*, although they feed not on raw flesh only and ripe Apples, but upon Pears, Prunes, Grapes, Flowers, and sundry sorts of fruits; also on the sap of Elms, Sugar, Honey, and almost whatever. They feed on flesh of Serpents, and then they sting mortally. They hunt after the greater Flies, and spare not the harmlesse Bees, who do so well deserve of the Common-wealth of mankind.

Their Food,

According to the nature of the place they live in, they differ both in shape of body and disposition of minde; the trivial and ordinary Wasp being accustomed to the company of men and cattel, do seem to be more milde of nature; but those that live in woods and solitudes are more fierce; yea, insomuch that *Nicander* in one word calls them *ὀλοαί, i. e. perniciosas*, pernicious and destructive. There are also, as *Ovidius* affirms, in hotter Regions, those that are more hurtful then others, as in the *West-Indies*, whereas they differ from those of these parts both in bigness and shape, so also in their venome. For so are they reported to be far more deadly then the *English, French, yea or the Spanish or Barbary Wasps*: such as these also, *Olaus Magnus* in his 22 Book, saith, are very frequent in some very cold countreys.

The place of

The use or benefit of Wasps is observed to be divers; for besides that they serve for food for Castrels, Martins, Swallowes, Owls, Badgers, Chameleons, they are also many waies profitable to men, for they kill *Phalangium* the most venomous kinde of Spider, and they themselves are a plaister for their own stings. The *Pseudosphe* or wilde Wasp (especially that which is taken in the beginning of that year) being taken into the left hand and there held fast, *Pliny* commenderth for an excellent remedy against a Quartan Fever, *l. 30. c. 11. Miraldus* attributes much vertue to the distilled water of common Wasps, or decocted, for raising of a tumor in the place that is washt with it; applied to the belly it makes it swell as if it had the Dropsie, by which trick whores use to perswade their sweethearts that they are with childe by them; and by this way also they deceive many times very cunning and expert midwives. *Mirald. Memor. cent. 7.* from whence it may be concluded that their venome is exceeding hot and inflative.

The use of the

The Fox also (a subtile creature) is said to prey upon the Wasps, on this manner; he puts his tail into the Wasps nest so long till it be all covered with Wasps, which he espying, pulls it out and beats them against the next stone or tree he meets withall till they be all dead, this being done again and again till all the Wasps be destroyed, he sets upon their combs and devours them. *Alian.*

But men pursue and destroy them with other cunning. As thus, in the meantime that the labouring or working Wasps flee to the Elm, which useth to be in the Solstice or at Midsummer, to gather some gums material to work withall: the master Wasps remain in the Nest and sit upon their young, those they smother with the stinking vapour of Sulphur, Garlick, Reed, or such like; and throwing down their combs kill them with hunger. Now when they would preserve their Bees from being surprised by the Wasps, they set by the Hives side a pot with some little pieces of flesh in it: into which when the Wasps in hope of prey are entred, they sudden-whelm the lid of the pot upon them and kill them; or else putting hot water in at a hole scald them to death. Others hang a net before their Nests over a small Menow. Now the Wasps being drawn by a natural and strange sympathy to the Menow (for no food more takes them than that) they are presently involved in the net, and so caught, and with casting on hot water are killed. *Alian.* As also they lightly spurt out of their mouthes oyl upon the grapes, fruits, sugar,

honey,

honey, &c. which causeth them either to fly away, or tasting the oyl, to die; sometimes they mingle corrosives with honey (as Mercury sublimed, Vitriol, Orpiment, &c.) which when they take, eats out their bowels, and so they pay well for their gluttony and intemperance.

Tetrab. 4. ferm.
1. c. 11.

Now if at any time by reason of the stinging of Wasps, there arise pain, perturbation, swelling, redness, heat, nausea, and thirst; and not long after swooning (which happens when they have poisoned their stings with feeding on venomous herbs, and Serpents flesh) Physicians have found out a preservative and remedy whereby to repell their stings and easily cure them. The virtue of Mallowses, and Marsh-mallows is excellent against the stinging of Wasps. Thus the most soft and supple herb becomes a remedy against the most warlike and injurious creature, with whose juice and a little oyl mingled with it, and the part anointed, doth either mitigate the rage of the Wasp, or doth not suffer the sting to enter, *Plin. l. 22. c. 179.* So *Avicenna*, the Wasp, saith he, will not come near any man that is anointed with oyl and the juice of Mallowses; for as a soft answer appeaseth wrath, and (as the Greeks use to say) ἡδὺς μίχιστον ἐστὶν ὀργῆς φάρμακον λόγος, i. e. A milde reply is the best allay to anger: so also in physicks we see those things that are most fluffe and unyeelding, to be relitted and beaten off with the most soft things, as the Iron with feathers, the Adamant with bloud, the sting of Wasps, Hornets, Bees, with oyl and the juice of Mallowses. What is more soft than the *Silk-worm*? which yet *Aetius* affirmeth being beaten together with oyl and the party anointed with it, is a preservative against the stinging of Wasps; the same doth the Locust and the herb Balm beaten together with oyl, if the Greeks may be credited. The stone *Garratides*, if it be the true, although dawbed over with honey, and born about, doth fray away all Flies and Wasps whatsoever, as *Sylvaticus* out of *Albertus* doth conjecture. The like virtue doth *Matthioli* ascribe superstitiously, and too confidently, to the Iron that hath the figure of the shell-fish *Strombus* graven in it.

The symptoms that follow upon the stinging of Wasps, are said to be these; they suffer all alike as those that are stung with Bees, to wit, smart, redness, swelling, but the pain is more grievous and of longer continuance, especially if they chance to be stung by the citron coloured greater Wasps, in a sinewy and tender place, for then follows the cramp, weakness of knees, swooning, and sometimes death.

Remedies a-
gainst the
stings of
Wasps.

Physicians have found out many remedies against the stings of Wasps; we shall first speak of those we have tryed and which may challenge your acceptance, being confirmed by long experience. We finde that Wasps applyed to the wound they made do exceedingly help it, being perswaded to use them by *Gilbert* an English man. It may be that not the Scorpion only hath this vertue, but the greatest part of Insects have it also, if we should make trial diligently. But if any man be stung by venomous Wasps, (which is easily known by the wound of the part, by raving and swooning, and coldness of the extreme parts) then give antidotes against venome, and open the place with a knife, or rather lay on a cautick; when it is laid open and dilated, suck it forcibly, and taking some of the earth of the Wasps nest, make a plaister with vinegar, and lay it on the sore. Also a Cataplasme made of Mallowses, Willows and Wasps combs helps wonderfully, as we proved by the counsel of *Halyabbas*. The North English men make a good plaister against the stinging of Wasps, of the earth of furnaces, vinegar and flies heads; it is worth its weight in gold. Rub the place with juice of Citrals, and let the patient drink Marjoram-seed 2 drams: or take juice of Marjoram 2 ounces, bole Armoniack 2 drams, with juice of sowre Grapes what may suffice; make a plaister. Another; anoint the place with the juice of Purslain or Beets, or with sweet Wine and oyl of Roses, or Cowes bloud, also with seeds of wilde Cucumers bruised with Wine. *Galen*. Barley meal with Vinegar is good; milk of the Fig-tree dropt into the wound, Brine or sea-water to foment the wound; give in drink 2 drams of the tender leaves of the Bay-tree in sharp Wine, which also will do much good in a fomentation. Also drink the decoction of Marsh-mallows with *Posca*: apply Salt and Calves fat. Mallowses with *Posca* is a principal remedy. *Dioscorid. l. 2. c. 42.* *Aetius* joyns an earth named *Cimolia* to these, and Clay, and Oxe-dung, and *Sesamum*, and many other things with *Posca*. Oyl of Bayes drawes out the poyson of the sting of a Wasp. Leaves of Marsh-mallows bruised and rubbed on, cure the venome of Wasps. Drink a little measure of the juice of Rue or of Balm, with Wine: and the leaves eaten, and applyed with Salt and Honey, or boyled with Vinegar and Pitch, are very good. Water-mints, Rosemary, with Barley-meal and *Posca*, juice of Ivy-leaves, Golden flower, and Owles bloud, are excellent against the stings of Wasps. *Pliny l. 32. c. 9.* *Galen* praiseth Water-mints and the seed of it drank, and Centaury, if at the same time you lay on Oxe dung for a plaister. *Lib. de simplicib. ad Paterianum. & lib. de Centaur. ad Papiam.* A branch of the wilde Palm-tree, Endive root, and all wilde Betony, laid on for a plaister, profit very much. Also drink wilde Betony 2 drams with Oxymel. First, suck out the poyson, then hold the part hurt in hot water for an hour, then steep it suddenly in Vinegar and fish-Pickle, so the pain is presently gone, and the swelling sinks away, and the venome is pacified. One half dram of Marjoram seed applied stills the pain, or 3 pugils of dry Coriander seed, or cool juice drank. *Avicenna*. Leaves of Nightshade or Houseleek laid on are good. Also bole Armoniack with Camphire and Vinegar. Nuts bruised with a little Vinegar and Castoreum: apply a honey comb, and presently hold the part affected to the fire, or put hot ashes under it, and the pain will cease forthwith. It is good to lay on green Coriander, or oyl and ashes mingled. *Rhassus*. Savorey or Water-mints applied, and the seed of them drank, or the juice of the lesser Centory drank in Wine is excellent. So are the leaves of river Basil, Mercury,

Man-

Mandragora with Vinegar. *Serapio*. A snow ball put to the fundament takes off all pain, chiefly if it proceed from a Wasps stinging: foment the part with Camphire & Vinegar, or oftentimes with snow-water. Take Opium, Henbane-seed, Camphire, of each alike, mix them with Rosewater or juice of Willows, and apply it, lay over it a cloth wet in Wine. *Ardoynus*. Take juice of wilde Mints *Aurei* 2. with juice of sowre Lemmons, make a julep. Also the juice of the *Arabian* Thorn, and of *Marjoram* help much. *Mesue*. Water-lintels with Vinegar anointed. *Aaron*. Rub the part well with the finest leaves of *Xylocaraster*, that is, sweet Cods of *Pliny*, and the pain presently ceaseth. The juice of Lettice doth the same, or the juice of *Dandelion* drank. The Mud in the bottom of a vessel where water hath stood long, applyed with Vinegar, cures the Wasps stinging. *Simeon*. Foment the part with Snow-water till it be stupefied. *Joannitus*. Any new earth, especially *Cimolia* is good: *Poly* smeered on, as also Goats milk, cures Wasps wounds. *Arnoldus*. *Alcanna* with Barley meal, and Vinegar, bound to the part, Nuts, the leaves of Walnuts, Blites, are very good; also lay on hot to the wound a Spiders web beaten with a white Onion and Vinegar, it cures. *Constantinus*. Rub the place with Sage and Vinegar, and after with *Posca*. *Guil. Placentinus*. Lay iron on the part, or Lead steeped in Vinegar. *Gordonius*. Apply Chalk in powder, and drink Mallows seed in Wine and a little Vinegar boyled together. *Varignana*. His Bezoar is Coriander taken with Sugar. *Christophorus Probus*, commonly called *Honeste Nonius*, commends Balm leaves bruised with *Posca* or with Oyl and applied. *Nonius*. *Sparagus* bruised with Honey and smeered on, Flies bearen and laid on, Savory, wilde Mints, oyl of *Momordica* anointed, cure. *Matthiolus* commends Oxe dung laid on. *Marcellus*. Any man may finde these and a great many such like receipts, the storehouse of Nature and of Physicians affords infinite remedies and antidotes innumerable to your hand every where. The Remedies for Bees and Wasps stings are the same, only that one requires them somewhat stronger than the other. In the year 190. before the Birth of Christ, as *Julius* witnesseth, an infinite multitude of Wasps flew into the Market at *Capua*, and sate in the Temple of *Mars*, they were with great diligence taken and burnt solemnly, yet they did foreshew the coming of the enemy and the burning of the City.

CHAP. IX.

Of Hornets and the Tenthredo.

They are called in the Hebrew, *Tsir dah*; in Arabick, *Zabor*, *Zambor*; in the German tongue, *ein Hornauffs horlits* *Isroisen pferzwunble*; in Brabant, *Horsele*; in French, *Fressons*, *fressons*, *foulons*; in Italian, *Colanroni*, *Crabrone*, *Scaraffon*, *Galanron*; in Spanish, *Tabarros* or *moscordos*; in the Slavonian tongue, *Sierlern*; in Illyrian, *Irssen*; in English, *Hornets*, *Great Wasps*; Hungarian, *Lo Daras*.

The Greeks call them *αὐτοπύρας* & *αὐτοπύρας*; because with their sting they raise a Carbuncle. They are called in Latine *Crabrones*, perchance from the Village *Crabra* in the Countrey of *Tusculum*, (where there are great store of them) or from the word *Caballus*, i. e. a Horse, who is said to be their father. According to that of *Ovid. Met. 15.*

*The warlike Horse if buried under ground,
Shortly a brood of Hornets will be found.*

Albertus calls it a yellow Bee. *Cardanus* will needs have them to arise from the dead Mule. *Plutarch* in the life of *Cleomedes*, saith they come out of Horse flesh, as the Bees do out of the Oxe his paunch. Now whereas they are more melancholy and sullen then the Wasp, why should I not with *Virgil* say that they are produced of the Ass? whom we have seen not only to fight with the Horse, (when as the female or the Ass would be backt) but also to chase and overcome him oftentimes. I conceive that those are produced of the harder flesh of the Horse, and the Wasps of the more tender flesh.

The Hornet is twice as big as the Wasp, and very like it in shape; they have four wings, Their Description. whereof the two undermost are twice as little as the upper or outermost, the which are fastened to the shoulders, being of a dark brown and Chestnut colour, and with which they fly very swiftly. Six feet they have of the same colour with their breast and shoulders, their head long, of a yellow hew: their eyes hanging out in fashion like a half Moon, between which grow two horns like a sickle or reaping-hook of the same colour with the feet. The belly is made fast to the shoulders with a small thread; of which the one half is of a duskie colour, and begirt with a girdle of Saffron colour: the other half seems to be all Saffron colour, set with five dark colour specks, together with a small triangle, having moreover on both sides of them certain joynts, by which they can contract or extend themselves at pleasure. On both sides of the belly they have four black spots, and their tayle is armed with a long, stiffe and exceeding venomous sting. As they fly they make a murmuring and humming noise, far more hoarse than the Wasp. Who notwithstanding they are gregal or hearing creatures, are fierce and cholerick, and alwaies of a wilde nature, nor (like wilde plants) do they admit of any taming: of such malignity are they that with

Their place
and dwelling.

Habitation.

L. 11. c. 21.

twenty seven strokes they will kill a Man, or a Horse, especially in the Dog-däies, at which time their nature is more hot; and men are more weak by reason of the abundant exhalation of the spirits. No wonder then that in sacred Writ they are compared to most cruel enemies, *Exod. 23. 28.* So *Ovid Metamorph. 11. Spicula Crabrenum ardentia*, the fiery darts of the Wasp. And *Virgil* in the 4 of his *Georgicks* calls them *asprissima*, very sharp. *Terence* in his *Phormio*: *Plautus* in his *Amphitryo* use that Proverb, *Irritavi Crabrones*, I have stirred up a Hornet, to shew the nature of women when they are angry, the more you strive with them, the more you provoke them, and at length go by the worst. Now as amongst Bees both the Drones and the Kings or Master-bees have no sting, and also some Wasps, (as we have said before) so amongst the Hornets there is not one but hath, both those that are in trees and those that are in the ground, not so much as the Captain or Master Hornet but hath one. For the Hornets as well as the Bees and Wasps have their Commanders or Master Hornets, what ever *Pliny l. 21. c. 11.* dreamt to the contrary; only they are bigger than the rest according to the proportion of Hornets to Hornets, then Wasps are to Wasps, or Bees to Bees. They do also remain within doors as the Master Wasps do, but they never breed but one Master Hornet of them in a Nest, for fear of tumults and taking of parties; but as they are very troublesome, and farall to those that from without annoy them and seek to spoyle them, so they are very strict in preserving domestick peace and quiet, and in keeping of mutual society one with another, and in providing for their young they do even outstrip the Bees themselves; for they never quarrel about priority of place, nor distract them with diversity of employments, nor make a stir or tumult about the election of their Chieftain or Master Hornet, but all have one and the same employment, and they all diet together, whatsoever prey they take, or small creature they kill abroad, they carry part of it home to their fellows, and young ones.

Neither do they every year send out and expose to the wide world their young ones as the Bees do (and for which they are censured as in that respect unnatural) to finde out an harbour where they can for themselves to dwell in: but all their new brood they nourish and bring up in their own bosome, and as need shall require build more and bigger nests to keep them in. As for their King or Master Hornet (whom also they dearly love and respect) such a one they have that doth appear not to want power to command, but occasion to exercise it. Only he excels the rest in courage of minde and bignesse of body (as it is usual for Princes to do) for he is more fierce than any of the rest when he is to encounter with foreign enemies, as he is on the other hand most milde and gentle to his subjects at home.

The Hornets make their nests under ground: casting up the mould as the Pismires do. For neither they nor the Wasps send out young swarms as the Bees do (as is before said) but as the young are bred there they remain, and so they dig their nests bigger and bigger, as the family growes greater and greater. They make their nests exceeding large; we took 3 or 4 baskets full of combs of the lustier brood: they have very little or no honey in their cells; a drop or so where their young are.

If any of them chance to wander from their nest, they gather themselves together into some tree, and there make their combs in the top, which oftentimes are easie to be seen, in which they procreate one King or Master Hornet, who when he is grown up, leads away the whole troop and provides them a nest with himself.

The wood or wilde Hornet (saith *Pliny*) live in hollow trees all the winter, like other Insects they lie hid, they live not above two years. Their sting is seldome without a feaver, causeth a carbuncle tumor, and exceeding great pain. They build their Nests far more artificially than either the Bee or Wasp, sometimes in the hollow trunks of trees, or else under their roots in the ground, which they make bigger and bigger according as their family increaseth, and curiously plaister over with a kinde of slimy spittle gathered from gummy leaves. The mowthes or passages of their cells are never upward, but altogether downward; and they very providently place the bottom of their cells upwards, that the rain may not pierce through them, or lest otherwise they should be exposed to the extremity of wind and weather were the head above. All their nests in a manner are exactly 6 square, the front or outside whereof is beset with white and rusty iron coloured segments; the matter of them is membranous, much like pieces of Beech-bark, when it is roll'd together and shrivel'd up with heat. Whilest *Penninus* was at *Peterborough* in *England*, he saw in the wide and open street a Hornet pursuing a Sparrow, whom when he wounded with his sting he fell down dead to the ground, and with the admiration of all that beheld them, he suck't out and fill'd himself with the blood of the slain prey.

Concerning the Copulation of Hornets *Arist.* knew nothing of certainty, as neither from whence nor how they are bred. But for as much as they do for certain lay their young at the very sides of their cells, as Bees and Wasps do, it should seem after the same manner they bring them forth. But if they do couple, they do it in the night, as Cats do, or in some se-

cret places, out of all possibility of being seen; where *Argus* himself should not espie them.

The Hornet doth not feed on flowers, but lives for the most part on flesh: and rather than fail, oftentimes they will stoop to dung and excrements. They hunt after great flies also and the smaller birds, which when they take, they first wound the head as the Hawk doth, and then pluck it off and fly away with the rest of the body. In the winter they die many of them: because they do not as the Bee, lay up provision beforehand, but only live from hand to mouth, regarding nothing but their present necessity. *Arist. l. 5. Hist.* Moreover, as *Laudius* observes, they watch about the Bee Hives, and getting on their backs use them in stead of a Coach or Chariot to carry them; for when the poor wretches strive to fly away, they carry a most cruel rider on their backs, who when he hath sucked out all the juice that is in the Bees body, is the most ungrateful of all winged creatures, he kills and eats up him which supplied his hunger. Also all sweet things whatsoever the Hornet will feed on: insomuch that I have seen him with mine own eyes to eat of grasse worms. But the *Indian* Hornets have such a vast appetite (as *Ovidius* witnesseth) that they will light upon Oyl, Butter, Cakes, Sawce, and all liquid things whatsoever; not sparing napkins or table-clothes, which they will conspurcate and defile with their filthy excrement, and laying of their slimy eggs. Now as they feed upon what they got from others, so they do not want one to prey upon them likewise. Above the rest the Brock, who about the full of the Moon enters their dens or nests and destroys both house and family. Nor are they food for this useful fat creature only, but they serve the countrey men by way of prognostick, to foreshew the alteration of weather; for if toward the evening they are seen to fly about in greater store than ordinarily they are wont to do, it is a sign that the next day will be fair and hot: but if about twilight they often enter into their nests as it were to hide and shelter themselves, then expect rain, winds, and stormy weather to ensue. Upon which *Avienus* thus:

*So when you see troops of boarse Hornets fly,
Late at the end of Autumn, they foreshew,
When first Virgilius stirs the evening skie,
That storms at sea shall presently ensue.*

Moreover whereas the same Medicines that cure the stinging of Wasps, will prevail also against the stinging of Hornets: yet as *Aggregator* hath taught us, a Hornet is the Bezoar stone for its own wound laid on with *Posca*, Oyl, or Oxe dung; Also Bole, and all fat earths are commended, such as *Bacchus* applied to bald *Silenus*, who was stung with Hornets, whilest he rifled their nest for honey supposing they were Bees: *Ovid.* describes it neatly in 3 *Fastor*:

*Thousands of Hornets his bald pate torment,
And with their stings they wound his ugly faces;
He falls, and cries for help, a foul disgrace;
What remedy, it was too late for to repent.*

*When that the Satyrs came, & found poor Silenus,
His face all swoln, and halting on his knee,
They could not choose but laugh, Bacchus said thus,
Noint it with Mud, it prov'd a remedy.*

He that desires more remedies against the sting of the Hornet, may finde of them plenty in the story of the Wasp. For Authors do seem to make them all one, only with this difference, that in this case they ought to be given in greater quantity, and the use and application of them longer continued.

Now let us proceed to the Insect called *Tenthredo*.

Whether it ought to be called *τενθρήδων*, *τενθρήδων*, & *τενθρήνη* according to *Aristotle*, or *πεμφρήδων* according to *Nicander*, let Philosophers judge; they seem to me to differ only in name and bignesse. For whereas the Scholiast of *Nicander* calls it *insectum σφηκώδες*, an Insect like a Wasp, I do not weigh that, when as ever and anon, by Poetical licence, he calls the Wasp, *apem Croceam*, a yellow Bee. What name it hath in other nations I know not, and (to say the truth) nor know I the little Beast it self. Only this I finde, that Authors describe it to be in colour like a Wasp, like a Bee in bulk or bigness, and in communication of labour like all other social winged Insects. He is very sawcy, loves the kitchin well and fish, insomuch that some think it should be written *τενθρήδων* in stead of *τενθρήδων* and *τῆς τενορίας*, because it is given so much to Licorishnesse. *Hesychius* calls it *ἀγρίαν μίλισσαν*, a wood or wilde Bee. *Hermolaus* thinks they should rather be called *ἀρθρηδῶνες* or *ἀνθρηδῶνες*, rather than *τενθρήδῶνες*, as he saith it is corruptly read in *Aristotle*: He makes his nest in the ground as the Wasp doth, with many rooms very large and handsome. *Pemphredon* will not by any means yeeld that the *Pemphredo* should be the same with *Tenthredo*. For the *Pemphredo* (as the Scholiast of *Nicander* describeth it) *ἔσθ' ἐστὶ παραπλήσιον μίλισσῃ, ἀλλὰ ἢ τενθρήδων σφήκι, i. e.* the *Pemphredo* is very like the Bee, but the *Tenthredo* like the Wasp. But yet notwithstanding the Scholiast forgets himself; who writes also of the *Pemphredo* after this manner: *Pemphredo* is an Insect like a Wasp, it hath a sting, is greater than a Pismire, but lesse than a Bee; it hath wings, and a various colour tending to black; in fair weather it gathers sustenance from the shrubs in the valleys, then it flies and laies it up in the hollow oaks.

This Insect haunter woods and mountains, gathers honey juice from flowers, and layeth it up

in a hollow oak as being his Repository for the sustentation of his life ; but honey he makes none, wherefore they differ in no other thing but in bignesse ; rightly termed of the Poet, *Parvula Pemphredo*, i. e. a small *Pemphredo* : as degenerating only and especially by that mark from the *Tenthredo*. Of winged Pismires, we shall speak in the Chapter of Ants. And this shall be sufficient hitherto to be spoken of winged Insects, such as are social and live together. Now we shall bend our discourse to speak of winged solitary Insects, or such as live severally by themselves.

Amongst these solitary ones, some there are that have nests, as the young Drone called *Siren*, the Drone called *Bombylius*, and the *Bombyx* ; others that have no nests, as the Fly, the Gnat, the Butterfly, the Moth, the flying Glow-worm. Those that build nests, are the *Sirenes* of both kinds, so called by *Eustathius*, ἐν σπηραδὶ πνέει φωνὴν ἔχει, i. e. because they seem to have a kinde of articulate or significant voice, or perhaps as that sea Monster, καὶ τὸ σείζει, because with his pleasant noise and buzzing he doth as it were tickle and charme the ear ; and not unfitly καὶ τὸ σείει, because they beat and flutter in the air with their wings.

Of the *Sirens* there are two sorts, the one lesse all of a duskie colour ; the other bigger black mixt with other colours. This sort *Pennius* referreth to the species of the Wasp, and so he describeth it in his drafts. All the body black, except the back, which is reddish from the middle almost to the tail, the extremity of which being black, hath silver coloured wings affixed, the former twice as big as the other : they harbour in wals, and in the brinks of ditches, and ruinous buildings ; whether they have any sting, or no I know not.

The *Bombyx* is so called καὶ τὸ βέμειν, because they never flye but they whirle and turn round in their flight : whence the Greeks call *Topps* or *Wheels*, βέμειν. It is a creature resembling the Wasp, of a black hue, having a sting like as the Wasp hath, but stinging so deadly, and with such force, that it leaves the weapon in the wound. As a remedy to this *Nicander* commends the Pine tree Gum, and the unctuous honey of the *Tenthredo*. *Parmeni* in his *Iambicks* makes mention of this creature, which in the time of vintage useth to eat the ripe Grapes. Another of this sort is found in *Assyria*, but of greater bulk. Some of them build their nests spire wise out of clay like to glasse or salt, fastening them to a stone or such like thing, but so hard and thick that you can scarce pierce them with a dart. For these they lay and bring forth little white worms, covered over with a black membrane ; in another membrane they make wax in clay, much paler in colour and in greater plenty than the Bees. So *Aristotle* and *Pliny*. Who indeed were very sparing in their relations concerning the *Tenthredo*, *Bombyx*, and Humble Bee ; either because their nature was not so well known to the generality of the Grecians, or rather because they themselves were not so well vers'd in their History.

The *Bombylius*, greatest of the nestling Insects, is bigger than either of the *Sirens* (spoken of before) he hath his name from the humming noyse he makes : for the word βομβυλίζειν signifieth as much, to make a humming or buzzing noise : for which cause he is called by the Germans *Hummel* or *Humlen*, in English a *Humble Bee*, as you would say a sounding Bee, the name being taken from the noyse they make : from whence (as the learned *Turnebus* notes) the long pipes are called *Bombyces* from the humming sound they give.

Pollux calls these πονδισκίδες αὐλῆς, and *Theophrastus* calls a reed fit for these kindes of pipes βομβυλίας.

They are of little or no use. Insomuch that the Greeks use to call an idle unprofitable man, βομβυλίων ἄνθρωπος, i. e. a man no better than a Humble Bee ; for such is this kinde of Bee, even of no use at all. Nevertheless one *Antisocraticus*, to shew his wit, hath taken a great deal of pains to set forth the commendations of it. A cup with a wide mouth making a great noise as they drank, was in great request with the Ancients ; that so, not only the brain might be intoxicated with the liquor, but the ears also with the greatnesse of the noise. They breed under stones hard to the ground, they build their nests sometimes with two doors, sometimes with three ; in which there is found a beginning of a certain course Honey, and that (as *Albertus* relates, and *Pennius* saw) not of any great quantity ; who once found so much as he could scarce hold in three handfuls. The English Humble Bees have not all stings, only some few of them, but those that have do sting grievously ; the honey they make is not very sweet, and withall some what waterish. They fasten their wax as the Bees do to their hinder legs : they couple tail to tail, in the mean while holding fast by some plant or tree, they continue long in the act of venery, and all the time clapping with their wings they make a harsh noise, as if they were singing a Bridal song.

Ἐν τῇ πύρρῃ
βομβυλίων.

CHAP. X.

Of Flies.

IN Hebrew, *Zebub*; in Arabick, *Dubene*, *Aldubel*; in Illyrian, *Muscha*; in Spanish and Italian, *Mosca*; in French, *Mousche*; in High Dutch, *Flieg m'uck*; in Low Dutch, *Uliegh mugge*; in English, a *Fly*, from flying or scaping away, for it signifies both; in Scottish, *Flee*; in Greek, *μύια* and *τὴ μύειν*, that is, *to suck deeply*, or *to mutter*, the Fly doth both. Latine, *Musca*.

Not as proceeding from *Muscus Moss*, as some do fondly dream, but from *Musculus* a muscle; for taking off his wings you shall see that his head is full of sinewes, his body soft, his tail tendinous. Hence the diminutive *muscula* in *Boethius*, who thus elegantly cries out, *Quid homine imbecillius quem morsus muscularum necat?* VVhat so frail as man whom the smallest Fly is able to bite to death?

Now the frame both of its body and minde we describe thus out of *Lucian* and others. The Description: great Fly is the least of winged Insects, insomuch that it may be compared to the least Fly or Flee: only he is so much bigger than they, as the Bee is bigger than he.

It hath wings, not such as other things that flie have, but made of little skins as the Locusts, Grasshoppers and Bees are, but a very great deal softer, as an *Indian* Garment is softer than those of *Greece*. If any man observe the Fly when he opens his wings in the Sun, he may perceive them painted with variety of colours, as the Peacocks are. He doth not flie straight forward, as the Bats do; nor skipping as the Locusts, nor making a noyse as the *VVasp*; but winding in and out to what part of the air soever he pleaseth to move himself. Neither doth he flie quietly and in silence but with singing and melody; not so hard hearted and cruel as the gnat or little Flies, not as Bees and Wasps with a grave harshnesse, making a horrible and terrible murmuring: yea so far doth the Fly exceed all these in sweetness of sound as he flieth, as the small Pipe doth the Trumpet and Cymbal, or as still musick is sweeter then the loud.

He hath a very little head bound to his neck, turning every way, not compacted and fastened to his shoulders as the Locusts is. His eyes stand out very much, shining as if set in horn. His breast is very firm and well compacted. He hath six feet growing out of his body, not as the Wasps fast bound or tyed to it; he goeth only with four of them, the other two so emost serve in stead of hands; as you see him commonly go upon four feet, in the other two holding up something or other that he hath gotten to feed on to his mouth as men do, and as we do. His belly is slender answerable to his breast, having broad girdles and scales. He doth not sting with a sting as the Bee and the Wasp do, but with his mouth and snout like the Elephant, and he eats and takes up things with it, and sticking in a concave vessel he holds it in the top of his snout: out of this comes forth a tooth, with which he pricks or bites: he drinks nothing but milk and bloud; the which he draws forth of those he stings with very little or no pain at all, but only with a kinde of titillation or tickling. The light, like Truth, he doth exceedingly rejoyce in, and doth behave himself honestly therein and civilly. Yea the Fly doth so covet the light, that many times with the Spider or Spinner he loseth his life for his pains; at night he goes to rest (as honest folk use to do) and makes no noyse. He does nothing in the dark, counting it unbeseeming for him to do any thing privately, or to be guilty of that fact which if done in the light would be a disgrace and disparagement to him. I can assure you it is no little understanding that he hath also; whereby he doth escape the wiles of his treacherous enemy, the Spider: for he marketh him as he lies in wait for him and looks upon him, and so declines his force lest he should be taken in his net, and be destroyed. I must not speak of his prowesse and valour, for in that he may seem to surpass man himself. *Homer* the Prince of Poets, when he did endeavour to set forth and commend the gallantry of the bravest noble man, doth not compare his strength to that of the Lion, Leopard, wilde Boar or the like, but to the undaunted courage and confidence of the Fly. Who although he be never so often repulst and beaten off, comes on again, and bites as close as he did before: yea such a strength he hath with him, that he will not wound the skin of a man only, but of an Oxe or Horse: yea the Elephant also when he gets between the wrinkles of his skins, he will shrewdly vex him, and according to the bignesse of his snout gash and wound him: when he bites, 'tis not out of rusticity or clownishness to get bloud only; but by way of love & humanity, & for that reason especially he seisseth upon the fairest: yea what a pretty thing it is to see a company of Flies flying to and again playing and sporting one with another, and hanging upon a thred as it were dancers on the ropes? Moreover as the cleanly horse doth, she laies her ordure all in one place, so that upper wainscot and seiling of the rooms where they use are all full of great spots which they make on that occasion, which is an argument that they are not altogether void of some kinde of memory also. *Tzetzes* saith moreover, that such is their love to those of their own kinde, that they bury their dead corpses. *Alian* doth as much discommend them as *Lucian* commends them: and he inveighs against their procacity and sauciness; which is such, that being driven away never so often, they notwithstanding return with fresh assaults. He blames them likewise for their impudence, in that they couple in publick, and know no end of their Venery almost; neither do they as the Cock, when he once hath trodden presently fals off, but is born upon the back

The commendation of the Fly.

back of the female a long while, and she carries him; they fly away together into the air, yet are they not sundred with flight. Learned *Pennius* caught two Flies in the Act, and shut them up in a box, and the next day found them together still in the same posture; which doth much confirm what *Arist. Elian* and *Niphus* say, to wit, that Flies do continue very long in the act of generation. *Plutarch* saith that the Mouse and the Fly are indocile and unteachable creatures, who although they use the company of men daily; are by no means tamed, neither do they shew the least courtesie, or the least shew of a grateful minde for what they receive of any man: both of them are by nature very suspicious, alwaies fearful of treachery, afraid to be caught. She is altogether idle and careless, feeding upon the labours of others, and where ever she comes she hath a full table. For her the Goats are milked, and the Bee bestowes her pains as much for her as for any other; the Cooks provide Messes for her, the Confectioners Sweet-meats, the Apothecary Syrups, and these she tastes before Kings, and walking all over the table she feasts her self with them in their company, as also with all other whatsoever. *Plautus* took her to be of no use in his *Curculio*, where he thus speaks: *In my conceit you are a kinde of Lions amongst men, as Flies, Gnats, Sowlice, Fleas, that do much hurt and do no good.*

Well therefore did Nature take care, that she should have no certain place to dwell in, as honest folks have, but should wander up and down, where she could get her a lodging and travelling harbour. But in impudence she goes beyond any begger whatsoever; because they having had once a denial are therewith satisfied, but this begger will take no answer, but will fill his unprofitable gut with the best cheer in the house whether the master will or no. *Aristophan* in his *Pythagorista* recited by *Athenaus*, brings in an impudent Parasite speaking on this manner:

Cœnis etiam non vocatus, ut musca, advolo.

I hasten to supper as the Fly, without any invitation.

Some such like matter *Socrates* upbraids *Theodate* withall in *Xenophon*: wherefore the *Egyptians* being to set forth dishonesty and impudence together, they made the picture of a Fly, as *Orus* saith. Whence it is, that *Cicero* (if I be not deceived) saith it was said sometimes by way of jest concerning a troublesome impudent youth, *Abige Muscas puer*: Boy beat the Flies away. To this so pestilent a little beast Nature (as meet it should be) hath denied long life therefore. For as soon as winter begins to come on, the greatest part of them expire; and those that escape starving, in cliffs, wals, hollow places, ovens and such like, they lie all the while weak and languishing, and not able to hold out another winter. All of them are begotten of filth and nastinesse, to which they most willingly cleave, and resort especially to such places which are so unclean and filthy; unquiet are they, importunate, hateful, troublesome, tumultuous, bold, sawcy. *Homer* amongst the battels of the gods and heroes elegantly descants upon the basenesse of the Fly, who like the Mouse, alwaies hath his hand upon another mans trencher.

*The Fly, though often forced from your skins
Yet she returns again, shee'l never lin.*

Yea *Solomon* himself thought their nature to be so bad, that he saith in his Proverbs, that one of them is able to spoil a whole box of ointment. To conclude, the *Hebrewes* to set out the Prince of Devils, called him *Bahalzebub*, i. e. a Fly: which useth the same diligence, and never leaves off doing of hurt. Which is the reason that Witches and Wizards will have their Familiar to be alwaies in likenesse of a Fly, using the body of a bad creature to far worse purposes. I could alledge much more a great deal than this against the Fly, if I desired the name of *Antilucian*, with whom it is a disparagement for a Christian to contend, yea or to meddle withall, more than with the most loathsome carkasse. Neither will it be more disgrace to me to make nothing of a Fly, than for *Lucian* to make him an Elephant: both indeed being but losse of time, and vain ostentation of wit. But yet nevertheless that lest like the Eagle I may seem to contemn flies, or to neglect the least of Gods works; I shall with all diligence set down the Generation, Difference, and Use of Flies.

Flies are generated two waies, by coupling with their own species (which is done in the summer season, and in the winter if the weather be fair) or by the putrefaction of other things. The Flies use copulation, some of them dispatch the work sooner, others after some space of time: the manner whereof (as *Arist.* affirms) is divers from most of the other Insects; for when the male ascends the female, he takes the member of the female (that is stretched forth to seek for seed) into his body, the which being accordingly received, he furnisheth with matter and strength to bring forth. Reverend *Pennius* saw two Flies at *Hedelberg* flying in the act of copulation, who (as it had been the son of *Mercury* or *Venus*) seemed to be of a mixed nature, and they did get up by turns. Somewhat a while after copulation they exclude or shoot forth little worms, as the Hen doth eggs; which afterwards by a strange *Metamorphosis* are again changed into Flies. Although *Pliny* contrary to experience doth without ground affirm that nothing else doth arise out of them. Very rightly *Scaliger* saith, that the Flies at first do generate Insects unlike themselves, but yet in a capacity of becoming the same, (that is to say) white little worms, which afterwards being

being made like to Flies, have eyes hanging down by their sides; in reference to whose likeness there is a kinde of disease in the eye, called *μυοκέφαλα*, i. e. headed like a Fly. Now a great number of Flies, if not the more part of them, arise from dung, whence I have seen them to come perfect where before they were begun. But in this kinde of generation we must note, that Flies are not immediately procreated of dung, but of the little worms proceeding of digested dung, as the Philosopher writes in these words, *Ἀπὸ δὲ μύιας ἐκ τῆς σπυλίκου τῆς ἐν τῇ χασμῶντι καὶ μύιας, &c.* Which Gaza translateth thus: *Musca ex vermiculis fimi digesti in partes gignuntur, &c.* In English thus: *Flies are begotten of dung digested into parts, therefore they that desire to meddle in this business, strive to distinguish the dung that is not digested, from that is mingled with that which is digested.* Now these worms at the first are exceeding small, afterwards begin to be red, then as yet without motion as it were, cleaving by fibres they begin to move; then they become unmovable worms, afterwards they move again, then become they again to be without motion, and in conclusion by the assistance of air and sun there is begotten a living Fly. Arist. here, as it seems, spake rather from others observation than his own skill. For neither those worms that are generated by copulation; nor those which are bred of putrefaction are subject to so many metamorphoses or transmutations, before they are transformed into Flies. For they only grow to such a bignesse, afterwards are turned into a Nymph or young Fly, and so lie still, then at a certain time appointed by Nature the Nymph groweth to be a Fly.

Neither are Flies begotten of dung only, but of any other filthy matter putrefied by heat, in the summer time, and after the same way spoken of before, as *Grapalans* and *Lonicerus* have very well noted.

But yet the question would be, whether Flies are not immediately generated of putrefaction, and not of those worms. For experience witnesseth that there are a certain kinde of Flies which are begotten in the back of the Elni, Turpentine-tree, Wormwood, and so perchance in other herbs and plants, without any preceding vermiculation, or being turned into little worms first. So that Scaliger that angelical man, and the most learned of this Age, writeth thus of their original: *Peraadventure (saith he) they may seem not to arise from putrefaction, but from some certain principles changed as from some kind of liquid gum, or from some other matter concocted by Nature for this end.* Now whether concoction can be without putrefaction there is the scruple. Each part of mans body hath its conveyance for the expurgation of its excrements, called in Latine *Emunctoria*. But whether a living creature may be the excrement of a creature that never had life, let others determine; here my sight fails me, or rather I am altogether blind. A third way how Flies are begotten, Sir Tho. Knivett an English man, and of singular learning, did first of all inform Pennins of, and it was thus: The corrupted body of a Caterpillar or a little bruised, is converted into an imperfect *Aurelia*, then from that not a Butterfly, but three black eggs are cast out that are somewhat long fashioned, from whence proceed ordinary Flies, or others like to them; and some times the *Aurelia* being putrefied, neither Butterfly nor eggs come forth of it, but white worms, (sometimes one, sometimes many) come forth, whence are generated very small Flies.

The which famous observations of natural History truth it self doth enjoyn us to acknowledge received from the foresaid Knight; for no man before him did ever observe the like. Peter Martyr in his 3 Decad. and 6 Book, reports that he saw drops of sweat falling from the fingers of labourers, turned into Flies, and so they write that in the marshy Countrey of *Paria*, by reason of the contagiousnesse and venomous quality of the air, the drops that fall from the hands of the labourers do bring forth Toads. But whether it be done immediately or mediately by some worm out of which the Fly should break forth, he doth not shew.

In the year 766. before the Nativity of Christ, *Rivallus* then being K. of Britains, there were shewres of bloud three daies together very great, very many, from whence came abundance of Flies, and so poysonous, that with their stings they killed a great number of people: so saith the English History.

Now the Fly for the most part is not at the first a Fly, but a worm, proceeding either from the dead corpses of men, or the carcases of other creatures, then it gets feet and wings, and so becomes of a creeping creature, a flying; and begets a little worm, which afterwards becomes a Fly. Take off the head of a Fly, yet the rest of his body will have life in it, yea it will run, leap, and seem as it were to breath. Yea when it is dead and drowned, with the warmth of the sun and a few ashes cast upon it, it will live again, being as it were anew made, and a fresh life put into it, inso much that *Lucians* disciples were perswaded and did verily beleieve that the soul of them was indeed immortal. Forasmuch as it goes and comes, it owns its own body and raiseth it up, so that it drinketh, eateth, wipes its head and eyes, makes clean its snout, rubs its shanks and legs, claps its wings and flies: verifying the opinion of *Plato* concerning the immortality of the soul, and the fable concerning *Hermotimus Clazomenius*, whose soul would often go out of his body, wander up and down a great way by it self, and afterwards would return into the body, replenish and raise it up again. Some will put drowned Flies into warm Ashes, or warm Bran, and in a quarter of an hour fostering them in their hands and breathing on them, they will bring them to life again.

CHAP. XI.

Of the divers kinds of Flies.

There is a great deal of difference amongst Flies, whether you respect the matter or form of them. Some of them come from themselves by way of copulation as hath been said, others from some ascititious or external matter: such are they that are bred in Dung, Apples, Oaks, Beans, &c. In regard of their form or shape, some have two wings, others four, with horns or without; some short, some long, some have round tails, others sharp or piked, hairy and without hairs: in a word, they vary in colour, shape, bigness according to the nature of the Countrey they live in, or the putrefied matter whereof they are made. I wish I had seen them all, and I know *Apelles* himself would hardly have been able to paint their fashions.

Now for brevities sake we will make two sorts of Flies. For either they are ἀνθρωποφάγοι, or ἐντομοφάγοι. Those that feed upon their own species, or those that feed upon other things. The first of these called in Latine, *Lupus*, in English, the *Wolf fly*, is described to be big, black, with long shanks; he feeds especially upon flies, if he cannot come by these he preys upon other Insects. Those that feed upon things of another species: either they are such as feed upon living creatures, or upon things inanimate or without life. Of the first kinde is the *Flesh-fly*, *Horse-fly*, *Oxe-fly*, the *Suck-egge-fly*, the Fly that eats Serpents, the *Dung-fly*, the Fly that preys upon the *Humble Bee*.

The *Flesh-fly*.

The *Flesh-fly*, in regard of his bignesse and bulk of his body, is the biggest of all other, he hath a reddish head, his body full of gray spots, his belly thick, blew, transparent, having two wings, hairy, very greedy of flesh. He flies for the most part alone, unlesse it be perhaps in the flesh-market or Shambles; where the Butchers turn fencers, continually killing and beating them away with their Fly-flaps, lest with their fly-blowes (which *Hippocrates* calls *ιὺλός* in Greek) their flesh should be tainted. There is a story (as *Celius Rhodiginus* relates it) that at *Toletum* in the open Butcher-row, one Fly amongst the rest used to come by the space of an year, as white as snow, which I dare say was of this sort in regard it was seen to be

The *Dog-fly*.

so long together in that place. *Κυρομύια*, *Musca canum*, in English a *Dog-fly*; in the German tongue *Hunds Fliege*, *Hunds Mucken*; in the Polonian, *Psia Mucha*; *Isidore*, and *Euthymius*, and *Philo*, suppose it to be a Wood-fly: very irksome to the ears of Dogs, the which notwithstanding they shake it off never so often, yet returns with as much violence as before; where if he tarry any while, with the galling of the flesh he raiseth a blister: of whom *Homer* in his *Iliad*. 15. Τίτ' εὖ κυρομύια διδὲς βεῖδι Εὐπειλάωνος, i. e. *Why like a Dog-fly dost thou contend with the gods?* *Athenaus* also in his 4 Book, reports that the like name of Dog-fly was given to a certain famous Curtizan for her unparallel'd impudence, mordacity and troublesome nature. Now the Dog-fly (to borrow the words of *Philo*) is an Insect that bites hard, is importunate and treacherous: *ἐντομον λίσσιν ἀνθρώπων, ἀνάνδης καὶ ὀπίσθηλον*. This seemeth to me in holy Writ, as in *Exod*. 8. *Psal*. 77. & 104. to be the common name of all hurtful Insects, as appeareth by the *Chaldee Paraphrase*. As for their more special signification, they can be compared to no kinde of Fly better than those black great broad flat ordinary Flies which do so boldly fly upon cattle, and not only suck from the outermost skin of them watry bloud as other Flies, but with great pain fetch out and suck bloud very deep. They want a snout, but in stead thereof they have two teeth as the Wasps have, which they fasten deeply into the skin, but more especially they infest and annoy the ears of Hounds in Germany, insomuch that (as *Camerarius* witnesseth) they even pluck off the skin. These an English Gent. said he saw in Italy in shape altogether like the Dog-fly, only without wings: whose wings also are represented so close to his body that the learned Dr. *Barbar* takes them for the same. *Niphus* doth ascribe unto it wonderful swiftnesse of flight and roundnesse of body. The nearest in likenesse to it is the Tick or Sheep-fly, making a kinde of a horrid noise as he flies, and is in his flight more slow and heavy then a Gad-fly. There are two kinds of them, differing only in bignesse, the greater which is the *Forrest-fly*, the other the lesse living in hedges and quicksets.

The *Horse-fly*.

The *Horse-fly* called in Greek *ἵπποβίβλος*, in the German Tongue *Ross Mucken*, is of the bignesse of the ordinary Fly, with a flat, hard, smooth body, and of so compact a substance, that you can scarce break it betwixt your fingers; they are somewhat blacker than the common sort of Flies are, they never fly right forward but sidelong, as it were hopping and skipping as they go, they fly neither long nor fast. In England especially they are very troublesome to Horses, stinging them continually about the ears, nostrils, stones, and

the tails, with the sweat whereof flowing down to the root of the hair they live and are sustained. The English call it a side-fly or a Horse-fly, as the Greeks *αλευ εσπολύτας*, of the like signification. Some of the Greeks call them *κυροεσπύς*, and they say that in hot Countreys the Dogs are very much vexed with them. They say that it is of that kinde *Croto* makes mention, having wings and able to fly; but yet I think this to be another species; and only proper to Horses, and offensive to them.

This Beast-fly is in Latine called *Asilum*; in Greek *οἰστρος*, from *στρίβω* or *king or stinging*: whence not only this Insect but another that useth to scare Bees (of which hereafter) and a third very formidable to some kinde of Fish, are called by the same name of *Oestrum*. Of this kinde of Fly the Poet *Virgil* in the 3 of his *Georgicks* chanteth after his manner:

*A Fly there's in Silarus woods, that much
Useth neer to green holms, the Greeks call such
Oistrum, Asilus is the Latine names
It makes a sharp harsh noise, and with the same
Heards of cattel frighted fly and quiver,
Woods, and barks sound of Tanagrus River.*

Calepine and other Lexicographers of his gang, besides some Physicians, and even *Pliny* himself makes this Fly one and the same with the Oxe-fly, so that it is very probable that they did not so heedfully read *Aristotle* as they might, or did not indeed understand his meaning. It is confessed on all hands, that *Asilus* and *Tabanus* are a species of Flies, and that both of them have a sting in their mouth, with which they pierce the sides of the beasts, and suck out their blood. For so saith the Philosopher, *οἱ μύωπες καὶ οἱ οἰστροὶ τὰ δέρματα διατρύπτουσι καὶ τὴν αἷμα πρὸς τὴν τέλει πρὸς τὴν τέλει*: Oxe-flies and Brees make holes in the skins of four footed Beasts, and they have a strong tongue which serve them for a sting, they are creatures that eat blood, &c. But yet that they differ much, *Aristotle* and *Ælian* plainly shew. First the *Tabani* are more frequent especially in woods and highwaies that are beset with trees and hedges, as they who use to travel on horseback know to their great trouble and vexation. For in the heat of the day they sting deeply: And being then greater in number do draw out such a quantity of blood, that many times the horses strength fails them, in so much that the Countrey people are forced to beat them off from their horses with fly-flaps and boughs which they carry in their hands. But the *Asili* are more rare, and never fly but near the waterside. Moreover the *Asili* (as witnesseth *Aristotle*.) do take their beginning of certain kinde of broad and flat little creatures which haunt about riversides: but the *Tabani* come of certain worms breeding in wood or timber; that which *Sostrates* wrote, and *Pierius* diligently hath observed. Besides the *Asili* do trouble Oxen and all living creatures, according to that of *Hesychius*, *μύωπες μύωπες πρὸς ἐρεθίζουσι τὰς βεῖς καὶ τὰν ζῶον ἐλαύνουσι, οἰστρος δὲ μόνον βεῖς*, but the *Tabani* trouble Oxen only. To which agreeth that of *Orpheus*, vers. 47.

*Νῦν δ' ἐπεὶ ἀερόφοιτος ἀπὸ πρὸς δὴ οἰστρος,
Ημῖν τερον δέμας ἐμπροσθεν εἰς ἔχοντο εὐρύον, &c.*

*The horrid Brees mans body doth not spare,
He flies from us into the open air.*

And *Homer* in his *Odysses*.

*Οἷδ' ἐποβόντο καὶ ἰάχεον, βέες ὡς ἀγλαῖαι
Τὰς μὲν γὰρ αἰολὸς ἐρομένης ἐδύνησε
Ὡς ἐν εἰαρινῇ, ὅτε τ' ἡνίαλα μακρὰ πύλον.*

*But they fled home as herds of Oxen doe,
When that the Brees doth force them for to goe,
In the spring time when daies do longer grow.*

Where the *Scholiast* thus defines this kinde of Fly, *Οἰστρος ἐστὶ ζῶον ὑπερβαλὼν τὴν μορφὴν, &c.* The Fly called *Oestrum* is of a yellowish colour, who when it enters the ears of the Oxe, causeth him to run mad: upon which *Callimachus* in imitation of the Countrey people calls him *βοώδον*, an Oxe-driver. But the *Myopes* or *Tabani* do set upon Men, Horses, yea and Serpents (as *Nicander* affirms). Their shape and form is also different, as the Philosopher sheweth *De part. Anim. l. 2.* in these words: The tongues of the *Asili* and *Tabani* are alike, of a purple colour; yet these dare seize upon men, the other upon Oxen only. Now the *Asilus* hath a green head, and the rest of his body all over yellowish, having a greater snout than the *Tabanus*, but making not so great a noise, or buzzing; he carries before him a very hard, stiffe, and well compacted sting, with which he strikes through the Oxe his hide; he is in fashion like a great Fly, and forces the beasts for fear of him only to stand up to the belly in water, or else to betake themselves to wood sides, cool shades, and places that the wind blowes through. For whilst they stand in the cold water they flap their wet tails all about their bodies, and so cause him to be gone.

gone. The *Scholiast* of *Nicander* saith that they are bred of Horseleeches. As if he would have us to understand Horseleeches by those flat creatures (of which *Arist.* makes mention before) and yet it is against nature or experience that blood-sucking mothers, should bring forth a blood-sucking brood. He flies exceeding swiftly; drawes blood with much pain.

Pennius hath set down 2 very rare kindes of *Afilis*, one of which was sent him out of *Virginia* by *White*, the other out of *Russia* by *Elmer* a Chirurgion for a great present. That out of *Virginia* was full as big as the biggest Flies, having a reddish head, and very like in shape too, but only that the head was black, and had from the shoulders a white streak drawn to the mouth, having also bigger and blacker eyes. He had in his mouth a long sting and very strong, his shoulder of a blackish brown colour, from whence came forth two wings of a silver colour, to the tail downward, it had six or seven joynts or fissures, of a whitish colour, all the rest of the body blackish. In swiftnesse of flight inferiour to none, surpassing the most; his belly was between an ash and yellow colour, or a pale green. That of *Elmer* which came from *Moscovia*, had silver wings longer than the whole body, great eyes, very long, taking up almost all the head, a black bill or beak, hardish, tripartite, with which out of hand she penetrates hose lined with a three double cloth, skin, flesh and all, sucking it with great pain. As for the Generation of the *Afilis*, or the Fly with great eyes: I wonder at the inconstancy of the *Philosophers* opinion thereupon. For first he makes them to come of a little flat creature swimming in the water (which the *Scholiast* of *Nicander* not unfitly calls *βελιδνα*, i. e. *Hirudines*, in English *Horseleeches*) and in the 8. of his History, he will have them the off-spring of the Gnats, in these words: *ἐν τῇ δὲ τῇ ζῴων ἀποστάσει τῇ ἐν τοῖς ὕδασι, ἐκ τῆς μελαβαίνουσης τοῦ ἀδανυ μωφῆν ἔξω εἶναι ἐκ τῆς ἐν τοῖς ποταμοῖς ἐμυδίου, ἢ ἐξ ἐν τῇ δὲ οἰστῶ*: Some living creatures live first in moysture, and after that they change their shape and live out of it, as it falls out with Gnats about rivers, from which proceeds the Brees. But how that can be I know not: For of creatures that have wings, it is impossible that other winged creatures of a diverse form should be generated, as the diligent observer of Nature may easily gather. And so much of the Oxe-fly which the *Goths* call *Hestabryvis*: but the *English* have no name for it. [Wherein the Author seems to me to be mistaken, because it hath afforded it a very proper name as is abovesaid].

The Bee Fly.

The other *Tabanus* or *Afilus* is begotten in the utmost part of the combs, and exceeds in bignesse any Bee whatsoever; which, because he is so troublesome, not suffering the Bees to be at quiet (as the former would not suffer the catell) the Greeks have comprehended under the same name of *Oestrus*. The head of this Fly is of a bright bay colour, with a white streak running from his forehead to the nape of his neck, his shoulders and back of a dusky colour, in all parts else no way differing from the common sort of Flies.

He feeds not only on the juice of flowers and honey, but on the blood of beasts, which with great tediousnesse and pain he sucks out.

The second kinde of Tabanus.

Gnat like.

There is another Fly much of the same sort, with a head and body more inclining to green. His shoulders shine with greenesse, wings he hath two, whitish in the middle and outward parts, but are otherwise blackish or dunish. This only once *Pennius* saw it in *Hanworth* in the year 86. in the moneth of *August*. In the year 82. he found in *England* two other sorts of Flies like Gnats; one of which had a pretty big body, of yellow and red colour; it had two wings, the head very long, the tail reddish. The other also had a long head, long and slender shanks of a very sad black colour: the latter were longer than the former which he stretched at length when he flew and let hang down.

A Countrey-man there was that affirmed for certain, that out of their eggs (for he had observed them coupling together) came those worms that usually eat the leaves of trees.

Tabanus.

The Fly called in Latine *Tabanus*, is of the Greeks called *μύωψ*, by reason perchance of its stinging or pricking, for *μύωψ* signifies also a spur wherewith horses are pricked or spurred. The French call it *Tabon*; the Italians, *Tabano*; the Spaniard, *Tavano*; the Germans, *Braem*, *Ku-flyege*, *ross muck*; the Brabanters, *Rochleghebrem*; the Polonian, *Kirowia muka*; the English, a *Burrel-fly*, *Stowt*, and *Breeze*: and also of sticking and clinging, *Cleg* and *Clinger*. This *Calepine* more boldly then truly saith hath four wings. But with more judgement *Ælian* and others, say it hath but two silver white. The whole bulk or body is very long, divided into three principal parts, the head, shoulders, and the ventricle or belly, distinguished with five or six clefts or incisures, the whole body of a blackish white, in the mouth of it it carries a strong, long, and brown *Proboscis*; it hath six black feet, in all parts else representing much the Dog-fly. In the moneths of *July* and *August*, by reason of the extremity of heat they are most fierce, and do miserably handle Oxen and Horses and young catell, unless protected with fly-flaps, boughs of trees, or plants: which they follow by sent of their sweat, because they cannot reach them with their sight, being very weak sighted, from whence the infirmity of the eyes called purblindnesse is in Greek termed *μωμια*. They are generated saith *Pliny* of the worms that come out of the wood putrefied. Which some cunning men before they have wings did use to binde about the wrist of the left arm as a remedy against Quartain Agues. They suck out blood with such force and in so great abundance, that a friend of mine whom I dare believe told me, that his horse being

tyed to a tree, was by reason of the multitude of them, killed in lesse then six hours, they had drawn out so much blood that the spirits failing he fell down dead. By these things it is manifest, that the *Tabani* are of a different nature from the *Afili*, notwithstanding that most of the Greek and Latine Authors do seem to confound them and make them all one. Yea even *Gesner* himself in this very matter could not tell what to say in his book *de Quadrup.* and indeed unlesse it were only *Pierius* and my friend *Pennius* now deceased, no man as yet found the difference between them. *Ardoinus* is here desired to be censured in the first place, because he saith that both the *Tabanus* and *Afilus* have stings in their tails as the Wasps have: and secondly, because he makes them to have eight feet, whereas none of them in the world was ever known to have above six. Lastly, he reckons them in the classis or rank of Gnats, whereas the Gnat never bites in the heat of the day (as the *Afilus* and *Tabanus* do) but altogether in the night at what time they are very irksome indeed.

Next to these is another Fly shrewdly annoying cattel in the heat of the day, which *Pennius* calls *Curvicaudam*, very well in English a *Wringle-tail*, in regard that alwaies sitting upon the buttocks or belly of the beast, he bends his tail towards him with his sting started, that he may be ready to strike at pleasure, whensoever opportunity may offer it self. This Fly the English in their proper tongue call a *Whame* and a *Burrell-fly*, and it is scarce found any where else but in England. This kinde of Fly is almost like the Bee in shape and colour, only it is bigger in body. It doth not cleave to the flesh, nor suck blood as others do, but only stings with its tail, flying a long way after horses, and stinging them in their travel. Horses are naturally afraid of this Fly, whom upon the least touch they endeavour by what means possible with their tails, feet and mouths to drive away. Some are of a minde that these flies do not indeed use a sting, or prick, but with their tails they fasten their dung to the horses hair, from whence a while after come a number of very irksome Nits. But experience must prove that, for reason in a matter so improbable is silent. True it is they are very violent upon their prey, as being blinde both the *Tabanus* and the *Wringle-tail*, which may be the reason why they are so bold and fearless, as being secure of any danger. But especially the *Oestrus*, from whence those famous Poets of old were said to be *Oestro perciti*, stung with this furious Fly called *Oestrus*. *Plutarch* calls them *disganaequeirus*, *Gad-stricken*.

Those kinde of Flies that follow are more rare.

The first of which is very like the lesser Butterfly, with four silver wings full of blackish spots, all the body over adorned with silver streaks running athwart of it, the tail reddish or brownish, the head black, the shoulders of the same colour with the tail, the fore-yards are thin, black and short, the feet small and black; they are most commonly seen in hedges, especially in the morning. The second very little differing from the former, but that the body, sail-yards, legs and feet are of a brownish or dusky colour. The third species hath four wings: this hath longer wings than the two former, spotted with black spots, the head somewhat bigger, black, here and there marked with yellow spots; the two sail-yards thin and black, six whitish feet fastened to the more bulky breast, the shoulders are embroidered with yellowish white spots, overthwart the back are five streaks of a yellow colour; with a little spot or speck between each almost of the same colour; in the tail there are five red spondils, the end of which is forked. The fourth is not much unlike, but it hath silver wings, without spots, the sail-yards black and somewhat longer, the body is adorned with seven white lines athwart. I have seen also two Flies with tails like Scorpions. The first of them, as the former spoken of, hath silver wings, but somewhat lesse, with three crosse black lines towards the end, the head black, the breast, the feet and shoulders whitish: the rest of the body black, the tail hath five joynts as it were or partitions, three of which are of a pale red, the rest black, the end of the tail forked, the forks are black, and like the Scorpion turned up. The other almost like to it, but the very end of the tail is more thick, the fork that is in it more blunt, the head dunnish, the mouth somewhat long, each wing bedeckt with six black spots. There is also another sort of Fly that hath four wings, the body greenish, the four wings longer than the body, made as it were of melted silver, the nerves whereof are greenish, the sail-yards thin and black, eyes as yellow as gold, from whence it hath the name, and that not undeservedly of *Chrysopsis* a golden eye, slow in flight, of a very

LIII

strong

strong sent, which like the Moth it loseth with the life. A great frequenter of gardens and sitting on Elder : whether he come of a Caterpillar, as the Butterfly doth, or out of the worms of trees, I cannot tell. That most learned and courteous Gentleman *Joach. Camerarius* first shewed it to *Pennius*.

There are sundry sorts of Flies, of the Greeks called *πικρυαί*, in Latine, *Pilicanda*, *Seticanda*; in English *Hair-tails*, or *Bristle-tails*. For some of them have one, others two, other some yet three or four bristles in their tail : of which in order.

The first of these called *Henothrix* or *Unisera*, is a fly that hath a tail, the whole body is black except the middle or the back and belly that are red ; it hath two silver wings, the shoulders thick, with two little black sail-yards, and a long bristle shot forth of the tail of it. The figure of

this Fly did the abovesaid *Joachim* send to *Pennius*, withall attesting that it never offered to light upon any other herb but the chiefest *Ameos*. *Διστόρυγες*, are two Flies that have two hairs in the tails of them ; whereof some have bodies sharp or piked at the end, others more blunt. Of the former sort, two I have seen with four silver wings without spots, head and shoulders blackish, the rest of the body dunnish, bedecked with divers crosse lines of black. Both these had long and slender sail-yards, and the like in the tail, only somewhat longer, the body big and bulky. Those of two hairs or bristles are of five sorts : the

first, in all things like those with a hair, but that these are almost all over yellowish, it hath two very long bristles in the tail, one of which being stretcht out at length is like the tail of a Greyhound running after a Hare ; the other rivelled inward is like a spiral line. The second sort, is a kinde of long Fly, having four silver wings, yellowish feet, the body black, shoulders thick, two sail-yards long and slender, the belly toward the tail, bigger then the rest, out of which two short bristles do issue, turning upwards ; it lives in hedges. The third of these *Carolus Clusius* sent from *Vienna*, with a dusky dark coloured body, the wings large in a mixture of blew and silver colour, the tail acuminate or piked, out of which grow two bristles or plumes rather (as *Pennius* observes) of a Partridge colour speckled, with black and dunnish spots intermingled. The fourth kinde is of a round orbicular body, about an inch in length ; the head, shoulders and breast very black, the horns short, it hath six black feet fastned to the thick breast, the foremost shorter than the rest, the hindermost the longest : when she flies she puts her feet together and lets them hang down, it hath four darkish wings of a silver colour, her eyes black and shining, the utmost tip of her tail black, out of which peep two very short bristles from the shoulders downwards to the middle of the tail ; she is almost of a yellowish colour ; the tail is joyned to the shoulder as it were with a long thread : it runs very nimbly and as it were leaping ; her nest is under ground, she feeds upon small Flies and Caterpillars. The fifth and last sort of these, is by much the least, yet of the same form and figure, only it hath very bright silver wings ; the whole body to the tail is of a tawny or darkish red colour.

Of those that have three hairs or bristles there have but 5 sorts come to my notice. The first hath a body very long and black, the middle very red from black, with two black horns in the head, silver coloured wings, the very edge or extremity whereof is spotted with a blackish spot, the thighs or shanks reddish, in the tail it hath three long hairs or bristles, and flies very swiftly. The next is like to this, but lesse, all over black, longer than the former, thinner and slenderer, it hath silver wings also, the cornicles or horns all one with the former, it also thrusteth forth three long bristles at the tail, not so swift in flight by much as the former. There is another of this kinde all over whitish, but only the wings, which are spotted with four black spots ; the utmost of which are larger, the others shorter, which

or stretching them forth in manner of little horns. Such a one as this *Pennis* took notice of in the year 73.

so long as she flies not, stand bolt upright: she hath six feet, the four lesser of them fastened to her body, the two foremost are greater and black, coming as it were out of the neck, between the two black round eyes which standerth forth of the head come forth two black short horns; the body thin, round, long, about a fingers breadth; in the tail are to be seen three bristles as long as the body, the which when she flies she puts into the form of an exact triangle. In the moneths of *May* and *June* before and after rain she is to be seen; she flies ordinarily about rivers with some company with her, with whom she seems to sport her self by the way; she useth her forefeet sometimes to feel whether any thing lie in her way, extending

hath a very long body, two wings somewhat shorter then the body, the feet of a reddish yellow, the tail altogether as long as the body, seen only once of *Pennis* about *Greenhure* in *Kent*.

The Fly with four hairs represents the first of those with three hairs, only its tail is somewhat bigger at the latter end of it, the feet as also the horns black, the wings long, the outermost three times exceeding the innermost in bignesse, having a black spot in the middle, and in the tail four hairs or bristles.

To these are to be reckoned those Flies called in Latine, *Mulles*, *Pavones* and *Libella*, which the Greeks from the likeness of a fish of that name called *Ξαγαινα*. In English they are called *Adders*, *Boules*, *Dragon-flies*, and *Water-butterflies*; because they are seldome seen on land, but alwaies about waters, as rivers, or fens. The Italians call them *Cervetoni*; the Hollanders, *Romdoubt*: for the form or shape of their bodies they differ little or not at all, but only in colour; some of them have bodies two inches long, long and slender withal, in form of a pipe or cornet: and these consist of three parts; the head, breast, and the rest of the body which is in stead of a tail. The head with two great goggle eyes, of the same colour with the rest of the body, is made fast to a very short neck, to which the forefeet are joyned, all the rest being annexed to the breast. The hinder feet likewise are the longest, the better to lift up and stay their bodies. All of them have

have forked tails, and with these they couple, remaining long in the act of generation. Countrymen for the most part of them, are of opinion that these Flies are engendered out of the worms that grow from the water-bulrush putrefied; which if I should yield to be true, yet doth it not take away copulation, and putting forth of worms from their own bodies, whereby they might from time to time increase, and perpetuate their propagation. The lesser of them are very slow of flight, the greater very swift, and are only to be seen in heat of Summer. Of these we have observed three sorts or species: The greater, lesser, and least of all. The biggest of all, some of the English call *Brises*. Of which sort eight only have come to our view. The first greenish, the spots also in the neck and tops of the sides of a dark green, the wings silver coloured, they are swift and make great speed in their motion. He hath seven black lines athwart the back, and feeds upon flies like the Swallow. The second is like to this, but of a more dark hew. The third hath eyes like to pearls, silver wings, the hem or extremity whereof is stained with a dusky spot, the body is black, but very seldome yellowish on the back and belly; the tail black and forked, adorned as it were with two plumes. The fourth is of a muddy colour, having the sides divided as it were into six parts; near about the coming forth of the wing which are like silver, you may perceive a large black spot, distinguished in the middle with lines of mud colour, toward the end of the tail there appear four or five hairs or bristles. The fifth hath its head and tail gray, in manner of a Trident. The sixth is silver winged, with a black spot in the middle, the body all over black; the back and belly sometimes, but that seldome of muddish colour, the breast and

The greatest Libella.

The Medium.

The Smallest.

shoulders half black, hark yellow, under the end of the tail two hooked bristles, at the end of all five but very small. The seventh hath a head, neck, and shoulders of a dusky colour, the rest of the body red, procreated in *Pennins* study of a little worm that we never had seen before. The eighth shorter then the rest, with eyes like pearls, the body allover of a yellow colour, except where it is thwarted with cross streaks or lines, the tail seems as if the end were cut off, the but end thereof more broad, the extremities of its silver wings are darkned with a black spot, they are to be found most commonly amongst the corn.

The middle sort of the *Libella* do set

set forth Nature's elegance beyond the expression of Art. The first is of a most curious colour. The body blue or sky colour, the wings of bright violet colour, the space between the shoulders is adorned with four golden gems, set as it were in a blackish collet. The second hath the head and body gray, the wings whitish, which are beautified with gray lines drawn quite through them, in the middle they are of a purple colour. The third hath its head and body of a greenish colour, the lines of the wings are marked as it were with blood colour streaks, towards the edges or outmost parts like to a dark purple. The fourth seems to be all over of the same colour, to wit, of a dusky colour mixt with a pale green. The eyes of the fifth are blue, the head green, the whole body mixt of green and blue, except the wings, which are most accurately wrought with silver colour and black, in the middle shadowed with a dark purple. The sixth is all over green; yea and the wings themselves are of light green.

I have seen four of the least sort of the *Libella*. The first the body all over of a bright blue colour. The second red, the wings alike to both of them a silver colour. The third yellowish, but the tail more thick; the edges of the wings (as also all the lines that run along them) are red and marked with a blood colour spot. The fourth which is the least of all, hath a long spiny tail, a great head, blue eyes standing out with two little horns to guard them; the body somewhat long, slender, underneath greenish, above blackish, on the back it hath two greenish lines or streaks drawn along from the head to the rising of the wings, the tail bound together with five joints or knots, in the end whereof is a ring of bluish colour.

One there is of this number which killeth some of the other bigger very speedily: of a thin gray coloured body, and the wings alike coloured, and when he creeps into an apple, no hole can be seen where he went in: he feeds also upon seeds. This Fly *William Brewer* a learned man and an excellent naturalist sent to *Pennins*. There are found in the leaves of young Fennel Flies of an exceeding smallness, inasmuch as sometimes they are so little, that they are not able to be seen; they run and fly very swiftly, inasmuch that you would wonder how it were possible for nature to fasten feet and wings to such very exceeding small bodies.

Water Flies, of the Greeks called *ixior*, or *Lacustres*, as abiding in fenny places, are those that feed upon things that swim upon the surface of the water, and that live especially upon the water, as these and the like, *Phryganides*, *Macedonica*, *Tigurina*, *Aeschna*, *Lutea*, *Fusca*, &c. *Phryganides* comes from the little worm *Phryganium* (which in English is called *Cados worm*) living in the waters, and in the midst of *August* ascending to the top or superficies of the waters; it hath four wings of a brown colour, the body somewhat long, having two short horns, the tail forked, or rather bristles coming out of the tail. The form or figure of this Fly is various, in regard of the great variety of those little *Cados worms* whereof they come.

Among the *Macedonians* about the River *Austrum* which runs in the midst between *Beroza* and *Thessalonica*, there fly a kinde of Flies, which are not every where to be found, neither are they any way like other Flies, they are neither like the Bees, Wasps or Hornets, yet resemble all in something, in bignesse the Hornet, in colour the Wasp, in humming the Bee; in audacity and boldness all the rest of the Flies; the country people call them *inæques*, the Latines *Equisetiles*; these flying upon the surface of the waters become a prey to the fish that are in the river. The greater summer Water-fly is seen in *Helvetia* in the month of *May* (commonly cald *Tes glaffi*) as we have heard reported by a Gentleman, but which we leave to those of that Countrey to describe. The *Aeschna* so called, are a kinde of Water-fly of an ash colour, with four wings, six feet, near the tail having as it were many downy hairs. The Water-fly called *Lutea* is of a yellowish dun colour, it hath long wings, always standing bolt upright upon the shoulders so long as it flies, the eyes big and standing out of the head, the tail long and knotty, having two long hairs or bristles at the end of it; she is conversant alwaies about rivers, seldom elsewhere, especially after rain. There is another of a dun colour with four long wings, and long shanks, the body full of joints, two long horns it carries in the forehead, the head little, the eyes blackish and standing out of the head, the wings dun, but a little more bright then the rest of the body. For the most part found in woods adjoining to fens and standing waters. To conclude, I shall relate amongst the rarer sort of Flies, that of *Cardane*, as he himself describes it. Thus: I have said he a little creature like to a Beetle, of no unsavoury smell, soft, and the swiftest of all that ere I knew of Insects, it is of a dark yellow, not black, with six feet, and two very short thin wings not covering the tail; the tail is of the same figure and form with the head, inasmuch that you would think it had two heads; for as it hath a mouth in the upper part of the head, and two small cornicles there under the chin, so it hath two others also in the lower part longer then the creature it self, as many likewise in the tail, but these shorter then the two longest in the head; only the uppermost of those are longer and thicker then the lowermost. Which rare creature I wish I had seen with *Cardanus*, that I might have here added to this description the figure of it. There is also besides these a Water-fly, which men call from the length of the feet or shanks of it, *Tipatums*, *Macropedium*, *Pedonem*, *Gruinam*; called therefore in English a *Crane Fly*. Of these Flies are found four sorts. The first species hath long shanks like a wood Spider, the body almost ovall of a whitish ash colour, silver wings, black eyes sticking out, with two very short horns, the tail pointed or piked. It flies (much like the Ostrich) hopping with the feet, sometimes it flies in the air but not far nor long. So greedy after the light, that it often

oftentimes is burnt in the candle. In Autumn it is frequently seen in pastures and meadows. This of the male kinde. The female is almost alike, but somewhat more black, the end of the tail as it were bitten off; these are called in English *Shepherds*, in Latine *Opiliones*, because they are most often seen where sheep use to feed. The second sort of *Tipula* hath a great head, eyes standing out, four small horns, the body pleasantly various with the colours yellow and black interchangeably mixt. The third is almost like unto this, saving that the body being all yellow, is better set out with six or seven black spots; both the male and female have a three forked tail. The fourth species is very rare and curious, the head and especially the mouth forked, the shoulders swelling, the feet shorter, the body twice as thick as the rest; the back black, the belly and sides yellow, the tail black and picked. It lives in hedges in the Summer, and is seldome found in open fields. Those *Tipula* or *Crane-flies* afore-said do couple with their tails turned to gether, and so they fly; yet sometimes they turn again as it were to embrace one another.

CHAP. XII.

Of the use of Flies.

These little creatures so hateful to all men, are not yet to be contemned as being created of Almighty God for diverse and sundry uses. First of all, by these we are forewarned of the near approaches of foul weather and storms; secondly, they yeeld medicines for us when we are sick, and are food for divers other creatures, as well Birds as Fishes. They shew and set forth the Omnipotency of God, and execute his justice; they improve the diligence, and providential wisdom of men. All which shall appear in their places.

Prefaging of
weather.

As for their prefaging of weather: when the Flies bite harder then ordinary, making at the face and eyes of men, they foretell rain or wet weather: from whence *Politian* hath it.

*Sitiensq; cruoris
Musca redit, summosq; proboscide mordicat artus.*

English:

Thirsty for blood the Fly returns,
And with his sting the skin he burns.

Perhaps before rain they are most hungry, and therefore to assuage their hunger, do more diligently seek after their food. This also is to be observed, that a little before a showre or a storm comes, the Flies descend from the upper region of the air, to the lowest, and do fly as it were on the very surface of the earth. Moreover if you see them very busie about sweet meats, or unguents, you may know that it will presently be a showre. But if they be in all places many and numerous, and shall so continue long (if *Alexander Benedict.* and *Johannes Damascenus* say true) they foretel a plague or pestilence; because so many of them could not be bred of a little putrefaction of the air.

Many

Many waies doth nature also by Flies play with the fancies of men in dreams, if we may credit *Apomasaris* in his *Apotelesms*. For the *Indians*, *Persians*, and *Egyptians* do teach, that if Flies appear to us in our sleep, it doth signifie an Herald at Arms, or an approaching disease. If a General of an Army or a chief Commander dream that at such or such a place he should see a great company of Flies; in that very place, where ever it shall be, there he shall be in anguish and grief for his Souldiers that are slain, his Army routed, and the victory lost. If a mean or ordinary man dream the like, he shall fall into a violent Feaver, likely may cost him his life. If a man dream in his sleep that Flies went into his mouth or nostrils, he is to expect with great sorrow and grief imminent destruction from his enemies.

Nor do they only foretell storms, that shall fall out such daies, or such times of the year; but they do afford much matter for Medicine, and cure for diseases. For *Galen* out of *Sarannus*, *Asclepiades*, *Cleopatra*, and others; hath taken many Medicines against the disease called *Alopecia* or the Foxes evill; and he useth them either by themselves or mingled with other things. For so it is written in *Cleopatra's Book de Ornamentis*. Take five grains of the heads of Flies, bear and rub them on the head affected with this disease, and it will certainly cure it. *Asclepiades* used to take a great many Flies heads fresh pluckt from the body, and rub the part that was bare or bald with this disease, especially if they were exulcerated. For the blood of Flies (saith he) doth much help the parts that are exulcerated with Nitrous medicines; or are otherwise galled or fretted. *Sorannus* used to mix a pot full of whole Flies dried to powder, with *Alcyonium*, quick Brimstone, Gunpowder, sowes Gall, and other like things against the Fox-evill. Some adde to these Bears hair, roots of Reed, and Fern, and bark of Chestnut; and with which medicine they cure perfectly not only the Fox-evill, but whatever defluxion of hair, and the thinnesse thereof however contracted; the place affected being only first rubbed till it be red again, with fig-leaves. Others use the blood that runs out of the heads of Flies: other some apply the ashes of them ten daies together with the ashes of paper or nuts, so that the third part be the ashes of Flies. Some others do temper ashes of Flies with womens milk, or coleworts; some only with honey. *Pliny*. After the same manner, *Haly* and *Marcellus* burn the heads of Flies and mingle them with honey in stead of an oymment. *Brassavolus lib. de morbo Gallico* maketh use of both the blond and the ashes of Flies against the Foxes Evill. The like Medicine *Pliny* useth to procure hair on the eye-lids. Take of ashes of Flies and Mouse-dung of each alike mingled half a penny weight, add to it two sixth parts of *Stribium*, and with these and *Oesopus* or sheeps fat anoint the part. Some prescribe Flies with the roots of Docks for the Leprosie to be annointed withall. *Pliny* saith that there were some, that for the same cause did give 2 red Flies dead, in drink, but those that were very weak a fewer number. That Flies are very good for sundry diseases of the eyes, not only *Haly*, *Galen*, *Pliny*, and *Archigenes* have affirmed, but also *Neotericks* or later writers, especially for the Pin and web, Bleer-eye, squint-eye, and warts on the eye-lids. If the eyes be washed in the evening with water of ordinary Flies distilled in way of bath, for a moneths space, it will cure them of all spots or films. If the hair be often wet with it, it will grow exceedingly. But the Vessel must be buried in Autumn, and the Material distilled about Winter. With two drops of this water put into the ears, *Gesner* writes, the deafnesse of them will be cured; and this Medicine he saith he learned of a Jew. *Mutianus* which was thrice Consul, from observation, did hang a live Fly in a little linnen bag about his neck, wherewith the rhume or bloudshot of them was cured, as *Pliny* affirmeth.

Flies in an odde number being rubbed together are reported to be very good to cure a fellon on the ring finger. Bean Flies drank with vinegar do drive forth a horseleech sticking in the throat. *Haly Abbas*. The Fly *Napellaris* of the herb *Napellus* or Wolfebane so called, doth not only cure the poyson of that herb, but all other poyson whatsoever, as *Avicen* witnesseth, and *Julius Scaliger* confesseth: from whence this Antidote is made. Take round Birth-wort, Michridate of each two ounces, terra sigillata half an ounce, Flies of *Napellus* in number 18, juice of Citrons what may suffice, mingle them, make an Opiate. For (saith *Scaliger*) against the biting of the *Tarantula*, or any other venomous beast, or the poyson of Wolfebane there is no Antidote comparable to this. The same do *Gainerius*, and *Petrus Apponensis* teach us. Yea, moreover when as there is no Fly almost but will cause vomiting (as I shall make good out of *Arnoldus*) why may not all of them be thought preservatives against poyson? *Cardanus* in like manner commendeth the wormed Fly. But it is best learning of medicines by hands and eyes: *cardian de talis xepot is oupan didonaxid. i. e.* by known experience, lest while we affect unknown medicines we lose the use of those we know. He tels us that an oyl made of wood Flies was in great estimation; yet he telleth not us how to make or to use it. A Fly chewed and swallowed doth vehemently provoke vomiting. *Arnoldus*. I have heard of a certain man (saith *Gesner*) that was wont to take three or four Flies into his body, which gave him a very good stool. Take five grains of Broom-flowers, let them be put into an earthen pot, with butter here and there laid between them bed upon bed, with which the vessel may be filled, and being very well closed, let it be buried in horse dung, where the Sun useth to come, for the space of one year; at the years end you shall finde the Flies turned into an Unguent; the which afterwards are exceeding good for any grief whatsoever in any part of the body, as I have learned of a friend of very good credit. *Nonus* adviseth to take the bodies of great Flies when the heads are off, and rub'd between the fingers, and to anoint a small impostumate swelling therewith, for a special remedy. *Fortius* the Poet affirms, that

that there was a *German* maid which lived three years with eating of Flies. If cattel cannot urine, or the urine scald their genitals, put but a live Fly into them, and it will give them ease. *Colymbella*.

Neither do they serve for the health of men and cattel; but withall do seem to be created for food and sustenance of sundry sorts of creatures. For there are some kindes of Spiders which hunt after Flies and prey upon them. Swallows feed on Flies, and almost on them alone, as if they were to be supposed to be made only for them, inasmuch as without them the Swallow could not live: and that the reason why in fair weather they hunt after them aloft in the air, in rainy below near to the earth. *Pliny* affirms that the Bird called *Himantopus*, makes them his chiefeft food. There is a kinde of Duck called of the *Tigurini*, *Muggent* (as if you would say, the Duck that catcher Flies) like to the tame Duck in bignesse, which greedily snatches up the Flies swimming on the water and eats them.

The *Chamaleon* which some have reported, but falsly, to feed only on the air, feeds on Flies, which with his tongue six inches long, putting it forth suddenly and waving it to and fro, he hits unawares, drawes to him and devours them, as I have seen with mine own eyes in the year 1571. All those Birds called *Wagtails* (if I am not deceived) live upon Flies, but especially those that are whitish about the tails: in the *German* Tongue *rodten 'uogel*, but others call it more properly *Muggensticher*; in Greek, *μυγοπαρ*; in Latine, *Muscivorum*; in English, the *Fly-eater*, as being fed with nothing else, as *Beilinius* writeth. The bigger sort of *Zigaine*, so called, feed on Flies which they catch as they fly, as Swallows do, and never misse one, as I have taken a great deal of sport to behold. The worms of *Flesh-flies*, which we English call *Maggots* and *Gentles*, Fishes are very much taken with; Anglers use to fasten these to their hooks to catch *Roch*, *Perche*, *Carp*, and other fish withall, very good they are for that purpose especially if preserved in honey. *Trouts* are taken with the *ground* or *Gaipath* Fly, but chiefly with the *dung* Fly; so that the Anglers use to fasten one or two of them to their hook, and with a sporting, or rather cunning snatching back of their Line, do invite the *Trouts* more greedily to bite, and the bait being swallowed down to hang the surer. Others put as many of those flies upon their hooks as they will hold, and plunge them quite down to the bottome, especially where they know the greater *Trouts* use to haunt, who are very desirous of the bait so laid before them, and by the their greedinesse become a prey, and lose their lives; as *William Bruer* informs me. The Fly called *Phryganium* (in English, the *Cados* Fly) serves for the like use, as also the Fly which usually sits upon mans ordure. But every moneth must have his several fly, for that which is for one moneth is not for another; the which the Fishers very well know, who in defect of the natural Fly do substitute artificial Flies made of wool, feathers, or divers kinde of filken colours, with which they couzen and deceive the Fish. Only you must take heed that as soon as ever they bite, you pull your line to you, lest the Fish refusing the unfavoury bait get away. In the River *Astrum* there swim fish of divers colours feeding upon the native Fly that flies on the top of the water, which when the fishermen perceived, they began to catch of those kinde of Flies, and fasten them on their hooks. Now these Flies it seemeth as soon as ever they are touched lose their native colour, and so become altogether unuseful to fish withal. Wherefore they are fain to use artificial ones made according to their shape and colour (as *Alian* reports). They add also to the purple wool, and divers coloured, made into the shape of that Fly, two cocks feathers of wax colour, and so exactly resemble the natural Fly. From whence we conclude this art of making Flies to be very ancient, and derived to us by long tract of time; however we have some bold bragging hookmen at this day that ascribe it to their own invention. Nor may we wonder that fishes and fishermen do so lie in wait to catch Flies; when as *Domitian* the Emperor thought it a work not unbeseeming *Caesar* himself; who as *Suetonius* saith of him, with an iron pointed instrument stab'd all the Flies in his Chamber to the wals, as they stuck upon them, and would not leave so much as one; inasmuch that when it was asked by any who was within with *Caesar*, the servants answered, *Ne musca quidem*, no not so much as a Fly.

But how strongly do those infirm creatures demonstrate the great power of God? For consider but the least Fly that is, and observe how in so little a body the most high God hath curiously fitted feet, wings, eyes, snout, and other parts, which yet are lesse then the least threed. How doth he out-fly a Fly of his own name ten times bigger then himself? doth he not excell all other Flies in running? doth he not pierce deeper with his snout, and draws out whole vessels of wine? The *Elephant*, that great monster of creatures, is often vexed and molested with Flies; and that they are able to tame the Lions, *Aesop* shewes in his elegant Fable. The Horse, and Bear are not able to endure their biting, much lesse then can the Sheep, and Asses, unlesse humane prudence came in for their aid, and did prevail against them. Hence came the invention of that which some make of Leather, rushes, or bristles which we call a *Fly-flap*: and that orbicular fan fastened to a Longstick made of the most choice Peacocks feathers, of which *Propertius* of old, makes mention in this Distich:

*Lambere que turpes prohibet tua prandia Muscas,
Alitis eximia cauda superba fuit.*

That

That is to say,

*That which forbids the nasty Fly thy dish to lick,
Is Peacocks feathers fasten'd to a stick.*

The Indians and Germans make these, the one of Oxes, the other of Foxes tails. Some make them of small willow twigs, others after another manner: the fashion whereof, *Alian, Vegetius, Ovid, Grapaldus* do exactly describe. Moreover, whereas the rugged skin of the Elephant is instead of tail, mane, hair, (to speak in *Plinies* language) neither hath he any bristles to cover him, or tail to guard him, therefore men cover him all over with linnen or silk, the better to free him from the irksomnesse of the Flies, and to keep him safe that they may not come at his skin.

That Oxen and cattel be not annoyed with Flies, anoint them with oyl fryed in a frying-pan, or with Lions grease, and Flies will not settle on them. The same will *Origanum* or wilde *Marjoram* effect, if rubbed till it be limber and spread upon them. If you anoint the hairs with the juice of the leaves of a gourd, you would not a little wonder how it will free them from Flies; this I have oftentimes made use of with profit. *Selardanus*, Bay-berries being made into a very small powder and boyled with oyl, have the same virtue, if they be anointed with them; as also the drivel of foam of Oxen and Horses. *Africanus*.

Oftentimes Flies get into the wounds and ulcers of cattel, so that by reason of the worms which they breed, there is added much malignity. First of all therefore, those ulcers being made clean, *Columella* applies an ointment made of Pitch, old Oyl, and Bacon grease, both within and without; afterwards he applies Whey wingled with Ashes. Almost all the Summer long the ears of dogs are so exulcerated with Flies, that they often lose them quite. The which that it might be helped, they should be anointed with oyl.

The Fly *Ophioborus* (from eating or devouring of Serpents) gets close, saith *Actius*, between the scales of the Serpent *Dryinam* especially, insomuch that at length it kills him outright; this Fly from the colour of its wings is called of *Hesychius* *χαλκημυία*, or the *Brazen fly*, because it resembles the colour of brasle, it feeds on black Beetles; and by biting hegets in the Serpent extremity of heat, after that unquenchable thirst, and death followes: having fed upon the carcases of these Serpents, if afterwards they happen to bite a man, the wound is incurable and deadly.

The Flies called *Mexdivora* or *Dung-flies* are of divers sorts; one is like the *Flesh-fly* but bigger, his eyes of a darkish red, shoulders black, in which there is a circle somewhat long and whitish; the back black drawn over with crosse lines or streaks. The wings silver colour, longer then the body; most commonly they are seen about mens excrements, seldome elsewhere. There is also a Fly green all over, so resplendent and glittering as if it were transparent, the head dunnish, silver wings, frequently in the woods, and most commonly about dung; in bignesse equal to the common or ordinary sort of Flies. Whether it be that which *Silvaticus* calls *Giacucul*, I know not. I have light upon another Fly called *καρσος*, *Dung-eater*, lesse then the green Fly, the body dun, the head of a full red, with a line along the middle of it. I have another the body rough, yellowish, the eyes black standing out; the shoulders and back black, curiously spotted, the tail ash-colour. Another fly there is whose shoulders are of a pale red, somewhat towards a Saffron colour; it hath two horns longer then the rest, silver wings covering all the body; the head black, foursquare, and small, very frequently seen about horse-dung. To conclude about dunghills (from whence also it is probable they are generated) there are certain yellowish Flies, the body somewhat longer than the rest, and bunching up; of whose generation we have before made mention. Also I saw another rare Fly, not every where to be met withal, that feeds on a mudwall made with mud and putrefied materials, it was black all over, only it had silver wings, and in the shoulders it hath four white spots, in the rest of the body eight, i. e. on each side four; the eyes white, the frontlet marked as it were with a white asterisk or little star; out of which shoot out two black horns and long, it hath also upon the top of the thigh or shank a little white spot sprinkled up and down. This Fly I keep, though dead, in a box for the rarity of it. *Bombilophagus*, is a Fly, montanous, big, very black, the body rough, the eyes somewhat long, great, the head of a bright red; for his prey he falls fiercely on the Humble-bee, and getting the better of him by flight, nimbly gets upon his back, and sticking close to him, doth so extremely bite, that he throwes him headlong to the ground, sucks out what honey he findes, and goeth away conqueror. In the top of *Cartmel* hills *Penninus* affirms in his papers, that he saw it as long as the fight lasted; but the fortune of the battle falling to the Flies, the Humble-bees were put to the worst and slain. And thus much of the *Zoophagi* or the Flies that live upon living Creatures.

The *Azoophagi* so called, are those that make their living out of creatures without life, and those are either on the land, or in the water: of the land Flies, some feed only on the earth and the dew of it; others of plants, herbs, and flowers growing thereon. The one I call (in a term of my own) *Ground-suckers*, *Humisuga*; the other, *Heare-eaters*, *Herbivora*. The *Humisuga* or *Ground-sucker*, hath a dun coloured body, in the head toward the mouth, a whitish shining spot, the belly and feet black, at the coming forth of the wings on both sides a white spot, the back grey, in the shoulders according to the length of them four sullied white lines, the wings silver, and (if they be put into the water) shining like the glo-worm: it is found in foot-paths, and

Mole-

Mole-heaps newly turned up; for it loves the ground that is made plain and smooth with treading on, and therefore called in English the *Gray-path Fly*: it seldome comes upon flowers, especially at what time the Mole casts up fresh earth, of the juice whereof it is sustained.

Of the *Herbivora* or those that feed on herbs or flowers there are divers sorts or species; whereof three are like the Bee termed of *Lucian* *σαλάνης*, military or war flies. In regard they are bigger, lustier, and stronger, very specious to look on, very gallantly set out with two silver wings. The first and chief of these hath a blackish head, the middle of the back being cut crosswise with two overthwart lines, the end of the tail black: the body otherwise mud colour. The second not much unlike, the head blackish, the shoulders according to the length of them drawn with three yellow and black lines, the rest of the body marked alike and with the same colours. The third and least of these, the shoulders are rough and yellow, the head red, the rest of the body is divided with four yellow and four black lines going across it. The bodies of all of them do glitter, and as if they had nothing in them are transparent. They are conversant in gardens, sucking the juice of the flowers. *Lucian* describes these military flies thus: There are a kinde of Fly which some call Military, others Dog-flies, that make a very harsh and shrill noise, and fly exceeding swiftly. These are very long lived, and continue all the winter without meat, especially when drawn together, and fastened to ridges and tops of houses.

In whom this is most worthy of admiration, that both of them do the naturall office both of male and female, like the Son of *Mercury* and *Venus*, who was of a mixt nature or *Hermophrodite*.

Much like to these is there another Fly called *Apiaria*, of a shining black, having two wings, gathering wax, and fastening the juice that he hath gathered from the flowers to his hinder legs, as the Bee doth: He comes abroad in Autumn, and is seldome seen at any other time. Whether this be that which *Arist.* calls *Sirenis*; it differs certainly in the number of wings only, for that he makes to have four wings, whereas Nature hath afforded this but two.

There are other sorts of Flies, that devour herbs and flowers, that are not like Bees, to wit, the *Struthiopteri*, *Eninopteri*, and *Chelidonii*, because it is like to the Swallow. Of the *Struthiopteri*, I have seen three sorts. The first whereof is tender and soft, six footed, with two wings, the belly longer then ordinary, sending forth from the head a little above the eyes two feathers like Ostriches feathers, as it were horns of a downy softnesse, as soft as any feathers whatsoever; crump shouldered, all the rest of the body white, longer then the wings which are black. The second is of the same colour, whitish, the head of a dusky colour; otherwise it differeth little or nothing at all from the former. The third is all alike, only the horns are not so soft and downy; the tail is white, the body long, with five white lines going athwart it, the feet long, marked with black and white colours: as it goeth it listeth up the tail a little, and softly claps his two transparent wings together. These three species do appear in the Spring time with the first, in gardens, hedges and shady places very frequently before and after rain.

The *Erinopteros* is a fly all over white or rather silver colour, small and every where downy; inasmuch as when it sits upon a flower, if you look not hard upon it, you would think it were a feather; the wings of it are divided, the feathers being severed one from the other almost like Birds wings. *Pennius* received one of these painted, from *Edmund Knivet*: afterwards he often saw them in hedges, and places set with privet.

The Fly called *Chelidonius*, is swifter of wing then all the rest, sides, tail, head, brown and hairy, the eyes black and hanging out, the bill or rather the nose picked, out of the top of which start out two horns; the top of the shoulders as also the back black, two silver wings, the forepart whereof do answer to the blacknesse of the feet: sometimes it sits in one place for a great while together, as if it were immovable, but as soon as you come near it, its out of your sight before you can say, What's this? and will not yeeld a jot to the Swallow (from whom it hath its name) for swiftnesse of flight. *Pennius* received another flower-Fly of the learned *Carolus Clusius*, black, having two silver wings, two dainty white eyes in the back, having seven yellow spots, in the midst whereof is to be discerned a speck of black. There are Flies that are found in beans, of sundry colours, but especially of a pale purple, which I conceive do come of the smal worms called *Mida*. For when they are gone (which is in the midst of Summer) suddenly there comes forth a great number of those Flies swarming amongst the Beans. The Fly of *Napellus* I have not seen, but those that come out of those black grains that stick to the stalk of the wormwood, much less than Millet seed, more black than any Moor, only famous for their wonderful smalnesse.

There is a certain Fly called *ephuseus*, very rare and wonderful, whether you respect the form or the shortnesse of its life. It hath many names: *Ælian* calleth it *ephuseus*; *Hesychius*, *μωήμυς*; of others it is called *μωήμυς*; in Latine, *Diaria*: it moves with four wings and as many feet; for that it hath not peculiar to it in regard of the shortnesse of its life only (saith the Philosopher) but also as it is a four footed creature, and a flying creature. It comes forth with the Sun, groweth, flourisheth, languisheth, and dieth the same day with the Sun setting. In the time of the Summer Solstice, these diary creatures break forth out of certain husks of putrefied grapes, which husks (or such as seem to be so) whether they are a kinde of *Aurelia* proceeding from some kinde of canker-worms living in the water, it is not easie to shew; for in that particular the Philosopher is silent, from whom most of this story is gathered. *Pliny* calls them thin membranes; *Aristot.* small bottles, and saith they are common to be seen in the River *Hippare*, by the *Cimmerian Bosphorus* of *Pontus*. They live a life both short and sweet, for they live not beyond the space of a natural

natural day, and in the evening they put an end as to their lives, so to their miseries. In the mean while they are sustained and kept alive with their own radical moisture, neither are beholding either to air or earth; hence we may gather the length of their life, yea rather admire and wish for it. These Insects *Cicero* speaks of in the first of his *Tuscul. Questions*: these also *Matthias Michoides* in his 2. *Book de Sarmatia Europea* describes in these words, You may take notice (saith he) that in the Rivers of *Russia* and *Lituania*, especially in *Boristhenes* and *Borus*, in the Summer there are a great company of the Flies called *Ephemer*, or Day Flies: they are Worms and Flies both, some have four, others six wings; in the morning they run upon their feet over the water, about noon they fly about the banks, the sun setting, as many as were bred that day dye in the self-same day. Which description doth much differ from *Aristotles* History of them, first because in the morning it is a creeping worm, then about noon a fly altogether, besides that he giveth to some six wings contrary to the minde of *Arist.* *Jul. Scaliger* in his learned *Exoterick Exercitationes* against *Cardanus*, describes this Fly after this manner: I have observed a kinde of Fly frequenting *Sarca*, and the Lake of *Bennacum*, called *Ephemerus*, in the evening, but never any in the morning; being taken it lived only a night: it hath four very long wings, how many feet I know not; but if it have six (for I do not remember how many it hath) it sufficeth: it hath a head like a Fly, great eyes, the snout or beak rolled up together, the belly large, the tail exceeding long, and full of joynts, in the end forked, in some three forked, of colour a darkish yellow in the bigger sort, in the lesser of a brown or dunnish, very specious. The *Taurini* call this insect *Monietta*, as they would say *Monachella*. The *Adriatick* about *Meranum* and *Tergeste*, call it *Cazotulum*; of my Countreymen it is called *Sitivolus*, i. e. *Sagitella*. *Alian lib. 2. de Animal. c. 4.* sets forth another kinde of these Insects, such as are bred of sowre wine Lees, which when the vessell is opened come forth, and the same day, for nature hath given them a beginning of life, but in regard of the many miseries to which it is incident, quickly freeth them of it, before they can be sensible of their own, or any others unhappiness. But yet what these Flies of which *Alian* speaketh be, unless they be those that we call *Bibiones*, I know not: for that our Vintners know of no other bred in their cask.

But *Scaliger's Ephemerus*, I should rather have reckoned amongst the Flies called *manesupres*, had not he himself referred it to this Classis. I shall not think it much also to speak of *Pennius* his *Triemerus*, or a Fly living three daies, for the likenesse of the one with the other, that so the mindes of the studious may be filled with variety and rarity. It is of body very long, and somewhat like a Butterfly, the head little and yellowish, the eyes great, black, standing out of the head, the *promuscis* or beak winding in; of the colour of yellow mulleins, with which it sucketh dew from the flowers; two black cornicles fastened a little above the eyes, the back and belly blewish, the end of the tail dunnish; it hath only four legs, the hindmost whereof are yellowish, the edges of the foremost black, it hath as many wings as feet, the outermost whereof are pale, wan, the utmost borders of them being of a dark yellow, the innermost of a brightish yellow. The outer wings when they are closed together for to cover the body, they are so contiguous, that you can hardly, yea very hardly perceive where they touch; it flies heavily, and continues but a while in flight, within three daies it expires, it lives amongst Mallows and Nettles, this was found at *Peterborough* in England in the year 82. witnessed by very honest men and without exception. Thus *Pennius*.

In flowers, or rather the buds of the flower called white Bets, there is a kinde of Fly that eats the flowers, very small, I know not whether bred there, or coming thither from some other place. It seems they abide there for warmth sake and feeding. *Pennius* saith he was informed of this by his most learned friend Dr. *Brown*. I thought good to place the Fly *Bibio* in this number, because it is nourished by Wine, i. e. the clear juice of the grape (of which also it is bred). In the Illyrian Tongre called *Vitis rebate*; by the Germans, *Wein Worme*; in the English, *Wine Fly*. *Cardanus* calls it *Muscilio*; *Scaliger* not amisse, *Voluceffam*, and *Vinulam*; for it flies into cellars often, cares for nothing but wine. If you take it and look upon it, you would think it had no snout or beak at all, and yet it is reported that they will strike through a Cask made of inch board, insomuch that the wine sometime runneth all out. It may be *Grapalus* meaneth these, when he writeth thus: The *Muscilla*, *Muscule*, *Musciones*, Flies bred in Autumn in the mother of Wine, and soiling the Wine-cups, do not live so long (and that deservedly) as to come upon the table in the winter. In the West Countrey in a Town called *Tanton*, in the fruit of an Apple tree called *Velin*, in the Summer being rotten to the Core, there is found a glistering fly of a green colour; which when the Apple is cut in twain flies out, and seemeth to be bred there of some kinde of worm that is in it.

The wounds made by any of these Flies, must be anointed with bitter Almonds bruised, or Remedies against Fly-bitings, Walnuts; when ulcers are made, it is fit to pour on liquid Pitch boyled with Hogs-grease. Those things that kill and drive away the Tyke-flies called *Ricini*, for the most part, kill and drive away the Dog-flies. *Columella*.

The Fly also by his boldnesse and saucinesse, hath taught men how to provide remedies against them; for whereas both at home and abroad, every where they were so troublesome, that nothing could be so safely kept by the Cook, but presently they would be at it and spoil it, yea all kinde of meats whatsoever, they now use to strew or stick up in their houses, or boyl and mingle with such kinde of things as Flies love, Nigella seed, Elder, Lawrel, Coriander, Hellebore, Buglosse, Borage, Sage, Beets, Loose-strife, Origanum, Basil royal, Henbane, Licebane, Balm, &c.

shrub having a flower like a Rose, Pepper, Ferula, Cockle, Libbards-bane; some give them Orpiment powdered with Milk or sweet Wine, and sprinkle it about. *Rhasis* writeth that Crocodile Broth chafeth away Flies; who also commends the perfume of yellow Arsenick, with Olibanum, perfume of Vitriol, writing Ink tempered with water wherein Wormwood hath been washed keeps the flies from the letters. *Plin.* The seed of Henbane, black Ellebore, and the Froth of Quicksilver with Barly flower beaten and kneaded, and made into little morsels with Butter or Grease, and smeared with a little honey, and so cast to the flies kills them. *Actius.* The gall of a Hare mingled with milk, or boyled in water, and sprinkled about the house will chase away all the flies. *Anonymus.* Flies are destroyed with the smell of Wine distilled with the herb Balm. *Lullus.* If you would gather flies together into one place, cast Rhododaphne well bruised into a ditch; the juice of the herb Ferula sprinkled worketh the same effect. *Actius.* Bury the tail of a Wolf in the house, and the flies will not come into it. *Rhasis, Avicen, Albertus.* Boors grease and Rosin melted, entangles them, Oyl chokes them, Verdigrease kills them outright. If you anoint any thing with Cassia beaten in oyl, it will be safe from flies. There is found in my Countrey (saith *Petrus Cressentius*) a kinde of Toadstool or Mushrome, broad and thick, reddish about the top, which sendeth forth certain knobs or little bunches, some broken, some whole; it is called the *Flies Mushrome*, because when it is made into a pulstels with milk, it destroyeth the flies. If a man hold in his hand the stone *Heraclites*, or the touchstone, although he were dawbed all over with honey, yet will not the flies come at him, & by this means you may know whether the touchstone be true or no. *Actius.* They write that the K. of *Cambayes* son was brought up by poyson, who when he came to years, was all over so venomous, that flies at once sucking were swoln to death. *Scaliger.* If the fly get into one eye you may shut the other hard and it helpeth. *Aphrodisius in Problem.* If Camels chance to be stung by the *Tabanus* or *Afilus* (a kinde of Fly so called) as it often cometh to passe in *Arabia*, anoint them with Whales greate and all sorts of fish, and they will presently be gone. *Plin. Solon in Geoponicis*, biddeth to sprinkle cattel with the decoction of Bay-berries; and both these flies through a kinde of natural antipathy depart forthwith. If cattel be already stung with the *Afilus Fly*, anoint them with Ceruse and water. The *Tabani* will die (saith *Ponzettus*) when you set before them Oyl of the decoction of land Crocodiles called *Scienci*, bruised, with Hogs seam & the flour of soot. Moreover let cattel be led to pasture in the evening, the stars guiding them, in the day time let them be kept in folds with boughs laid under them, that they may lye the more easily and quietly. *Virgil.* Or else let them be brought to the sides of thick woods where these flies by reason of the dulnesse of their sight cannot fly so freely. Sundry kinde of remedies against flies *Ruellius* upon *Hippocrates*, as also *Apollonius* and *Brixius* have prescribed more remedies against flies.

Now after what manner Flies do execute the Justice of God, let us briefly set down. No Age but will speak of that famous Army of Flies, with which that great Lord of Hosts of heaven and earth did of old correct the fury of *Pharaoh*, and of the *Egyptians*, being joyned with hardnesse of hart; and yet the wicked Hypocrite did not come to himself, but wallowing still in the mire of sin without any sense, did afterwards invite greater and more grievous judgements to fall upon him. And that proud young gallant, who would needs ride to heaven upon his winged steed, was dismounted and cast down by the Fly called *Oestrus*. *Hercules* also, although exceeding in strength, the Poets inform, that he was almost vanquished by flies. In the time of K. *Rivallus*, when as corruption of manners, and guilt had infected *Britany*, there came down from heaven showres of blood, and those being dried away, did produce swarms of poysoned Flies, who if they did but once bite any man he presently died, as our Annals report. *Nicolaus Albanopolitanus* an English man, being elected Pope in the year 1154. called by the name of *Hadrian* the fourth, was choaked with a Fly flying into his mouth. *Urspergensis.* Others say that he was killed with drinking a draught of water in which a fly was drowned: and that by the just judgement of God, who excommunicated *Frederick Cesars* (whose surname was *Barbarossa*, or *Enobarba*) and did incense all the Princes of *Italy* against him. *Nauclerus* out of *Johannes Cremonensis*. An ancient writer reports also, that the Army of *Julian* the *Apostate* was grievously infested with mighty swarms of flies; and *Grillus* saith that the *Megarenses* were by them driven from their habitation. In the year 1348. great numbers of flies dropping out of the air, did cause in the Eastern Countreys incredible noisomnesse and putrefaction; upon which followed such a Plague among the people, that scarce the tenth man among them was left alive. In the year 1091, wonderful store of strange flies did fly up and down many Countreys, who did sundry waies hurt the grasse, trees, cattel, and men also. *Cranzins.* In the year 1143. a sort of fly about the bignesse of the common sort of flies, only of somewhat a longer body, did so fill the air, that for many miles together the Sun could not be seen, which were also very troublesome. *Urspergensis.* In the year 1285. *Charles* King of *France* leading an Army into *Spain*, and making war with *Peter* King of *Aragon*, an Army of huge flies of divers colours set upon the *French*, and slew them with their beaks, as it had been with swords. *Marineus Siculus* l. 11. de *Hisp. Reg.* In the year 1578. about the middle of *August*, upon the top of the Temple of *Brumbium*, there fate every year a swarm of flies which made such a noise with their wings as if they would throw down the roof: *Timothy Bright* told this to *Pennius*, a Physician, a man both learned and vertuous, and of no small note with us. Hithet may be referred that which *Strabo* reports, lib. *Georg.* 3. That amongst the *Romans* a Plague did often happen by reason of them, insomuch that they were faine to hire men of purpose to catch them, who were payed according to the quantity more or lesse that they caught.

caught. But how greatly they annoy the inhabitants of *Africk*, *Apulia*, *Spain*, *Italy*, and the *West-Indies*, how grievously they sting and wound the *Carthaginians*, and the inhabitants of *Hispaniola*, besides *Oviedus*, let those Englishmen speak who accompanied that flower of Knighthood, and Maul of the *Spanish* pride, *Francis Drake*. As for those things which *Apollonius*, *Fulgensius* and *Pliny*, fabulously and superstitiously relate concerning Flies, I thought them unworthy of this place; and therefore those flies called *Pisatides*, *Cypria*, *Eliades*, *Actea*, and the rest of meer invention I pass by. It shall not be from the matter to tax in brief the madnesse of the ancient Gentiles, that we may thereby be taught to lift up our eyes to the true *ἀμύσιον*, the God that doth indeed keep flies away from us. It is said of *Hercules* in performing divine Worship, whereas he was almost killed by the Flies, that he offered sacrifice to *Jupiter*, called *ἀμύσιος*, or the Fly-way-driver, by which means they were presently dispatcht into the River *Alpheus*, from whence he was afterwards called by the name of *Muscarinus* or Fly-killer.

The *Eleans* did invoke *Myagrus* and *Myades*, that multitude of Flies might not cause a plague amongst them. *Pliny*. He relates also how the *Cyrenaicks* were wont to worship *Achor* the god of Flies, that by his means they might be secured from being troubled with them. *Pliny* more truly might have read this name *Acaron*, or *Ishekron*, in stead of *Achor*, if he had heard of the Town *Acaron* where *Bahal-zebub*, i. e. the god of Flies, that famous Idol used to be worshipped. *Urspergensis* saith that the Devil did very frequently appear in form of a Fly; whence it was that some of the Heathens called their familiar spirit *Musca* or Fly: perchance alluding to that of *Plautus*:

Hic pol musca est, mi pater,

Sive profanum, sive publicum, nil clam illum haberi potest:

Quin adsit ibi illico & rem omnem tenet.

This man O my Father is a Fly, nothing can be concealed from him, be it secret or publick, he is presently there, and knowes all the matter.

But away with those false and filthy gods which the Greeks therefore called *τυροδαιμονας*, because they did serve for bugbears perhaps for children, and ignorant and heathenish people, which we that are Christians, and professe the true Creator of all things, ought not at all to regard.

There is also said to be another use of flies. For *Plutarch* in his *Artaxerxes* relates that it was a law amongst a certain people, that whosoever should be so bold as to laugh at and deride their Lawes and constitutions of state, was bound for twenty daies together in an open chest naked, all besmeared with honey and milk, and so became a prey to the Flies and Bees, afterward when the daies were expired he was put into a womans habit, and thrown headlong down a mountain: which place of *Plutarch* (by the Translators leave) I think should be interpreted not *Ciphone vinculus*, but *unctus Cippi*, anointed with sweet smelling oyntment. Of which kinde of punishment also *Suidas* makes mention in his *Epicurus*. There was likewise for greater offenders, a punishment of Boats, so called. For that he that was convict of high Treason, was clapt between two Boats with his head, hands and feet hanging out: for his drink he had milk and honey powred down his throat, with which also his head and hands were sprinkled, then being set against the Sun, he drew to him abundance of stinging flies, and within being full of their worms, he putrefied by little and little, and so died. Which kinde of examples of severity as the Ancients shewed to the guilty and criminous offenders; so on the other side the *Spaniards* in the *Indies*, use to drive numbers of the Innocents out of their houses, as the custome is among them, naked, all bedaubed with honey, and expose them in open air to the biting of most cruel flies. But for these things let *Nemesis* answer, who is at the back of cruel miscreants, yea may be said every moment to be present with them.

To conclude; the last use of Flies (and that not to be contemned neither) appears to be this, that whereas none of them passe a Summer, yet some of them do not live out a short day, we should by them be put in minde of our own frailty, and of the uncertainty of this vanishing life; the which although preserved with all the dainty food that can be got, with the softest raiment, and all the best waies and means that may be for a short space, yet when it seems most to flourish, it on a sudden declines and scarce with the fly holds out an Autumn, much lesse a Winter; we are in *Pindars* account but *ἐπιφύεσι*, *Daiesmen*, i. e. of a daies continuance, and as the dream of a shadow. And with the flies, short liv'd, yea shorter liv'd then they, for the most short lived of them liveth a day, whereas we have young children that survive not sometimes the fourth part of an hour. Away then thou Tyrant whoever thou art, make lawes as thou pleasest, persecute the godly, add impudence to thy strength, trouble and confound all things, give thy self up to all abominable and filthy lusts; yet at length *Jupiter* shall scare away these flies, and after thou art dead exercise thee with variety of torments.

CHAP. XIII.

Of Gnats.

THE Gnat is called in Hebrew Arabick, *Heagi*; in Italian, *Zenzala*, *zinzala*, *sanlara*, *sanlara*; in Germane, *mock*, *m' n' ucke schnack*, *stinger*, *braem*; in Flanders, *Mesien*; in Polony, *Komer*, *Welchicomor*; in Muscovy, *Coomor*; in Spanish, *Moxquite* & *mosquito*, whence our seamen call it a *Muschite*; in French, if it be lesser, *Moncheron*, if greater, *Bordella*; in English, if bigger, a *Gnat*, if lesser, *Midges*; in Latine, *Culex*, perchance from its sting as *Isidor* saith, or from the word *culeum*, which signifies the same with *corium* a skin. But if I might be bold to give the Etymologie, I should rather read the word *cuticem*, not *culicem*, a skin fly, because it most affects that: whence by way of Hieroglyphick it signifies a *Letcher*; because as the Gnat covets the fairest skin, and strikes till blood come forth, so doth the Letcher: which *Plautus* seems to intimate, when as the Parasite, if I am not deceived, takes up an old fornicator for kissing his mistress too hard after this manner: *Eho tu nihili, cane culex, &c.* What, art thou not ashamed thou gray-headed Gnat? I can scarce forbear to tell thee thine own.

The Greeks have no general word that comprehends all kinds of Gnats; as on the other side the Latines want words for particular Gnats, with which the Greeks abound. Of the Greek words, *κέρως* seems to be most comprehensive, whence the *Oetians* worshipt *Hercules* by the name of *Cenopius*, because he was thought to have driven all the Gnats out of their Countrey. The same *Alexandrinus* witnesseth that *Apollo* was called in *Attica* *Culicaris*. The *Bæotians* worshipt their god by the name of *Apollo Parnopius*, because he drove away their Gnats called in their language, *πρόπιος*, so *Pausanias*. But since the Greeks have one herb they call *κωλίζα*, i. e. *Culicularia* or Gnatbane, a remedy against all sorts of gnats, *κέρως* doth indeed seem to be the most general word. That is evident by the network coverlid spread on beds, taken from the Greeks which they call *κωλπιον*, and we also at this day name not much unlike, a canopy, a thing to catch all manner of Gnats.

The Gnat seems to be a kinde of Fly, yet as flies love sweet things, Gnats love things fowre and tart. The Flies do couple, the Gnats do not. They are most troublesome in the day time, these in the night, they make a kinde of a dull humming noise, these sing shrill, loud and pleasantly.

The Gnat hath two wings, for the bigness of his body great, coming forth of his crompt shoulders, he hath six long crooked scrambling legs going in and out, growing from his prominent square breast, with which as *Arist.* saith, they with the more ease lift up their bodies and go the better; he hath a very long body, as also a snout or *proboscis* three times as long as the Flies have, with the sharp point whereof he breaks through the skin, and with the hollownes of his trunk he sucks blood, which he makes use of in stead of a mouth and a tongue. *Pliny*. He makes a terrible found and great, for the bulk of his body, so that *Homer* in his *Batrochomyon achia*, makes them to give the signal for the fight. *Aristophanes* in his *Nubibus*, in derision of *Socrates*, brings in *Charephos*, demanding whether the Gnats make that found with their mouth or with their tail. Yet in his *Avibus* he terms them *ὄξύπους*, which the Scholiast expounds *ὄξύς* *δύς*, *shrill singing*. Their *Proboscis* (saith *Pennius*) seems to be given them by nature to suck blood and to feed themselves withall; but we may not assent to him in this particular, even reason is against it, for that the Gnat when he turns towards one sings more shrill, but in turning away more flat; which could not possibly be, if they made their found with their tail.

Καὶ τὸς κέρως
πρὸς μεγάλης
σάλπιγγος ἑ-
ρφέας,
Δειδὼν ἐπὶ λ-
αζὸν πολέμου
κ' ὑπὸν, &c.
And then the
Gnats with
their great
Trumpets
sound alarm to
the battle.

The structure or make of the Gnat there is no man but with *Pliny* may justly admire. For in these so small Insects and as good as none almost, what reason is there? what force? what inextricable perfection? where hath nature placed so many senses in the Gnat? where his sight, where his taste, where his smelling? where is begotten that terrible and great found which that little body makes? with what curiosity are the wings fastened, and the shanks and legs to the body? an empty hollow place for a belly which caueth such a thirst after blood, of mens especially? but their dart wherewith they pierce the skin, how sharp is it? as in the biggest it cannot be perceived, so it is doubled with reciprocal art, that it might be sharp to break through the skin, and fistulous to suck the blood.

Their manners and conditions are very ill disposed, both in regard that by their good will they will wound none but the fairest; and also those that are asleep, harmless and thinking no hurt. Whence groweth the proverb of a very ill conditioned man, that he is *κέρωπος ἀδωδέος*, more mischievous than the Gnat. The Gnat certainly is a very mischievous little creature (to use *Ælian*'s language) annoying men both day and night, both with his noise and his sting; especially those that live near the fens or rivers. Of whom *Tertullian* against *Marcion*, and his fifth book speaketh thus: *Endure, if thou be able, the trunk and lance of the Gnat; who doth not only offend the ear with the shrillnesse of his sound, but with his lance strikes through the skin, yea and veins also.*

The distinction of Gnats is very perplex and obscure, it hath puzzled all the Philosophers; which with the doubtful sense of words in Authors have almost confounded the things themselves. But to me they seem to differ especially in magnitude and malignity. For there are these several sorts of them, the bigger, lesser, middlemost and least.

The

The bigger may be called *ἔλεος*, because they have their abode in fenny and marish places; there they are begotten, and there nourished, they have a very long slender body with two wings; which they never lift up above their body as the fly doth, but straight up from their shoulders, and those are very neat, polite and compleat as may be.

They abound in woods that grow near the sea and the fens, not only in *Norway*, *Russia*, and other extreme cold regions (as *Olaus Magnus* hath observed) but in the *West-Indies*, in *Hispaniola*, *Pern*; and in *Italy*, near *Eridanus*, *Padus*, *Adria*, *Argenta*, where great store and very great ones are to be seen, terrible for biting, and venomous, piercing through a three double stocking and boots likewise, sometimes leaving behind them impoisoned, hard blue tumors, sometimes painful bladders, sometime itching pimples, such as *Hippocrates* hath observed in his *Epidemicks* in the body of one *Cyrus* a Fuller being frantick. Nay sometimes the vein being struck, they do so suck the blood, that when they are gone with their bellies full, it would flow out in drops of its own accord, even as we see in horses when they are bitten of the fly called *Tabanus*. The *Italians* use to clothe themselves with leather for that purpose, but yet scarcely and not altogether by any means they can use, can they escape their stings. Whether or no these are the *Styges* inevitable of which *Theophrastus* speaks of in his Book *de caus. pl. f. cap. 4.* I have not to speak for the present (saith the learned *Scaliger*) and it appears that they are the same, for that they are not bred in a place of free, thin and open air, but are bred and fed about fens and standing waters, as about *Argenta*, and the mouth of *Padus*. But if the be *Styges*, they have found out a very fit name for them from their hatred and malice, which the word *σῆτος* doth import. But those which are in the hotter Regions, and live by the sides of rivers and fens, are of a more fierce disposition, and sting more cruelly, as *Massarius* hath informed *Gesner*, and our countrymen the *English* under Captain *Drake* in their expedition into *Hispaniola* felt by experience. There are others somewhat lesse then these, nothing differing in colour, form, and frame of body, but yet in disposition more milde, and sting lesse. In the Summer time they are in the shady places, in the Winter in snowy places neer hedges and bushes, sporting themselves in their swiftness of flight, and as it were trying the mastery in fleeing from this place to that. They seldome bite, and when they do bite they draw no blood, but only a little salt sweaty matter which they feed upon; which causeth only a little hard and itching pimple to arise. These two species are especially termed of the Greeks *κνέπας*, others there are notwithstanding which have other names.

There are in *England*, especially in the north part thereof, two other sorts of them, of a third and fourth bignesse, much lesse than the former, but amongst themselves not much differing in their dimensions. These like expert and well trained souldiers, alwaies march in an exact pyramidal Figure, and although in themselves infinite, yet not any one of them breaks his rank. Thus they move upwards and downwards, when as in the twinkling of an eye, and while you can say, what's this? they bring their Army into a square body, and presently again into wings; the which if you rout with a fly-flap, or with water sprinkled amongst them, or with a strong blast of breath, they will instantly rally again, and before you can give a fillip bring their whole body into a pyramidal figure. They being in great numbers, do much infest the faces and eyes of travellers, and bite them: so many and so frequent are they, that out of what kinde of worm they should have their original it cannot be imagined. Countrey people suppose them, and that not improbably, to be procreated of some corrupt moisture of the earth. These small Summer Gnats are most frequent in the moneth of *May*, and seem to be nourished with a watery vapour, for their intestine or ventricle is very small, white and welnigh invisible, full of a white frothy thin moisture, and of little or no tenacity; sometimes they fly farther off from the water, and gather themselves in great companies about houses, as men passe over bridges they swarm about their heads, they love places that are without wind, they shun what they can a turbulent air, for by the troublesomenesse of the air they are dispersed hither and thither. Those kind of Gnats are properly called in *English* *Midges*.

Now we are to descend to other sort of Gnats, according as their names are given them in the *Ἑλληνικῇ* Greek. The chief of these are these three, viz. *Ἐμπίς*, *Ἰν*, *Κνίψ*: of which in order. *Empis* is a *κνέπας* of a kinde of Gnat living about rivers, especially about rocks, girt about the middle with a streak of *πλάμας*, white. It maketh a shrill-like noise as the other kinds of Gnats do, whence *Charephon* in *Aristophanes* his *Nubibus* demands of *Socrates*, whether he thought that the *Empides* did make that sound *χῆν, χῆν* with their mouth or their tail? *Hesichius* also calleth this *Empis*, *ἐμπίς*, or *Oxe-eaters*, because being deceived by the authority of *Aristotle*, he thought the *Oestrus* Fly came from them: the which we have declared before at large that they were procreated of Swallows. *Ἡ δὲ Ἐμπίς* *πύρρ* in *ἡ δοναελδύ* &c. *Arist. Hist. 5. c. 19.* Which *Theodorus* Latines thus: *Calices Muliones ex Ascaridibus gignuntur, hoc est Tipulis.* The Gnats called *Muliones* are begotten of the *Asarides*, i.e. the *Tipule*. These *Tipule* for the most part come out of wells or standing waters, the earthly matter settling to the bottome; for the mud first of all putrefying, becomes whitish, by and by after blackish, last of all blood-red, when it is such, presently there come forth certain little red creatures called *Algula*, which remaining for a time, they move to their original, and afterwards come to perfection; so that the *Tipule* so called, are carried by the water, then a few daies after they heave themselves above the water, hard and without motion; not long after the shell being broken, cometh forth the *Empis*, and sits there, till either moved by the wind or the Sun he be able to fly. Thus far *Gara*. Neverthelesse (not to wrong a famous man) I should think it a very easie

matter to shew where in many things he is out. Why doth he translate the *Empides Mulinones*, who are said not to live above a day, and feed only upon honey? which must needs be hard for them to get so readily in Fens and Marishes. For I may well call (without wrong to the judgement either of *Pliny* or *Penny*) the *Mulinones* as they call them, *Melliones*, for they neither care for *Mules* nor feed on them, but only upon Honey, the which they can smell at a great distance; they have a bill like a *Wood-pecker*, long and sharp, with which they devour in honey so greedily, that at length they burst their bellies, and so presently expire. In this also did *Gaza* trip, to say the least that may be, that he translates the word *Ascarides* by the word *Tipula*. For the *Ascarides* (whether they come forth of the earth, or the water, or otherwise) every man knowes do signifie little worms. Besides, the *Tipula* alwaies keep the top of the water, seldome or never go down to the bottom. Last of all, when as the *Tipula* themselves come of the *Ascarides*, who can rightly say that *Ascarides* are the *Tipula*?

Τὸ παρέρχον
ἐργολαβία
ἀξιώμενον τῆς
ἀφύπνου.

Ψύχ, is called *Culex ficarius*, i. e. *Fig Gnat*, not because it comes indeed from the fig-tree, but because it is fed and sustained by its fruit. For it is sprung of a certain worm that breeds in the Figs, which when nature cannot make her perfect work upon, nor bring to the sweetness and perfection of other Figs, lest she should make something in vain, by a certain quickning vertue, out of the grains of them being rotten and putrefied, she produceth these Gnats. Yet not so, as that the *Gnat* is the *παρέρχον*, or besides the intention of Nature (as *Scaliger* hath learnedly observed) or if it be, the truth is, the work by the bye is of more dignity than the main. Nature did propose to its self the perfection of a wilde Fig, a thing not so much to be esteemed of: this she being not able to bring to passe, turns her self from so common a work, to an enterprise of greater weight, and produceth a *Gnat* which she effecteth. Concerning those Gnats *Pliny* hath these words: the wilde Fig-tree brings forth Gnats, these being defrauded of the nourishment they should have received from their mother, being turned to rottenness, they go to the neighbouring Fig-tree, and with the often biting of the same fig-tree, and greedily feeding upon it, they let in the sun withall, and set open a door for plenty of air to enter in at. Anon after they destroy the milky moisture, and infancy of the fruit; which is done very easily and as it were of its own accord: and for that cause the wilde fig-tree is alwaies set before the fig-trees, that the wind, when the Gnats fly out of them, may carry them amongst the fig-trees, who as soon as they come into them, the figs swell and ripening of a sudden grow very big and full. Whence it is that the Greeks to expresse a woman great with childe and near her time (yea or newly conceived with childe), call her *ἑλκυσίλω*, *Gnat-bitten*. Those kemb'd and curle lockt *Pathicks*, and prostitutes of unnatural lust, were called from hence *Capifricati*, as witnesseth the Greek *Iambick*, *ἑλκυσίλω* κομῆς ὅστις ἑλκυσίλω, *Nemo comptus nisi Caprificatus*. There is no man that curls and trims his locks that is not *Caprificatus*. To this *Caprification* *Turnebus* thinks that *Adrian* the Emperor did allude, when he upbraids that effeminate Poet *Florus* with his *Pathick* obscenity under the term of *round Gnats* in a most bitter *Sarcasm*:

Florus had said,
Ego nolo *Cæsar* esse,
Ambulare per *Britannos*,
Scythicas pati pruinās.

To whom *Cæsar* answereth,
Ego nolo *Florus* esse
Ambulare per *Tabernas*;
Latitare per popinas,
Culices pati rotundos.

In English thus:

I would not *Cæsar* be
To travel *Britany*,
To suffer *Scythian* cold.

I would not *Florus* bee
To walk the *Taverns* free
In *Sculking* *Brothels* hide,
Or the round *Gnats* abide.

But what time these Gnats passe from the wilde fig to the fig-tree, they do it in such haste, that many of them leave either a foot or a wing behinde them. Now that they generated of the grains of the unripe fig, may be evident in that the wilde fig is left void of grains.

Cnips (some call it *ακνίς*) so called of the Greeks, *ἀπὸ τῆς κνίσης*, from biting or stinging, (for that the twinge the flesh, and with their biting cause an itching in the same) is a very small Gnat, not unlike the *Conops*, who although by his sitting upon the Fig it may seem the same Gnat spoken of before, called *ἑλκυσίλω*; *μάστιγα* ἐν τῷ σπυρί (as *Theophrastus* saith) *ἡ δὲ κνίση ἐν τῷ γλυκύνῳ* ὕδατι. *τῆς δὲ κνίσης φλοῖον συνιστάμενος*. Which place *Pliny* interprets thus: There is a kinde of Gnat very offensive to certain trees, as to the Oak, of whose moisture that is under the bark they are thought to be bred. *Theophrastus* calls all those *κνίπες*, what ever they be that are bred in the Elm, *Naven*, *Rapes*, *Poley*, the *Mastick*, *Turpentine*, and other trees, either with putrefaction or otherwise. These or the like, but a little bigger, *Cursus* in his 13. Book, saith are very hurtful to the orchard *Walnuts*, which are called of those of *Lions*, *Bordella*, *Bordells*. *Galens* opinion is, they are great devourers of *Grapes*. The moisture of the Elm included in its first growth in the leaves, or rather bladders, if it dry up, is changed into these *Cnips*. In the Autumn it brings forth other kinde of Gnats, many, small, and black, called *Canchryes*. *Symphorianus*. They do especially haunt and spoil watered gardens, the crop and scrape most kindes of herbs. *Velarandus Insulanus*, an Apothecary at

Lions

Lions hath observed them very frequently to come forth of the middle or heart of the Oak Apple, having a hole made into it: as also out of divers other herbs, not so much by reason of putrefaction, but rather out of the alteration of certain principles being digested into a better nature by successive labour.

Origen upon *Exodus*, saith that with these little creatures God did the third time take down the proud heart of *Pharaoh*: the which are hung in the air by the wings, but yet as it were invisible, and do so subtilly and quickly pierce the skin, that the fly which you cannot perceive flying, you may feel stinging. So all the ancient interpreters following *Origen*, expound the word *alates*. Only *Tremellius* (a very faithful interpreter of the Hebrew Text, and of sacred Writ) is of another minde, who thinks this plague to be a swarm of such kinde of creatures, as if the Gnats and all other venomous and stinging flies joyning all their forces and coming together in troops and swarms; had agreed as being sent by God to break the pride of the *Egyptians*.

They fly in the air aloft in manner of an Obelisk or Pyramide; especially in the evening, they play up and down by hedge sides, when it is hot and fair weather, they fly in the sun-shine, against rain in the shade. It may be they are the same with those we call *Midges*, and doth not much differ from that which *Albertus* calls *Schaggen*; the Italians, *Zenzalis*; the Heathen, *Cinifes*. There is a kinde of Gnat which the Greeks call *κνίς, κνίσις*; the Latines, *Herculei*; in sloth and malice like to Drones, and never wound or hurt any but those of their own name and alliance; for as soon as they perceive other Gnats full of blood and moisture, after they have fought with them, they take them for their prey and eat them; whereas they live idly and do nothing else but seek for their food gotten by the labours of others. Our Ancestors have observed a kinde of Gnat to be bred in the fowre Lees of Wine. Which because they are not heard to sing or make any noise, I had rather think them to be those which *Scaliger* calls *Vinnula Mascilionis*, Wine-flies. Nor do I passe for the opinion of *Niphus*, in regard they desire fowre things, and refuse sweet: when as he himself saith elsewhere, that they are fed chiefly with the juice of Ox-dung, than which nothing can be more sweet.

The English Gnats are not so stinging as others, nor do they raise so great pimples, but the lesser sort of them is the more cruel; and yet they leave nothing behinde them but a little itching spot, like a flea-biting. The Gnats in *America*, especially those they call *Yetin*, do so slash and cut, that they will pierce through very thick cloathing. So that it is excellent sport to behold how ridiculously the barbarous people when they are bitten will frig and frisk, and slap with their hands their thighs, buttocks, shoulders, arms, sides, even as a carter doth his horses. The Gnats about *Terra incognita*, or *New-found-Land*, and *Port Nicholas*, as also in divers other Northern parts, are to be seen in great numbers, and of an extraordinary bignesse, as the Sea-men and *Olaus magnus* affirm. The cause of their multitude *Cardanus* attributes to the unintermitted heat and the length of the day. The cause of their bignesse to that watery and and unctuous moisture which was gotten together by reason of the long cold. But forasmuch as in the hotter parts of the *Indies*, as *Ovidius* (and experience) testifieth there are altogether as great, and many more sorts greater and store, *Cardanus* may well satisfie himself, though he cannot do me.

Of the Generation of Gnats Natures secretaries do diversly dispute: *Albertus* saith their material is watery vapours. *Aristotle* denies that Gnats should be generated of Gnats unless by means of a little worm as Flies are. But since that they do not use copulation, I do not perceive how that can be. *Plerius* was the first that taught how that Gnats do come of certain worms breeding in wood, when as yet every man knowes that Gnats are produced of worms in the *Nave*, *Privet*, *Mastick*, *Turpentine*, *wilde Fig-tree*, and other like Trees, as if seed were sown, and that not by way of putrefaction, but animation.

I did chance to finde (saith *Bruerus*) in a dirty filthy ditch an Insect with very long feet, which for the likenesse of the form, you would say was one of the larger sort of Gnats coming forth of a soft leathern purse. I did imagine that it might be bred of some worm like unto the canker shut up therein; for the shell within was such as those the cankers transform themselves into; Whether it should be called *Culex*, a greater Gnat, or *sigog*, it is doubted by the Author. To these (as to all other the like hurtfull Insects) the merciful Creator hath granted but a very short life, inso much that they which are bred in Summer never live till Winter, and they that are bred in Winter never see a Summer.

Yet notwithstanding God hath created them for divers uses, whether we respect God himself, or other creatures, or our selves. For not only *Mynatii*, *Mynsi*, *Astabarani*, *Arrhetenses*, *Gua-vicani*, were by the just judgement of God, driven out of their cities into deserts and solitudes, as *Pausanias*, *Leo Afer*, *Alian*, and the *Indian* Histories relate: but even the *Egyptian* Tyrant, of all that ever the earth bred, the most cruel, (as the sacred Scriptures that are more ancient then all the Heathenish *Jupiters* or other gods, do testifie) was vanquished with an Army of these. The least of those the Pope could not rid out of his throat, but was with one of them miserably choaked. With what a fiercenesse did they charge the Army of *Julian the Apostate*? how did they make him turn his back, and fall down dead? Let Apostates from the faith consider, and weigh the matter well; let them think more seriously of the strength, power, and majesty of the Creator, when as they see such cruel stings and more sharp than any poynard whatsoever, to be in such an abject contemptible creature as this is. Neither doth God make use of them to punish wicked and ungodly men, but also for the preservation and safety of mankind. For about *Meroe* and *Astaboras*,

The Generation of Gnats.

The Use.

Astaboras, as *Strabo* reports, so great is the plenty and fierceness of the Lions, that unless they were chased away by a great kinde of Gnat (that troops up and down all that Region) they were not able to live in safety, nor in the most fenced Cities from their invasion. The same is wont to happen in some parts of *Mesopotamia*, as *Ammianus Marcellinus* writeth, where the Lions being stung with the Gnats, and defrauded of any remedy against them throw themselves headlong into rivers, and are drowned in the deep. To the *Egyptians* also, although sometime they were deadly enemies, yet are they now auxiliary to them, as *Herodotus* writeth, in that they wound and sting to death the young *Axilla*, before they get feathers, being noxious to them. Moreover were it not for them, the whole species of *Bats*, *water Frogs*, and bank *Swallows*, which prey upon the Gnats and feed only upon them, would perish. But whereas *Gaza* saith that the Bird called *Cnipologus* (a kinde of Wood-picker with an ash-coloured back) doth eat Gnats doth not agree with their nature. For that kinde of Bird feeds on a little worm that breedeth in the rotten wood, called *Cossus*, the which he picketh out with his bill: He was deceived, it seemeth, by the Amphibology of the word, which signifieth both those worms, and Gnats also, for so are they called in Greek *xims*. But if there were such a Bird, I should affirm without all doubt that it is the *Nycter*, which by *Hesychius* and *Varinus* is called *Konopothera*. The Gnats called *Psenes* do cause Figs to ripen, by taking away their milky moisture, and by bringing in the Sun beams with them: and for that reason in those places where Figs do grow, they are bred in the wilde fig-tree, that from thence being blown with the wind, they may light amongst the fig-trees. By which words of *Pliny* it is manifest that Caprification is nothing else but a certain skill how to cause the Gnats when bred in the green or raw wilde Fig, to fly to the Figs, that they by the wasting of their milky juice and moisture may bring them the sooner to maturity: the which is brought to passe two manner of waies: for either the wilde fig-trees were so disposed round about the Fig-trees, that wind might blow them thence unto them; or else wilde figs being gathered elsewhere, and bound together in a bundle, were cast into the trees; and therefore the little beast like to a Beetle, called in Greek *νεγυβ*, with his noise scaring away the Gnats, and feeding on them if he catch them, the Fig-keepers are wont to chase away and destroy.

The Gnats also seem to be more worthy esteem than the ordinary sort of Almanack-makers; for they will tell you the weather at all times for nothings, and that more certainly and truly, than they which boast themselves born by the *Tripes* of *Apollo*, and a long while brought up at *Cuma*. For if the Gnats near Sun-set do play up and down in open air, they presage heat; if in the shade, warm and milde showres; but if they altogether sting those that passe by them, then expect cold weather and very much rain. When a Gnat comes forth of the Oak-apple about *Michaelmas*, it foretels war and hostility; if a Spider, dearth; if a worm, fertility and fruitfulness. *Mizald*. If any one would finde water either in a hill or valley, let him observe (saith *Panano* in *Geopon*.) the Sun-rising, and where the Gnats whirle round in form of an Obelisk, underneath there is water to be found. Yea if *Apamasaris* deceive us not, dreams of Gnats do foretell news of war or a disease, and that so much the more dangerous as it shall be apprehended to approach the more principal parts of the body.

Upon a certain time there was seen in the air between the Monasteries of *Sion* and *Shene* in *England*, such a pitch'd battel of Gnats, that you could not see the Sun at mid-day. The fight was maintained for four hours, as long as the Armies could stand; at length a mighty slaughter being made on both sides, so many dead carcases of Gnats were found in the hedges and high-waies, that they were feign to sweep the corn fields and meadows with beesm. There followed upon this the banishment of the Monks in both the Monasteries. *Stow*. Whether this be true or no, I leave to those that can resolve such truths; I proceed to that may be of more certainty to be taken notice of.

Of great use are the Gnats unto us, when as the Fish called *Thymallus* (as *Alian* witnesseth) can be taken with no other bait then with Gnats. But as they are sometimes useful and profitable, so are they for the most part very irksome and troublesome, wherefore nature and experience have taught us remedies against them. To which end you may make a Fumigation or Perfume of *Pomegranat Pills*, *Chamæleon*, *Thistle*, *Lupines*, *Wormwood*, *Grist*, *Pine*, *Fleabane*, *Elecampane*, *Cedar*, *Radish*, *Cummin*, *Rue*, *Hemp*, *Dung*, *Galbanum*, *Castoreum*, *Feaver-stone*, *Harts-horn*, *Goats-hoofs*, *Elephants dung*, *Brimstone*, *Sulphur*, and *Vitriol*, which will drive them away.

There are prescribed also these compound receipts: take roots of *Elecampane* 1 dram, *Ammoniacum*, *thymiana*, *storax*, of each 2 drams; burnt shels 2 drams, put all these into the fire and perfume your cloathes. Another; Make powder of *Harts-tongue*, and with *Vitriol* perfume them. Another; Take *Wine-lees* dried, and *Ceruse*, of each alike, with *Copperas* and *Oxe dung*, perfume them. *Aetius*. Another; Take *Vitriol*, wilde *Gith seed*, *Cummin seed*, of each alike, with *Oxe dung*, smoke them. Also the vapour of very strong *Vinegar*, and of *Origanum*, doth chase them away. Another; a *Sponge* dipt in *Vinegar* and burnt in the house drives them away. So *Wormwood*, with *Radish Oyl*, by anointing preserveth from Gnats. *Novus*. *Palladius* adviseth to sprinkle new *Brine* and *Soot* in the chambers of the house. *Rue* dipt in a decoction of *Fleabane*, and laid in the several corners of the house, kills the Gnats. *Ruellius*. If you make a circle of green wet *Hemp* about the bed, Gnats will not trouble you. *Geopon*. If you anoint your self with *Oyl*, or the *Manna* of *Frankincense*, they will presently be gone. The trees that grow in watery

watery gardens, and plants infested with Gnats, are freed from them by burning of *Galbanum* as *Pliny* saith. But a prodigious, that I say not superstitious, remedy seemeth that of *Rhais* to be, I know from what juggling *Democritus* he had it, hang some horse hair and make it fast in the middle of the door, and Gnats will not come in at it. But why should Vinegar kill them, a thing which they naturally desire and thirst after? unlesse it be the vapour of that thing that destroyeth them by taking away their breath (as it often comes to passe) whose substance would nourish them. *Apollonius Tyanens* (as *Tzetzes Chil. 2.* hath left recorded) did so order the matter that no live Gnat could come into the Cities of *Antiochia* and *Bizantium*. But since we do not see how that should be done, the less credit may be given to it.

The Grecians have devised a kinde of tent or covering in manner of a net, of linnen, woollen, or silk; which being hung about their dining rooms and beds, kept the Gnats from entring in. Our Countreymen that live about the Fens have invented a canopy (the first that ever I read of) with less cost, but the same profit, which they call a *Fen-canopy*, being made of a broad, plain, half dry, somewhat hard piece, or many pieces together of Cowes dung, and these they hang at their beds feet: with the smell and juice whereof the Gnats being very much taken and feeding thereon all the night long, let them sleep quietly in their beds without any disturbance or molestation at all, being sufficient reward for their pains so taken. In the day time they are kept off with a fly-flap made of Peacocks feathers or other the like things bound together; unlesse they be very numerous, and small Gnats, for then they will fly into the eyes, ears, nostrils, and mouth also, and taking greater courage to them, sting more sharply, notwithstanding these Remedies.

CHAP. XIV.

Of Butterflies.

THE Butterfly is called of the Greeks, *ψύχ, πάρος, ψάλλυς*, also *οντοδιδυς, περσιδης, περφαλος, οκνυς*; but the more general name is *ψύχ*. The Latines, *Papilio, Ardoynus* calleth it *Campilo*; *Isidore, Avicula*; the Italians, *Farfalla*; the French, *Papillon, Papilion*; the Spaniards, *Mariposa*; the Polonians, *Motill*; the Hungarian, *Lovolddeck*; the Illyrian, *Pupielas, Meteyh, Motyl*; the Germans, *Pisnet, Mulk, Pffscholter, Summerunegel, Zweifalter*; the Flandrians, *Uleghebronsus, Botsershyte*; the Brabanters, *Capelleken, Vlindere, Pellerin, Boter Ulieghe*; the English, *Butterfly*.

The Butterfly is a volatile Insect, having four wings, not two (as *Constantinus Friburgensis* dreamed) six feet, two eyes standing forth of his head, and two lither Cornicles growing forth from before his eyes: the Butterfly hath a two forked beak or bill, and within those forks is couched another little bill or beak, with which they suck in, some the day dew, others the night. They couple sometime with their tails averse, sometimes reflex; and continue long in the act of Copulation. They lay and fasten their Eggs, not little worms (as *Arist.* imagined) on the top and under the leaves, some great, some small, yellow, blew, blackish, white, green, some lesser then Miller seed, some twice as big, others just as big; according to the colour and natural magnitude of each Butterfly. These eggs being laid in a warm place, or being cherished and caused to grow in the day time with the heat of the Suns beams, shoot forth a Palmer or canker-worm, at the first all of one and the same colour with them, but afterwards, as they grow bigger they change their colour. Out of some eggs the Caterpillars appear at four daies end, others do not hatch before fourteen daies, which by little and little get strength and fly, but weakly; yea some of them being kept from the injuries of cold and hard weather, endure all the winter, as experience doth sufficiently confirm in the Silk-worm. After copulation all the Butterflies do not presently die but live in a languishing condition, till winter, and some to the winter solstice; the lesser and weaker sort of them are very short lived; the more strong and hardy continue longer; they appear in the Spring time, out of the Canker-worms, *Aurelia*, growing by the heat of the Sun, and by the temper of the air being instead of a Midwife to them, they are brought forth. The coming of them is for the most part a sign of the Spring coming on; but yet not alwaies, nor in all places. For although they be very weak and not long lived; yet while we were writing, this (saith *Pliny*) it was observed that their issue was thrice destroyed by cold weather coming again: and strange Birds about the 6. of the Kalends of February gave notice of the Springs approach; but a while after with a cruel bitter winter weather that succeeded, they were all destroyed. We ought not to wonder that those foolish *Icarian Astrologers* having no ground for what they say, do tell us that which is false; whereas it doth appear by this, that Nature her self is inconstant; and we being more addicted to second causes than we should; and being unmindful of the first Mover, are deceived by her. *Pennius* reports of two swarms of Butterflies in one Autumn. Now although I do not deny with long and sharp frosts they may all die, yet they are able to endure moderate cold, and do live in warm places even in very cold seasons. For how commonly are they found in houses sleeping all the Winter like Serpents and Bears, in windowes, in chinks and corners? where if the Spider do not chance to light on them, they live till the Spring.

Description.

Copulation.

Arist. saith that they all take their colour from the worm they are bred of: but yet (if this

this be granted) they have other colours besides, as will appear in their particular Descriptions and Histories.

They most abound in the time of Mallows blowing, out of whose flowers when they have thrust in their snout or *proboscis*, they suck a sweet juice with which they refresh their bodies. *Columella* in his Book *de Nat. rerum l. 9. c. 11.* speaketh of the Butterflies thus coupling, and beginning on this manner: *The Butterflies couple after August; after they have coupled the male straight-way dies: out of their dung come forth worms.* But all these things are so horribly strange that they have no shew of truth. For their chief time of coupling is in *May* and *July*: neither doth any Male of them die immediately after copulation; unless it be of that kinde of Butterflies of which those Caterpillars come which are called Silk-worms. To conclude, those things he supposeth to be dung, are indeed eggs: out of which come not worms, but a great many little Cankers, out of whose cases come Butterflies.

Difference of
Butterflies.

There are so many kinds of Butterflies as there are of the Cankerworms: out of whose *Aurelia* they proceed. They differ generally in that some fly abroad, especially by night, these are called *Phalena*. Others only by day, which are called therefore, *hispiones*, or *Day-flies*. The name *Phalaina* is a *Rhodian* and *Cyprian* word; for so they (as *Nicander* the *Scholiast* witnesseth) call that creature which flies to the candle, viz. (*παρὰ τὴν ῥῆν ἀλλήδω*) *Turnebus* out of *Nicolas* and *Lycophron*, will have *φάλην* to be taken for *φάλανα*: of whom, because with the motion and force of its wings it oftentimes puts out the candles, is called *καυδολοβίσκος*, from the roughness, and the bran and meal which seems to be spread upon it, it is called *Λάβη*. And because some of them are so far taken with the love of the light, that they burn themselves with the flame, they are called *Pyrausta*. There are those that interpret this *Phalaina* to be the *Cicindela* or Glow-worm, but not rightly; forasmuch as the Glow-worm never desires the candle at all, but delights generally and chiefly in a dark night. The Germans call it *ein Leight mucken*, *ein Leight flugen*; the Helvetians, *Flatterschen*; the Italians, *Farfalla*, *Paviglione*, and *Poveia*; our North, as also the West countreymen, call it *Saulei*, *e. Psychen*, *Animam*, the soul; because some silly people in old time did fancy that the souls of the dead did fly about in the night seeking light. *Nicander* describes a *Phalaina* thus: which *Hieremias Martius* interprets thus:

Consider what strange beasts rude Memphis breeds;

One like a flying worm, by candle light;

Wherein he plays as if he took delight:

Driven from meats, whereon at night he feeds.

His wings are narrow, of pale hue, not green;

But more like ash-coloured to be seen.

From these things therefore we may gather this description of the *Phalena*, that it is a kinde of Butterfly flying in the night, most desirous of enjoying the light; from whence it takes its name, of a body rough, its wings powdered or sprinkled as it were with a fine kinde of ashes or dust; lying hid all the day time under leaves, or in some obscure place of recess, in the night flying about the candles, and by its too much desire of them reducing it self into ashes: seldome or never it flies but with the wings standing upright on the back, as on the contrary the day Flies keep their wings even with their body. Horns they have for the most part, either rough and large, or very little and short: but the day Flies more long and tuberos in the extremity of them. The *Phalena* come out of the shells of the Canker-worm covered with earth. The day Flies from their *Aurelia*, either hanging upon or sticking unto the boughs of trees. They are for the most part rough, and as it were dusty, flying in the dark, very tender; these on the other side flying in the day-light, are more plain, smooth, even, and have no dust upon them. They fly seldome in the day but toward the close of the evening, lest the dust that is upon them being dried by the heat of the Sun and drowth should shake off, being never used to be wet with rain. But these are not able to fly by night, lest the night dew should wet them quite through, and hinder both their flight and their health: wherefore in rainy weather and all night they shrowd themselves under the leaves, and never fly abroad but in clear and fair weather. The *Phalena* are no lesse affected with the candle than these with the day-light: wherefore these rejoyce at the day-star, that is to say, the Sun; but those at the night-star, to wit, the Moon, and Stars, and candle-light, resembling somewhat the nature, splendor, and glimmering light of the Stars.

The *Phalena* are all either very big or very little. The bigger sort of them have their belly and also the inside of their wings altogether of a sandy colour. The eyes seem blue, the head blackish; between the eyes come out two dusky coloured horns, Eagle coloured, with black crosse lines wreathed like a rope. Upon the shoulders there is a kinde of sandy dusky coloured roll or welt: from whence a black crosse spot is drawn to the end of the shoulders. The body if you look on the backside, is of a bright blue or azure, if on the belly, it is of a sandy colour. The two outmost wings are very large and Eagle-coloured, finely set with spots and white circles, the innermost are far lesse and yellowish, adorned in the inside with certain dusky streaks and spots; it hath thighs brawny and strong, all of a dusky colour, and at the end forked and black. It flies with a great noise, and being blinde in

in the night, what ever glistering there be arising of rotten wood, scales of fish, or the like, it greedily followes. As great Tyrants devour and spoil their subjects, so those night-walking Butterflies batter with their wings and destroy those that fly by day, being by night lodged under leaves.

The second *Phalena* of the first magnitude, as it is somewhat lesse in bulk of body than the former, so it far excels it in the gloss and splendor of colours: as if Nature in adorning of this had spent her whole painters shop; and had intended the former for the King of Butterflies, that is to say, strong, valiant, blackish, freckled: and this for the Queen, delicate, tender, fine, all beset with pearls and precious stones, and priding it self in embroidery and needle-work: her body downy like Geese, something smooth and hairy, like Martens or Sable skins; the head little, great eyes standing out, two cornicles like feathers, of a yellow or boxie colour: she hath four great wings, every one of them having eyes of divers colours, the apple whereof is black, the circle or roundle next to it of various colours, with yellow, flame-like, white, and black coloured circles, and semi-circles. The outer wings from their original to their extremities are whitish, beautified with certain little veins and specks; the edges whereof are adorned with a welt or guard, and a hem of dunnish or dark yellow colour: the inner wings brown or tawny, having one eye apiece as the former, with a three-fold border, the first whereof is plain, the middlemost part going in

and out like a scollop (both of a fiery colour) the outmost of all of a pale white, and as it were sown on by some Skinner or Furrer, she goes upon strong, rough, brawny thighs, of the same colour with the rest of her body. This did *Carolus Clusius* send from *Vienna*, of so elegant and notable figure, that it is easier to wonder at and admire, than with fit expressions to describe.

The third sort hath a great body rough and blackish; each wing hath one eye, the sight or apple whereof is black, the roundle brown, the half circle white. There are divers pieces in the wings of a watry *Amethyst* colour, the edges of the wings at the first sight appear ash-colour, afterwards Eagle-colour. The head very short and little, putteth forth on either side a black eye, the apple whereof is of a notable whiteness, between those break forth two very small short horns of a dunnish colour. It is begotten of a rough Canker-worm, not a smooth.

The fourth hath a great dark coloured head, out of which arise two straight cornicles somewhat black, the neck is adorned with vermilion specks, the breast rough, square, dusky, the shoulders coal black, the belly of *Amethyst* or purple colour, divided with five or six circles or rounds; the feet black as pitch, the wings of a light brown, full of long black little veins.

The fifth hath a white head, black eyes, the horns a little yellow, the outmost wings long, of a sad colour between white and brown, the innermost being lightly and as it were by the by coloured reddish, the shoulders very black, the rest of the body somewhat of a rose colour, bound about with seven black circles, a white line running all along the middle of the belly.

The sixth hath head and shoulders rough, and the utmost wings drawn with bloud colour lines, are a white brown; the eyes of the head standing out, of a violet or a zure colour; the inner wings somewhat of a carnation, represent the eye in the middle part, shining with the apple crow black, the circle about it purple; the body like dried flesh, and a little smoak't, divided with six roundles black and brown.

The seventh hath the outer wings white, with certain brown spots here and there as if it were watered Chamblet; the neck ring'd about as it were with a red skin reaching all down the shoulders like a Fryers cowle; the head is red, the eyes pearl colour, the horns flame colour; the innermost wings of a shining red speckled black; the feet red, the belly all of the same colour, with seven incisures or cliffs of a deep red lead colour.

The eighth is almost all over brown, but the edges of the wings and the middle part of the horns are of yellow or box colour.

The ninth is almost like unto it, but that the edges of the wings are like black sand, it hath horns broad and bended, of a whity-brown colour, the middle of the outermost wings stopped with a round white spot.

The tenth is of a like bignesse, all over of a white brown, but that the middle of the outermost wings is marked with a white spot, and the eye with a very black apple.

The head of the eleventh is tuberous, the horns slender, the body like clay trodden; otherwise the wings are all of a dark silver colour.

The twelfth somewhat of an ash-colour, the wings spotted black, the eyes black, the apple white.

The thirteenth hath very little or no horns at all, the body all over yellow, except the eyes (which are little and black) and the wings which are whitish.

The fourteenth appears of colour various, it hath black tuberos horns; as also the eyes and feet; the shoulders are drest with five white plumes as it were, of which the two middlemost have three black specks; the wings snow white, bespeckled here and there with black, yellow and blew specks; the body russet, articulate or jointed, the sides whitish, she puts her tail in or out as she pleareth, it is sharp, yellowish, jointed; all the body as it were sprinkled with dust; otherwise in regard of the tuberos cornicles it had come in the number of the day Butterflies. It layeth abundance of yellowish eggs, in the laying whereof she puts forth a little tail, which she puls in again at pleasure.

The fifteenth hath two black slender cornicles, the head and shoulders hairy, of a dun colour, the neck adorned with a collar of Vermilion, the shanks reddish; the outmost wings chamoletted with white and dun, the innermost are exactly red spotted with black spots; the body of a light vermilion, rounded about with six black guards, or welts.

The sixteenth seems to be very rare: if you look upon it as it lies on its back, it seems to be all over of a murrey colour; if as it lies, green and yellow; it hath five very red lines or streaks drawn along the shoulders; as also seven spots set quite through the middle of the back, do adorn the rest of the body: the wings also traverse with murrey spots or shadows rather, the beginning whereof from the head to the bottom of the breast is terminated with a line of whitish or silver colour.

The seventeenth, when it goes upon its feet and its wings close to its body, looketh dun; but when it flieth with the wings stretcht forth, the innermost wings are carnation set about the edges, with a blackish list or border: it hath very long cornicles, and the promuscis or snout doubled in or rolled up together: the gray shoulders are marked with round sand colour spots; the side also, and all the joynts of the body are set and edged about with hoary hairs.

The eighteenth being very rare indeed, was sent me by *Clusius*. The horns whereof pike colour, the head black as pitch, the nose crooked, the circle of the eye white, the neck scarlet or crimson; the shoulders being rough or hairy, are covered as it were with a sable mantle; the outer wings decked with a white and black hem; the innermost red speckled here and there with black spots; the body black, as likewise the feet; but the sides of the body are set out on each side with seven bloud-colour spots.

Like unto this there was another sent, but with the cornicles altogether crow colour; and on the middle of the shoulders dressed with a pure white list, as it were with a string of pearl.

Of all these the bodies seem to be of a great bignesse.

Now we shall addresse our discourse to the middle sort of *Phalena*.

The first of which is white all over, but only that the outer wings are bedawbed with certain black spots & freckles; and the innermost with very red specks and pimples white in the midt; the eyes very black, the feet and horns yellowish; in stead of a nose there comes forth a rough

hair or bristle, the which is wound round up together like a roll.

The second, the whole body rough or hairy, and of a light red; and so are the outer wings, were it not for whitish spots, and hems that go about, and yellow little eyes in them; the cornicles being yellow, are marked with black spots; the inner wings are of the colour of the marygold, but adorned with eyes and hems like the former.

The third hath four white wings; the outer wings overcast with little blew veins here and there plentifully, and two round blackish spots in the middle; the line that is about the wings is yellow, and the cornicles of the same; the head and body black, the eyes exceeding white, the sides of the shoulders are marked with four very white oblique lines on each side.

The fourth hath broad horns of crane colour, the body black, the sides gray, the wings yellowish, all over besprinkled with black spots like dragons, broad at the top, and afterwards round; the edge of the wings like the Bars snagg'd, and as it were prickly, all over black, within six white specks; pearls being placed on each side do set it out.

The fifth is all over black, but that it hath pale reddish spots upon the wings.

The sixth hath the body and the cornicles black, the eyes white; the wings are black underneath, above trimmed with golden hairs & spots; to which are joyned black studs, run through with a silver coloured thread: the outmost wings have a black border winding in and out, with gold laid underneath, and as it were wrought in and out with a needle.

The seventh broad horned, the black body waxing hoary; I know not whether I may count it for a discredit or a grace to it. The beginning of the wings are red, the rest yellowish, but each part embossed with black square spots and a golden thread running along the edges.

The eighth hath four cornicles spreading wide, of ash-colour, two of them very long and larger in the borders; the body like the former, the wings of a pale ash-colour, chequered with black, and painted every where about the edges with drops of the same colour.

The ninth, the head, eyes, cornicles, body, and innermost wings do represent the golden ochre; the shoulders and outmost wings are black, but only for a black border, having on each side of it an ash-colour line.

The tenth hath its body yellow, bedropt with black from the neck to the tail, both back and sides; the eyes, cornicles, and feet perfect black, the outermost wings white, but garnisht with borders of yellow, black small studs, and spots likewise.

The eleventh if you look on the wings, it is snow or milk white, but only that it is all to bespeckled with little black spots; the shoulders also are white and downy; the body and back yellow, and jointed, having eight little black spots; the eyes big and standing out of the head, between which sprout out two black and hairy cornicles. In the night time she flies about the meadows and pastures.

The twelfth hath its wings so long that it can scarce fly; it hath very short cornicles, little very black small eyes, all the body else is white, being here and there sprinkled with certain yellow veins and hairs.

The thirteenth (except its black eyes) is of a Crane-colour, somewhat blackish; the cornicles more than ordinary long, the body rough and hairy, the wings of the same colour with the body, but about the edges glistering with a greenish, glassie varnish.

The fourteenth is a very rare one, though all over almost of a sand-colour; it hath cornicles for the bignesse of the body, strong, black, and crooked like the ox, the eyes great and black, the head short, the neck thick; the outermost wings adorned with certain black studs; the ridge of the back is dressed up as it were with five black heads of Gilliflowers, three forked.

The fifteenth hath its wings of a pale ash-colour all over, amongst all the rest it is destitute of cornicles, the eyes are somewhat black; the back yellowish and set with five dusky coloured spots.

The sixteenth seemeth to be of the same colour, but that it is streaked with black athwart the outermost wings: but this is every where of one colour (except the eyes which are black). It hath a long body, joynted, four long narrow wings, six feet, those behinde are twice as long as those before, it hath slender cornicles but growing out very far.

17. This comes of the Caterpillar of a Silk-worm, white all over but the eyes, which are blackish, and certain small yellowish veins running straight over the wings, and crosse the joynts of the body: I call it the Silk-worm *Phalena*. Of which more in the story of the Silk-worms.

The least sort of *Phalena*.

1. In the Classis of the least sort of all, we shall place one and the first very admirable, going on four very black feet; it hath the outer wings azure, the innermost yellow, and the innermost (which is not usual) lesse then the outermost; the yellow body also is so big, that the wings can scarce cover it; the cornicles are full of little points, and the eyes all but the fight blackish; the head and the snout (being long, slender, and rolled up together) are somewhat yellow.

2. The second appears blue and green, it hath a little body, the feet and cornicles blackish.

3. The third hath the shoulders and wings greenish, of the colour of leek blades; the body dunnish; the outmost wings are guarded with a guard set with white and dun spots; it hath a very little head, the feet and the cornicles ash-colour.

Moreover there are found in houses a certain sort of little silver coloured *Phalens*, marked with black spots, which fly to the candles, called *Moths* in English, which eat linnen and woollen clothes, and lay eggs, of which come *Moths*, and of the *Moths* again these *Phalens*; they are said to come first of all from rose leaves and other herbs putrefying.

Three others I have observed in pastures and meadows. The first whereof hath the outer wings black, each of them marked with 5 red spots like bloud, the innermost wings are all over red, the body dun, the head, short cornicles, and the feet blackish. The second is all alike, only that it hath but four red spots in the outmost wings, and hath a more slender body. The third is almost of the like shape too, but the cornicles are a great deal longer, and the red spots scattered after another manner; for there appear about the edges of the wings only two red bloud-like spots; but from the rising of the wings two spots drawn at length. And thus much may suffice to be spoken of the night Butterflies, or *Phalens*; passe we on now to the day Butterflies.

The Day Butterflies are to be described after such a sort, that all men may see the fruitfulness and elegancy of Nature in this behalf and admire. For she hath not lette played her part, or wrought hard rather in the variety of these, their colours, attire, rich apparel, roundles, knots, studs, borders, squares, fringes, decking, painting, making them, then she had done in the *Phalens*.

1. The first Day-Butterfly being the greatest of all, for the most part all yellowish, those places and parts excepted which are here blacked with inke. Moreover, the roundles of the inner wings are sky-colour, insomuch that you would think they were set with Saphire stones; the eyes are like the Chrysolite: the bignesse and form is so exactly set forth in the figure, that there needs no more to be said of it.

2. The second differs very little from the first but in bignesse; it hath nevertheless, very black eyes & longer cornicles, where you see the color white, there suppose it yellow, except it be those great eyes at the end of the innermost wings, the apple whereof must be made flame-colour, but the semicircle bloud-red.

3. The third not much unlike in colour, but that the extuberances, and the outmost border of the innermost wings is sky or woad-colour; as also those three taches which you see painted under the hollow part of them.

4. The fourth may be said to be the Queen or chief of all, for in the uttermost part of the wings, as it were four Adamants glistering in a bezil of Hyacinth, do shew wonderful rich, yea almost dazzle the Hyacinth and Adamant themselves; for they shine curiously like stars, and do cast about them sparks of the colour of the Rainbow; by these marks it is so known, that it would be needless to describe the rest of the body though painted with variety of colours.

5. The head, feet, cornicles are of bloud-red, but the eyes purple, the back black and blue, the belly yellowish, the wings at the basis of a bright yellow, and afterwards more sad; the utmost parts of them being rusty colour, and waxing blackish with an unpleasing duskiness, are beautified with three little yellow spots; to the innermost being sprinkled with rusty colour, first two yellow, afterwards three pale yellow spots do stick. If you consider them with the face upwards, the upper wings are of a greenish yellow, marked with six or eight spots, the innermost of a light grass-green, stained with two white spots; the belly and face yellowish; it comes out of a whitish *Aurelia*, spotted with little dark coloured spots.

6. The upper wings without are blackish, with a certain gard of a decayed red running through the midst; the extremities of them glister with white spots and specks like drops, being sharpened with dark coloured notches round about; but in the inside that guard doth shew of a more clear and full colour, and toward the bottome they seem blue; the undermost wings appear of one colour without, of another within, without they are all over sad coloured, except a reddish border, with a prickly purple very small and blackish, marked with four little points, and two diverse coloured opals placed together; within they

they shew nothing like to this, but from a black and purple embroidery, they end in a sad fading red, the body is black, the eyes, horns, feet, all dusky and of the same colour.

7. The whole body is black, yet in every incision of the back, it hath two white spots; & wings between yellow and red, adorned

with black and very white specks: but the bountiful Mother of all things, Dame Nature, hath chiefly beautified the borders of the wings, which have little teeth set like to saws at an equal distance one from the other, in the border whereof 20 blue studs pierced through with black lines, make a glorious shew.

8. Nature bred this with a chamblet mingled coloured coat, but it wants lively colours, for the wings are of a black reddish fading yellow and russet colours, and it is more beautiful for its soft skin, than for its gallant apparel.

9. This is for the most part of an ash-colour, but if you look on the inside of the inmost wings, there is nothing that can better represent the wings of a Turkey-cock; for the feathers that he flies withall, are covered by other feathers with scales; the eyes are black, as the horns are also, which are swollen like water-cats-tails.

10. The body is black, the shoulders are covered with yellow down, as is also the whole head; the horns are yellow also toward the head, which appears the sadder by a spot of a dark red; many round pearls set at just distances, do make the outward skirt of all the wings to be more graceful: but within side they are fouled with very black spots like lintels. But as the part is less comely outwardly, so the inward part of the inmost wings, shining with a whitish green, with silver spots upon it, shines gallantly: and those spots that seemed outwardly round pearls, seem inwardly pure refined silver.

11. It holds forth a rare list of oriental Pearls shining in blue, the upper wings being of a flaming yellow, shew like fire painted with six most black guards, the root of the inmost is black, then they shine from yellow to a fiery colour; the body is downy with darkish hairs, and the horns and feet are of the same colour.

12. It is wonderful beautiful, the wings are light blond-colour, dipt with black spots, they shine with smal long beams disperfedly drawn like threds to the very outmost of the coat, and this is adorned within with golden crooked lines like the Moon, being it self a murry, nicked on the sides like a Saw: the body is purple coloured from black, the eyes shine like gold, the feet and horns are black.

13. The body and wings appear black, upon the black wings, jagged in the circumference, first hairs grow, then borders, and lastly golden studs: also the small eyes in the black head are tintured with gold, but the horns grow forth with spots white and black, and end with a small very black knob.

14. It much delighteth in the curiosity of the decking of it; the body is rough and blackish from white, a black eye, and a white pupilla, about the bald eye you shall see a circle almost white as snow, the horns are the same with the former, the outward face of the greater wing is known by the flaming colour, golden lines being drawn upon it, with four dinted skirts; about the end of it three round pence set triangular, do adorn it. But the inward face of it seems most pleasant, with divers golden scales and studs put like a coat of mail, and tyles of a house: also a golden line beaurifies the utmost part of the wings. It represents a Peacock very much by its wings, and as that is, so hath it a proud and gallant body; the feet and legs are somewhat black, (lest it should be proud of its feature) the snout is like a spiral line made up like a Maze.

15. This hath also a hairy beak wreathed up like a vine rendrel; it is inwardly ash-coloured, and outwardly a faint gray, the wings are prickly, jagged like bats wings, some dun lines do outwardly part these, inwardly six black studs do much set them forth.

The outward wings of all are a dark green in sight, which some spots and pieces of white and yellow do beaurifie; the inward are perfectly red, being sprinkled with ten most black spots: the belly shines with eight yellow scales; the back is red inclining to yellow, and the tip of the tail is a light blue. The rough shoulders are commended by a yellow Moon drawn downwards, a white silver coloured apple makes the red eyes more sharp.

1. The eyes seem yellowish, the horns a decayed russet, the wings and all the rest of the body are a pale yellow; the inward wings are marked outwardly with one only full yellow spot, but inwardly they are tintured with a certain black spot upon a watry green; the back is blackish from a blew, the belly is yellowish, it proceeds from an *Aurelia* coloured with gold.

2. The second is not so pleasing a colour, the inward wings from a fading blew, decline to a Crane colour, and end as it were into a lead-colour, the outward wings are blacker, noted here and there with dark spots, and the body seems to be the same, it flies rudely with dented wings, and retched in the borders, and as it were prickly, and like a mourner of that kinde, it never comes forth but in mourning apparell.

3. We have painted out this, as it were stiffe and raising it self with the wings lifted up, it hath also prickly dents, but the outward wing from a pale yellow is marked with the black pieces; but the next part of the inward wing from the root is dark black, the middle part is pale, the last part is whitish, chequered with right and thwart fibres; the body appears dusky, the eye is black as pitch, the horns are black.

4. This is distinguished two waies; for when she opens either wing to ballance her body, the body shewes black, and four dark wings fastned to it ridged as it were with a black pencil, and ending in a shining rusty colour; but when it sits on flowers and lifts up the wings, the first wing is yellowish, adorned with a comely round spot like a target, the colour whereof is pale, the boss of it black, the outward circle citron coloured; the belly, and breast, and the whole face are white; the black horns incline toward a yellow.

5. It seems inside and outside all alike; the head and wings look pale; the body is wan, as also the horns; the eyes are flaming red, the shoulders are hairy with a pale down.

When it stretcheth its wings towards you, it appears a shining sandy colour, like herb dragon, with black spots: the body also if you see the back, seems a watry black, the belly somewhat more dark; they eye is black, clear with a white or whitish apple; the horns are black as a crow, the wings from you are of an unpleasant brown, and of a decayed Weefil-colour.

7. The

7. The jagged wings represent a fire-stone, shining with bristle coloured little veins, and the skirt also being sprinkled with black spots; the whole body is of a shining black but that white points divide the horns, and in the black forehead golden eyes twinkle after a sort.

8. This hath the same kinde of body, but the horns are reddish from yellow, the wings appear changeable, marked with divers pleats, ridges, borders, skirts, of many colours: all these colours are sad and dull to the eye, they want all clearness and varnish, and are pleasant only in their mixture, placing, and number; in some places they represent a smoky flame, elsewhere an unpleasing dark colour, and a fading red; and the rubies included in the last border in white semi-circles are nothing lively.

9. The outward wings are spotted with dirty muddy spots, about the last part they are adorned with a black target, the middle whereof is set forth with an ivory point: the inward wings have four such targets, but augmented with a yellow circle besides; the two middlemost are of a fit magnitude, the two outmost are very small; the body of this creature is a whitish dark, the eyes that stick out are black: but if you look upon the inward part of the inmost wing, they look smoky, and they are very beautiful, with six gilded leaves curiously disposed.

10. The head is a pure white, but some dusky and black spots adorn the milky wings, the back and sides are red from yellow, 9 or 10 black spots put under the cuts do adorn them.

11. In proportion, and almost in colour and form of the body it represents the Eagle amongst birds of prey. It hath narrower wings than other Butterflies, it hath as it were a broad feathery tail, the inward wings are not warry coloured, like the rest of the body, but red from yellow, or of a flame colour; it hath a crooked nose like the Eagle, a belly hoary, the horns are great and strong, of the same colour with the uppermost wings; the eyes are pretty well prominent, black, with a pupill white as snow.

12. This hath the same form, it only differs in colour. The body is ash-colour, the tail is black, and the back is something silver coloured; the wings are long and blackish, and polluted with little black spots, the inward wings appear dusky dark coloured; both these kinds of Butterflies are wonderful swift, and dare for flight to contend with the Eagle.

13. This

13. This is the swiftest of all, and hath shoulders seeming of a yellow moss colour; the wings are white as milk, in the extremities of them they are marked with five or six dusky feathers, the middle of the yellowish back is adorned with a cole black spot, of both sides two downy extuberances are thrust forth, the rump is compassed about with a certain black down, it will fly as fast as any Swallow, and indeed is swifter than any Bird.

We have seen but eight of the smaller kinde.

1. The first parts of the inner wings are of a full bright shining scarlet colour, and delicate red, but the outward wings represent a light purple, mingled of black and red, and drawn over with some snow white spots, the rest of the body is black, even the branched horns also.

The smaller Day-Butterflies.

2. This is silver colour at the roots of the wings, which afterwards are purple coloured from blue; the uppermost wings are graced inwardly with two black white studs; the body is full of dusky spots; it hath six purple feet, three put forth on each side; it hath a crooked bill; out of the head four small horns break forth, besides the two long ones.

3. If you should see this fly, you would say that the wings are of a decayed purple colour passing to a lively blue, and all plighted severally, but inwardly there are round eyes, they seem more gray and cankered; the head is blue from green, the body is deckt with dusky and white faces; the eyes seem very black, and the apples of them very white:

4. It comes in a pleasant habit, with wings set with eyes, that are of a most heavenly incomparable blew. The most perfect artificer Nature it self made it all eyes; that you would say directly, that *Argus* eyes were not set into the Peacocks tail, but into the wings of this Butterfly, which she doth stretch out against the Sun with no lesse pride than the Peacock doth, and (by the heavenly colour which she excels in) she is almost able to shame the Peacock.

5. The body is of a Crane colour, the upper wings are green in a white stalk; in the middle they are yellow and ash-colour, the inferior wings are at the root of a dark green, otherwise whole, but inwardly they are sprinkled often with spots of an unpleasant green; the eyes are black, as are the heads of their horns.

6. It hath round bunched smooth shoulders, which are of the colour of ashes mingled with ink, the body is full of cuts, and is of an ash kinde of colour; it hath narrow wings, and the utmost are of a Crane colour shining with some exceeding bloud red drops, the little head, the feet, the horns are like the body in colour.

O o o o

7. You

7. You would say, that this is kin to that is bred of *Gimny* pepper, and setting aside that it is lesse and more black in body, and the silver colour of his upper wings, it hardly differs from that.

8. All the wings are faint clay colour, or rather shining with a pale yellow, with some brown spots, and others that represent old cankered colours, the little eyes are black as a raven, otherwise it is all yellow.

9. All the wings are painted with white and gray like sea shell-fish, the borders are rounded, and deckt with white lines running through the middle with indentures.

10. This hath wings like Perwinkle shells, set with studs, it is mingled colour of a white and obscurered, and doth set forth to us the unspeakable power of God in the diversity of its colours.

Of the use of Butterflies.

He that beholds the forms, clothing, elegancy, and rich habits of the Butterflies, how can he choose but admire the bountiful God, who is the Author and giver of so rich treasure? wherefore art thou proud in decking thy self, and takest so much delight in thy own beauty? possess thy temporary fading goods without envie, for know that there is no Butterfly but is as beautiful and pleasing, and for the length of their life they have a more constant comeliness than thou hast: thou hast it may be an incredible agility of body, and numbleness in running, but yet O man if thou shouldst exceed all men, thou canst not equall a Butterfly. But you will reply that your cloathing is incomparable, and that you can boast of the *Persian* and *Tyrian* silk, of the best purple dyes, brought unto you by shipping: truly should you but see the rich robes of any Butterfly, besides their purple dyes, and the rows of pearls, and the borders set with diamonds, rubies, the pyropus, opals, emrods; if you did but see and consider seriously the elaborate composition of their futures and joynts and the imbroidered work here and there, of fine divers coloured twine silk set with studs and eyes of gold and silver, thou wouldst let fall thy painted tail like the Peacock, and casting thy eyes down to the ground from whence thou wert made, thou wouldst learn to be more wise. It may be thou wert born at first in a house of clay and mud walls, or else in a palace built of polished stones; but some Butterflies are born in their houses that are the *Aurelia* like to pure gold, and exceed *Attalus* for the excellency of their birth, and delicacy of their apparel. Learn therefore O mortal Man, who ever thou art, that God that is best and greatest of all, made the butterfly to pull down thy pride, and by the shortness of their life (which is of no great continuance) be thou mindful of thy own failing condition. Wert thou as strong as *Milo* or *Hercules*, and wert fenced or guarded about with an host of Giants for force and valour; remember that such an Army was put to the worst by an army of Butterflies flying in Troops in the air, in the year 1104. and they hid the light of the Sun like a cloud. *Licosthenes* relates, that on the third day of *August*, 1543. that no heath was left by reason of their multitudes, and they had devoured all the sweet dew and natural moisture, and they had burn'd up the very grasse that was consumed with their dry dung. Also in the year 1553. as *Steidanus* reports, a little before the death of *Mauritius*, the

the Duke of Saxony, an infinite Army of Butterflies flew through great part of Germany, and did infect the grass, herbs, trees, houses and garments of men with bloody drops, as though it had rained blood. But it may be thou art in love with some female beauty, and desirest to please her; O fool, remember the fate of the *Phalena* Butterfly, which being invited by the light of the candle, as by a fair beauty, is consumed by the flame it fell in love withall: and rejoicing like the *Pyrausta* bred in the fire, removing but a little from it is presently dead. And thou great Astrologer, who makest *Aries* to be the forerunner of the Spring, rather adore the Butterfly that is a certain messenger of the Spring, and a more sure prophet than your horned Ram. Would you allure fish to your hook, and catch them? hear what gallant baits are made, as we finde it in the *Tarentine Geopon*. Take 1 ounce of the venomous dung of Butterflies, Anniseed, Goats-milk cheese, Hogs blood, Galbanum, of each half an ounce, Opopanax 2 drams, beat them all diligently, and powring on good sharp Wine, make Troches, dry them in the Sun and keep them for your use. Castrels, and almost all birds of prey are freed from consumptions by feeding on Butterflies, and grow very fat thereby. *Nicolaus* in a composition of some powder, makes mention of burnt Butterflies; by which words *Turnebus* understands Butterflies that fly to the candles: they cause urine exceedingly, as almost all Insects do, but with less danger: moreover, since they feed on dew alone, as do snails, and abhor to meddle with sharp corroding or stinking things, or such as have any venomous or malignant quality in them; truly the Colledge of Physicians are too wayward that dare prescribe a Spanish fly inwardly, yet never made an essay to know what force there is in Butterflies. *Plinius* saith wisely; *That our greatest knowledge is very small compared to that we are ignorant of*: for some small creatures upon the earth are despised, whose force, if we did know it, we should praise to the skies. You therefore sons of *Aesculapius*, search out the vertues of Butterflies to be used inwardly and outwardly, for the health of the body; for had Butterflies been useless, surely God would never have set them forth, bestowing so great liberality upon them. But since they are not only for a remedy for us, but may do us much hurt, being inwardly taken in too great a quantity, as being poyson; I shall shew how that may be prevented, and driven off, if *Ardoyus* deceive me not. *Phalena* or night Butterflies, such as fly at candles at night, it may be were accounted of ancient time amongst dangerous medicaments, for the same reason that Toads, Bats, Owls, Howlets and Gnats were; for they held that all living creatures that labour in the day were safe to be used; but night-workers most unhappy and accursed. *Pliny* commends a Goats liver to drive them away, yet he shews not the means to use it. But if night Mothes go into a Bee-hive and trouble Bees in the night, bury dung mingled with the marrow of an Oxe, and by the smell thereof these unquiet disturbers will presently fall down. *Columella*. *Palladius*, in April, (for then they commonly do most hurt) places a brais vessel between the hives, that is high and narrow, and puts a lighted candle in the bottom of it, and they will come in there for love of the light, and there they are half burnt, or choaked by the smoak in the narrow vessel. Bitter vetches are held amongst edible herbs, to prevail most against Butterflies; others drive them away with smoak of Gith and Hemlock, as *Rhasis*: others hang a horse tail pulled off, upon the door, and they wittily believe that Moths are kept away thereby. Thus much I had to say of the divers use of Butterflies; who though some despise them, yet are they of great use and admirable.

CHAP. XV.

Of the Glow-worm.

THE Greeks have many names for this Insect, for from the shining of the shanks and tail, it is called *λαμπρίς*, *πυρλαμπρίς*, *κυσλαμπρίς*. *Suidas* calleth it *πυρλαμπρίς*; *Aristotle* *βόρυκος*; *Hesychius*, *πυρρολαμπρίς*: it is also by way of metaphor perhaps called from the Latine word *Scintilla*, a spark, *λαμπιδος*, & *πυρρός*. The same Author calleth the male of it *αἰθαῖς*, because it is *καυοῦ* *πυρρός*, but the female cannot be so called: some improperly call it *φάλανα*, for it is one thing to cover the light, another to carry light with it. Those which *Aristophanes* calls *μύμνις*, some interpret *Cicindelas* or Glow-worms, but upon what ground let them judge.

The Latines call it *Cicindela*, *Nocticula*, *Nitedula*, *Lucio*, *Lucula*, *Luciola*, *Flamis*, *Venus*, *Lucernuta*, *Incendula*, as appears out of *Cicero*, *Pliny*, *Scopas*, *Agricola*, *Varro*, *Festus*, *Plantus*, *Scaliger*, *Turnebus*, *Albertus*, and *Silvaticus*. In Arabick they are called *Allachatichi*, that is to say, birds flying by night: in French *Ver luisant*, *Mouch claire*; of the Germans some call it *Zinduerel*, others *Liegth mugk*, i.e. a shining fly, and *Zindwurmle*, speaking of the male. For in some places of Germany the male Glow-worm, that is that which flies, doth not shine at all, but only the female called *Grass-wurm*, *Gugle*, and *Feurcaeser*. About *Frankfurt* on the *Main*, from the time in which they do most frequently appear they are called *St. Johannis Kaeser*, and *St. Johannis Fliegen*. In Brabant *Ein light of nacht mugge*. In Italian *Luciola*, *Lucio*, *Farfalla*, although they grant this to be the name of other sorts of flies that come about the candles. In *Vincentia*, *Bissola fuogola*, i.e. a fiery worm: in *Cremona*, *Lucervola*; *Lombardy*, *Luiferola*; in *Spain*, *Luriergana*, and *Lutierrega*; *Polonia*, *Zknotnike*, *Chazazekik*, *Wnocy*, *Szwiecacy*; in *Hungary*, *Eyel twndoecklo*, *bodoratska*.

vilantso. In English, *Glow-worm*, *Shine-worm*, *Glass-worm* i. e. a glistering or shining worm. For here, as also in *Gasconia*, the male or flying *Glow-worm* shines not; but the females which are meer worms. On the other side in *Italy*, and in the County of *Heidelberg*, the females shine not at all, and the males do. I leave the reason to be discussed by Philosophers.

Their description.

Now the male *Glow-worms* have wings, the female are without; and that is in *Europe* it self. The male *Glow-worm* of *Europe*, is a little creature flying, having four wings, the outermost whereof are like leather, the innermost membranous, of a silver colour, transparent. The body is long, a little squat and flat, having five incisures or clifts: whereby it may be extended or contracted as occasion serves; the body at length seems to be longer than the wings, when contracted, shorter; the head broad, dunnish, flat like a hood; out of the forehead come two cornicles as out of one centre, near which the forepart of the head doth a little extuberate: not far off from the roots of the cornicles on each side rise little round swellings, shining like jet, which are instead of eyes, the head joined to a very short neck and body, of a blackish dun colour, it hath six feet in the breast near unto the head, the hinder of which together with the flanks are of a yellowish colour, the rest of the feet blackish, it is slow, and creeps as it were with a grave pace; the breast buncheth forth a little, the body between the incisures or clifts whitish, at the tail it hath two spots, on each side one like a Moon, in clearing out of which cometh that shining brightness in the night, like burning brimstone, as if it did sparkle in the air: this never is seen in *England*, or if it do live here, it shines not at all.

The female *Glow-worm* is a slow paced creature without wings, the breadth of two fingers in length (although in *Gasconia* *Joseph Scaliger* saw far greater and longer, those which they call *Luttarba*) of the bigness of the mean *Canker-worm*, to which it is not much unlike: the head small, flat, hard, black, long, and sharp toward the mouth; out of the end of which come forth two short black cornicles; it hath six feet, small, black, with three joynts, near the head like the *Canker-worm*; the body long, somewhat thick, and flat like a fillet, having twelve deep incisures, besides the neck which it puts out or in as it pleaseth, the parts between are like black plates heaved up when they go. All along the back there goes a very small whitish stroke from the head to the tail: the sides of the belly are of a bright, murrey colour, the belly and tail toward the end whitish, but the rump it self is black, by the benefit of which she lifts up her self and creeps, and by certain little forks that come out of the same, she hangs upon any thing; under this part she voideth from her belly a clammy and flaky excrement like honey, which being brought back to her mouth, she takes in again, and then going backwards she seems to draw out clammy threads, the which she devours the second time, and so by receiving in and calling forth she sustains her self. Those parts that are white do glitter in the dark with a wonderful splendor, representing terrestrial stars: insomuch that they may seem to contend with candle or moon light. This is worthy observation, that that so bright lustre expires with the life; where then is that perpetual light which some foolish naturalists so foolishly and impudently prate of? some of them I have seen sometimes with wings, and sometimes in the fields, flying up and down in the streets and wals of the Cities.

At *Vincentia* in *Italy*, they say there are those somewhat bigger than ours; all over black; else they differ not at all.

They feed upon herbs, they continue long in copulation, as *Julius Scaliger* (a great Philosopher of our times, not behinde any of the Ancients) hath diligently observed; whose words are these: *Cicindela volantem in coitu deprehendi, &c.* I lighted upon (saith he) the *Cicindele* or *Glow-worm* flying with her male in the act of copulation; the male being touched did not refrain, they were put into a box with holes in it all night, the next day the male stuck close; at noon the male let go and died. After which time, about the evening many eggs were laid by the female, which within the space of twenty hours went away alive. This story *William Brewer* an Englishman, a learned man and my good friend affirms for truth, being an eye-witness thereof, seeing them once in the act of generation. They are long in the act, and so bring forth many insects, this the Philosopher confirms speaking of Insects thus in his 1. Book de gen. cap. ult. συμπλέκει γὰρ πολὺν χρόνον, *Shee tarries long in copulation, but afterwards brings forth speedily*: I could wish *Scaliger* had took notice what creatures came from those eggs, for so the story had been more perspicuous. Though yet according to the course of nature it be easie to judge. For what could come out of them, but those small *Erucæ*, black, thick, and rough, of which *Arist. hist.* 5. 19. saith those *Glow-worms* without wings are generated. Of these then come the unwinged *Glow-worms*, and of them with some alteration the flying *Glow-worms* called *Bostruchoi*. From whence it is to be noted, that either *Aristotles* copy is faulty, or that the interpreters have committed two errors; they have altogether left out the word *μελαίνων* (which makes so much for the clearing of the story). Secondly, out of those being changed they say come those (which *Gaza* translated) *Cirros*, altogether against the minde of the Philosopher, if the Greek copy be not corrupted. For so runs the Greek, *Ἐκ δὲ μελαίνων τῶν αὐτῶν ἔστι δασύων, &c.* Out of certain black rough small worms cometh the *Cicindele* without wings; out of which in the second place being altered into a *Chrysalis* cometh the flying *Glow-worm*; and out of them in the third place those which are called *Bostruchoi*. But what

Insects

Insects those should be which of the Greeks are so called *βίσπυγες*, is not yet known, I believe there is not much difference between them and the former. *Ephesius* a Greek Author a Commentator on *Aristotle*, saith that the *Bostruchoi* are generated of the Glow-worm, and are called by the countrey people *Cicca* or *Plata*; as *Niphus* translates *Ricini*, i. e. *Tykes*. Therefore in the judgement of *Ephesius*, that *Bostruchoi* or *Ricini* take their original from the winged *Cicindele* with some alteration. But of the *Ricini* or *Tykes* in their place. *Calius* l. 9. *Antiq. lect.* c. 4. *Cirrhum inquit dicerem, &c.* I had rather call the *Cirrhus* such a worm as that is, which according to *Dioscorides*, is of colour between black and white; but what that worm is, neither he nor any man else doth tell us.

I wonder at *Cardane*, who will have this *Cicindele* to come of the *Crabrones*, ascribing their splendor to the polishing of the outward skin. *Ex Eruca in Crabrones, &c.* From *Eruca* they become *Crabrones*, or which is more likely, from *Crabrones* they become *Erucae*. Forasmuch as the Caterpillars called *Erucae* are bigger than the *Crabrones* or Beetles, and do shine more dimly, as it were spent with age, and then is it probable that when she ceaseth to fly, she layeth eggs. Here *Cardane* confounds all. For of the *Crabrones* come the Glow-worms, not of them the *Crabrones*. Besides it is not the smoothness of the skin that makes them shine, as he overhastily concludes, neither do the wings cause it, which of all the rest of the parts are most sleek: what *Cardan* means by his last words, I cannot tell. But of all the rest *Baptista Porta* and *Hesychius* were grossly mistaken, who ascribe their original to the dew or tow.

They appear from the middle of June to the middle almost of September. Which *Pliny* expresseth in these words: For before forrage is ripe, or after it is gone, they are to be seen: and elsewhere, when Glow-worms appear, it is a common sign of the ripeness of Barley, and of sowing Miller and Pannick. But this must be understood of the Countrey and place that *Pliny* then lived in. In all Countreys they have not the same time of Barly harvest, nor of sowing Pannick and Millet, though *Mantuan* sang to the same tune:

*Then is the time your barley for to mow,
When Glow-worms with bright wings themselves do show.*

Yet as I said before, the shining comes not from their wings. They shine not before the twilight in the evening, as *Politian* shewes elegantly:

*Then they renew their labour, till at night,
The little Glow-worms shine most clear and bright.*

Pliny calls these glittering Flies, earthly stars; *Nature*, saith he, crying out and speaking to countrey people in these words: Clown, wherefore dost thou behold the heavens? why dost thou seek after the stars? when thou art now weary with short sleep, the nights are troublesome to thee. See I scatter little stars in the grass, and I shew them in the evening when thy labour is ended, and thou art miraculously allured to look upon them when thou passest by; Dost thou not see how that a light like fire is covered when she closeth her wings, and she carrieth both night and day with her: So saith *Pliny*. Hence it is manifest that the shining doth not alwaies shew it self when she flies, though it shines forth both at her sides and thighs, because it appears not but to those that see her wings wide open, and lifted up, for where the wings are closed all the light is darkned. This flying Glow-worm, *Antonius Thylesius Bonfentinus* described elegantly in these verses:

*This little fly shines in the air alone;
Like sparks of fire, which when it was unknown
To me a boy, I stood then in great fear,
Durst not attempt to touch it, or come near.
May be this worm from shining in the night,
Borrow'd its name, shining like candle bright.
The cause is one, but divers are the names,
It shines or not, according as she frames
Her self to fly or stand; when she doth fly,
You would believe 'twere sparkles in the skie,
At a great distance you shall ever finde*

*Prepar'd with light and lanthorn all this kinde.
Darkness cannot conceal her, round about
Her candle shines, no winds can blow it out.
Sometimes she flies as though she did desire
Those that pass by to observe her fire;
Which being nearer, seem to be as great,
As sparks that fly when Smiths hot iron beat.
When Pluto ravish'd Proserpine, that Rapes
For she was waiting on her, chang'd her shape,
And since that time, she flyeth in the night
Seeking her out with torch and candle light.*

Those that are without as well as they that have wings do send forth such a bright light, that by it you may read a great print. In this also they surpass Moon and Stars, for that clouds and darkness soon eclipse their light; where it is so far from obscuring the lustre of those, that it rather increaseth it.

Thus far of those Glow-worms which are found in Europe.

Amongst those that are found out of Europe, that which the Inhabitants of the lesser Spain call *Cocuias* take the first place, because it yeelds a greater light, carrying a little torch before men in the dark. In Greek it may be called *καπαδαυμς*, because the light comes not from the tail but the head. It seems to be a kinde of Beetle, six times as big as the flying Glow-worm is

with us, not so great as a hazle nut, saith *Maïolus*, but sometimes bigger than two hazle nuts, in length two inches, and as thick as a mans little finger. *Cardane* saith well, that some of them are as big as the Hart-beetle; it hath a long head joyned to the body, the forepart whereof hath as it were in the middle a black spot in a manner triangular; it shoots forth short horns; the eyes are very big (so are the horns) standing out and black, and are placed near the mouth; the rest of the head is of a bright red, except it be two golden studs or bosses hard by the neck, out of which the glittering rayes, especially when it flies and the wings are opened, do issue with marvellous glory; six black feet come forth of the breast: the Case wherewith the silver wings are covered, appears of a chesnut colour; the body hath ten incisures or clifts of a blackish ash-colour. This Cicindele, together with the

Figure of it came from a most skilful painter, who had taken strict observation of it both in the lesser Spain and in Virginia. In Hispaniola they are almost all the year long, for they have seldome any winter.

In the Commentaries of Navigation this Glow-worm is thus described: The *Cocnio* is four times as big as our flying Glow-worm; it is of the kinde of Beetles: the eyes whereof shine like a candle, with whose brightness the air is so enlighthened, that any man may in his chamber, read, write, or do any necessary business. Many of them joyned together make such a light that an army may march by them whither they please, maugre all winds, darkness, rain or storms whatsoever. Their wings being lift up and also towards their shanks they shine very gloriously: the Inhabitants before the Spaniards came thither

made use of no other light, neither within nor without their houses. But the Spaniards (because these lightsome creatures do by little and little lose their light with their lives) do use within doors about their business lamps and candles. But if they are to march forth against an enemy newly arrived, they make use of them to conduct them, and each souldier carrying four of them about him, divers waies couden the enemy. For when as that noble traveller Sir *Tho. Cardane* (that compassed the world) and *Robert Dudley* Knight, son to *Robert* Earl of *Leicesters*, first landed in the *Indies*, and that very night that they came ashore, saw hard by in the woods an infinite number of moving candles and torches as it were beyond their expectation, they thinking the Spaniards were come upon them unawares with guns and pistols and much light, speedily berook them to their ships. Many other Insects of this kinde are there to be found. But because this seemeth to be of most account, and to have the preheminnence above the rest, *Oviedus* hath left the rest undescribed. The *Indians* use to rub their faces with a paste made of them, that so their bodies may seem all of a flame. How this may be, since as is said before, the light vanissheth with the life, I do not see, unless it be that the light may endure a while after they are dead, but that long it cannot remain is manifest by experience.

The *Indians* finding so great need of them, in that they could not rest in the night for the Gnats stinging them (the which these Glow-worms being kept in the house did as greedily hunt after as Swallowes do Flies) and because they could not work by night without this lanthorn of nature, before such time as the Spaniards came thither; they bethought themselves of some means whereby to catch them; the which I shall shew partly out of *Peter Martyr*, partly from those reports of others which were eye-witnesses of the same.

Whereas the *Indians* were constrained by reason of want of light to lie all the night idle, they got them out of doors with a lighted firebrand and crying aloud, *Cucnie, cucnie*, they do so beat the air, that either for love of the light they fly to them, or for fear of the cold they fall to the ground; which some with leaves of trees, others with linnen rags, othersome with little nets made for the purpose detain, till they can come to take them with their hands.

There are other little flying beasts, which shine by night, but a great deal bigger than ours, and sending forth a far greater light. For they shine so bright that those which take long journeys make them fast by a way to their heads and feet being alive; for so they may be seen afar off to the astonishment of those that know not the matter: the women use no other light to do their business withall by night within doors but these. *Oviedus*.

There are yet other worms of another form, which give light by night, as we read in the Commentaries of Navigation. In the Island called *Hispaniola*, there are two sorts of worms which shine

shine by night. Some of the length of a mans little finger, slender, with many feet, glistening so bright in the dark, that a man may see all round about him for fifty or an hundred paces easily. That clear light shines forth only out of the clifts, or if you will the junctures of the body near the feet. There are others like to these in bigness, and altogether as lightsome, but only that their light issues from the head. Those things we finde in the histories of Navigation. But whether these *Cicindela* be of the kinde of of the *Juli* (as I think them to be): or whether they be like to ours, is not declared. But I guesse them so to be by the multitude of the feet they have; for the Author reckons them in the number of the *Scolopenders*; *Valerius Cordus* in *Dioscor.* makes mention of the *Scolopender* (as he interprets it) whereas it is indeed a kinde of the *Juli* which in moist places, and in rainy weather shine very bright. Such a one my friend *Brewer* found in *England* in the heath grounds, and sent the worm dryed to *Pennius*. But that every man may better understand it, I shal set down his own words: I twice found a *Scolopendra* that shines in the night (yet as I said they are kindes of *Juli*) in summer nights, of a shining hery appearance, in heath and mossie grounds. The whole body shines something more darkly than a glow-worm. He further adds, It once hapned that I came sweating home to my house at night, that I wiped my head in the dark with a napkin, the napkin seemed to me all over of a flaming fire; whereupon I wondered a while at this new miracle, all the lustre seemed to draw to one place, then folding the napkin together, I called for a candle, and opening the cloth, I found such a *Scolopendra*, which I had rubbed against my head, and had caused this itrange light like fire: Thus far *Bruerus* who affirms that it was like to the *Scolopenders* commonly so called in gardens, and under stones and earthen vessels, wherein women are wont to set their choicer plants or slips. All the Summer time and Autumn (saith *Gaudentius Merula lib. 3. memor. c. 61.*) in grassie ditches and without water when I was at *Lebetium* (which is now called *Samzarius fore*) I gathered little shining hairy worms in the night. The same I saw in the ditches about *Viglevianum* (which of old was called *Vergeminum*) as *Simon Puteus* and I were walking abroad in the evening to take the air. But what those hairy worms should be, unless they be a kinde of *Juli*, I do not know. There is another worm altogether unlike these of which we read in the *Book of the Nature of things*: There is (saith he) a worm like a star, which shines like a star in the dark, it is never seen but in great rains, and then it foretels fair weather to come shortly after. So great is the coldness of this worm, that it will just like ice put out the fire.

If a mans flesh be but touched with the slime of this worm, all his hair will come off; and whatsoever it touched therewith it changeth the colour of it into green. But all these he handleth untowardly, for he confounds the *Stellio* (which he here calls *Stella*) with the *Salamander* and *Cicindela*, and of these he maketh a very confused and imperfect History. Neither doth *Guillerinus de Conchis*, nor *Vincentius* (which transcribed all almost out of *Guillerinus*), in his obscure and dark tract where he reports this story, correct it. But these things are nothing to the *Cicindela*, and that which they write concerning the *Salamander* is other where amended. Hitherto of Insects shining in the dark.

Whether or no the Glow-worm being dead doth retain its splendor and shining, is wont to be a question. *Massarius* a very learned man writing on *Pliny* his 9. Book, saith it doth, and that boyes taking the Glow-worms used to put about their heads the shining parts of them; with which if the hands or other parts of the body be rubbed, they also will shine in the dark. But by the leave of so great and learned a man as he is, experience reacheth the contrary. For after the Glow-worm is dead, that part whereof which so shineth in the night, though not presently, yet within a few hours after is quite lost; and seems altogether to go away with the vital spirits: this is a clear case, from experience, and I have often tried the same. This I will grant: if a certain number of those that have no wings (for those that have, shine not but only when they fly) be but put into a clear Crystal glasse, so that the air may freely come at them, with a little grasse, they may perchance give light for the space of some 12 daies, if every day fresh grasse be put to them; but at the length as they languish and faint away, so the light by little and little is remitted and slackned, and in the end they dying (as before is said) it is totally extinguished.

Vainly therefore do some boast of compositions made of them, with which they will keep perpetual light, as they suppose (amongst whom is *Cardanus*) as if they would bring down the Moon from heaven. Others there are not learned only but unlearned also, who have committed these compositions to writing, whereby they might the better betray their own ignorance. Of this perpetual light *Albertus* makes mention, who in his Works gathers a whole bundle of flies together as it were into one body. And here now I will set down some of them that the Reader may be aware of them, and the vanity and levity of the writers themselves may be manifested. Some there are which take a great many Glow-worms, beat them together, put them into a vial of glasse and bury them fifteen daies in horse dung. Afterwards they distil them through an Alembick, and keep the water in a clear glasse. To this end *Gaudentius Merula*, who hath heaped up many things together from this and that Author, without any judgement, hath these words: Of these Glow-worms being putrefied, there is made a water, or a liquor rather, in a vessel which will wonderfully shine in the dark. Such a light doth this water or liquor give, by report, that in the darkest night any one may read and write, and do any other business as he pleaseth. Others left they should seem not to add to what is invented to their hands (for pregnant wits, unless they bring forth some novelty are not well) together with the Glow-worms digest the gall of the Tortoise,

of a Weasel, and Sea-dog, putting them in dung, and afterwards they distill them. This water they say far excels all other whatsoever in lustre. Others put whole Glow-worms in dung for nine daies to digest, others for three weeks, then throwing away the Glow-worms, they take the fat of them and keep it in a cleane glass for to use. Some yet more fondly take Glow-worms, and casting away their heads, they put to them the scales of fishes, and rotten shining wood, such as glissens in the dark, with the galls of Sea-dogs, and so distill them through an Alembick. Others promise confidently to make letters to shine in the dark, by pricking out the yellow moisture of the Glow-worm, and anointing therewith the paper, or painting it with the same liquor in form of a star, some rub them with the oyl of Linseed upon marble, and whatsoever you shall paint or write, they perswade us, may easily read in the night, be it never so dark; but let them believe them that have made the trial. Others after they have digested in horse-dung nine daies, take the liquor that is left in the bottome of the glass and write with it, and so think confidently to obtain their desire. *John Arden*, a skilful Chirurgion, an English man, walking after their steps, above thirty years ago left such a description of this perpetual light in writing: He gathereth a great number of Glow-worms, and shuts them in a glassen vessel well stoppt, laies them in dung fifteen daies, then puts the water he findes in the bottome of the glass into a cleane glass; to which he adds as much of Quicksilver, the dross being purged from it, and then he saith you must shut the glass mouth very close, and hang it where you will, and then for certain (as he affirms) it will produce the wished effect. Some have told me that this is very true, whom notwithstanding I will not believe untill such time as the experiment be made before mine eyes. These and many the like you may finde by readings, but what credit may be given to them is easily conjectured out of what went before. Hence then we may plainly understand how foolishly and vainly mans wisdom doth many times vaunt it self, and whither our wits may be carried, if not founded upon right Reason, the mistress of all Arts and Sciences, thunning with all diligence the uncouth rocks of opinion and self conceit.

How wonderful the works of God are in our eyes, none can be ignorant, who shall diligently consider this little creature and weigh its nature, and its light resembling that divine light. For who is he that beholds the vanishing light of this, that doth not fix the eyes of his minde upon Christ the lasting, true, and the chiefest light of the world; and doth not call to remembrance, that holy Spirit which doth illuminate our spirits in the most obscure darkness of our understandings? But this inbred light of the Glow-worm, or rather borrowed light which some seek to extract, others strive to imitate (as for example, *Albertus*, *Cardan*, *Merula*, *Vitalis*, *Mizaldus*) have shewed themselves very fools in my judgement. Neither have they been warned by the fatal end of *Salmones* or *Alladius*, who going about to imitate *Jupiters* thunder and lightning, were therewith by him struck dead, and so did reap a just reward of that their impious presumption, for they felt the force of true heavenly fire, who thought to counterfeit the like with a vain crackling. Even so the wits of these times, while they seek to extract this light, by their bold enterprise do violate the Deity, and while they would seem to adorn and set forth the glory of that his work, they rather detract from it and disgrace it. But we leave these to *Ixions* wheel, and proceed rather piously, and modestly to behold the majesty, wisdom, and divine light in this little creature. For he which shall go about fully to search the majesty of the Creator in these small creatures shall soon be confounded with the glory of it.

What necessary use the *Americans* made of them in their night journeys and business, before the *Spaniards* brought in the use of Lamps and Torchés, hath been said already.

But we that live in *Europe*, as we travelled by night (I remember) in *Italy* and other places, we took a great deal of delight in them, not so much because they dispelled the darkness with the beams of their splendor, but because they did illustrate the earth with their celestial light, which compared with the light of the Sun and Moon, were not to be despised.

Neither do they only please the eye, and instruct the minde, but they are good for the body in divers diseases, for the female *Cicindele* being put into the matrix of the mule, causeth the woman that bears childe with much danger, to be barren; saith *Kiranides*. *Cicindeles* being drank in wine make the use of lust not only irksome but loathsome, as *Benedictus* saith; the same also *Gilbertus* an English Physician, *Albertus*, *Nicolaus*, *Florentinus*, and *Rhasis* do confidently affirm. It were worthily wisht therefore that that unclean sort of Letchers were with the frequent taking of these in Potion disabled, who spare neither wife, widow nor maid, but defile themselves with lust not fit to be mentioned. *Rhasis* saith that the Glow-worms are very good for the stone, if beaten with oil, and therewith the place having the hair clipt off, be anointed, which will never suffer it to grow afterwards. *Bairus*. If they be beaten and put behinde the ears, they will divert and evacuate all Rhumes falling into the eyes and teeth. *Anonymus*. The Inhabitants of the Isle *Sorida* take a good sufficient quantity of them, and mixing them with fresh black wax make them into a mass, and lay it in the hot sands till it be half consumed away: of this mass of the bigness of a walnut, both young and old do take two hours before meat and two hours after; which do not only infuse heat into the obscene part, but vigour also. *Thevetus*. But this is not to be understood of the ordinary or common *Cicindele*, which as is aforesaid causeth sterility and barrenness; by these *Thevetus* meaneth those Glow-worms reckoned amongst the kindes of *Juli*, the which being taken in drink do after the same manner with the *Cantharides*, as *Merula* writeth, provoke both seed and urine. *Alexius* very highly com-

commends them for excellent baits to fish withall, being fastened to the hook. *Weckernus* saith that by a gentle decoction of them in a glass *Alembick*, is made a water very useful to that end. But I am rather of *Alexius* minde, the which experience also confirmeth.

CHAP. XVI.

Of the Locusts.

THE Locust is called of the Arabian, *Gieat*, *Gierad*, *Gerad*; of the Illyrian, *Kobilka*, *Bruck*; of the Slavonian, *Knonick*; of the French, *Sauterelle*, *Sautereau*, *Languste*; of the Spaniard, *Lagosta*, *Gasanhote*, *Gaphantoles*; of the Italian, *Cavalerto*, *Soliotta*, *Saltello*; of the German, *Henschreck*, *Sprinckhaen*, *Sprinkell*; of the Dutch, *Hyperlinck*; of the English, *Grasshopper*, from leaping upon the grass; of the Latine, *Locusta*, as some think à *locis ustis*; for that they scorch all places where they touch, and eat up and devour all things; of the Hebrew, *Arbeth*; of the Polonian, *Konick*; *Szarancza*; of the Hungarian, *Saska*; of the Greek, *ἀπὸ*, *αὐτὴ* τὸ *ἀπὸ* τῆς *ἀσάχου* ἢ τῆς *φύσεως* τῆς *αὐτῆς*, whence comes the diminutive *ἀνίσκος*, *Locustula*, vel *Locustella*, a little Locust. The Ionians call them from the number of their wings *Tetrapleurides*; that is to say, four winged creatures; others call them *Cornopas*, *Parnopas*, and *Pornopas*; from whence *Hercules* and *Apollo* were called of the Athenians *Parnopii*, because they drive the Locusts out of their countrey, as *Pausanias*, *Hermolaus*, *Calius Rhodoginus*, *Lilius Giraldu*, *Camerfius*, *Strabo*, &c. have observed. Notwithstanding the word *parnopas* (if the interpreter of *Aristophanes* deceives us not) signifieth that sort of Locust only which is easie to be handled with the hands. But before we enter into the description and division of them into their several kindes, I cannot but admire with *Marcellus Virgilius*, the workmanship of Nature, in which I know not, as I may so say, whether she did more seriously sport her self, or more sportingly labour. For who first of all is able to describe so many colours in one body? who is able to set forth so many divers shapes of bodies, goings, leapings, flyings. For some there are green, some black, some blue, some one part of them of this colour, on the other of another. There are those which are of another colour in their flight, then they seemed to be of before. There are some fly with one pair of wings, others with more; those that have no wings they leap, those that cannot either fly or leap, they walk; some have longer shanks, some shorter, and amongst these some have more and shorter joynts, some fewer and longer, some there are that sing, others are silent, as the *Seriphia*; some do no harm at all to tillage, so that children may take them up in their hands without hurt: others on the contrary are the pest and destruction of all that up growes through a whole Countrey.

And as there are many kindes of them in nature, so their names were almost infinite, which through the neglect of Naturalists are grown out of use.

Now all Locusts are either winged or without wings. Of the winged, some are more common and ordinary, some more rare; of the common sort, we have seen six kindes all green, and the lesser of many colours.

The first of the bigger, hath as it were a grass cowle or hood which covers the head, neck, and almost half the body: the wings come from the neck underneath, of a greenish colour, speckled with a few small black spots, the back green, the belly dusky coloured, the tail or stem at the end blackish; it hath a great mouth, and strong big teeth, excellently made to devour the fruits withall. The second seems to be like this, but that the hood is fastened to the neck; the nose also and mouth are more red, and it hath greater spots in the wings. The third is of a green countenance, the shanks whitish, the tail blackish, the wings beset with greater store of spots, and about the edges of a pale red.

Now these are females, from whom the three males differ in this, that either in the end or above the tail they have two or three prickles or stings, and the middle of their hood appeareth more red.

The first sort of the lesser Locusts, called of the *Tigurines*, *Holtspecht*, is in body black, the utmost wings spotted, the innermost spattered with virmillion; the thighs brown or swarthy, with black lines curiously drawn up and down. Of the second the cornicles, eyes, and shanks are of a pleasant red, the thighs or shanks are also diversified with black lines, the wings speckled, the belly of a dark red upon yellow, all which do exhibit a very fine pretty creature. The third seems to be of a dark ash-colour, the cornicles very short, and the wings of an unusual length, longer then the body. The fourth is all over of a darkish green, but that the hood is set with two black lines, and the ends of the shanks are of a lively shining red. The fifth is a little lesser than the rest, but in ordering and variety of colour, more pleasant to the sight; the body, head, and feet are of a faint red, with green wings, and a golden lace drawn through the middle of the head very bright and shining.

All those of the lesser sort have wings as long or longer than their bodies, they have besides no sting or prickle in their tail, nor bear any stem; they are seldome seen in the corn but altogether in meadows and pastures, as I have seen them in *France*, and our Countrey of *Britannie*: I have seen only three kindes very rare, i. e. *Italian*, *Greek*, and *African*: they are called *Mantes*, foretellers, either because by their coming (for they first of all appear) they do shew the Spring to be at hand, so *Anacreon* the Poet sang; or else they foretell dearth and famine, as *Calius* the Scholiast of *Theocritus* have observed. Or lastly, because it alwaies holds up its forefeet like hands praying as it were, after the manner of their Diviners, who in that gesture did pour out their supplications to their

their

their Gods. Of this *Italian Mantis* (whose figure we do here represent) *Rondeletius* makes mention in his book *de Piscibus*, in these words: *It hath a long breast, slender, covered with a hood, the head plain, the eyes bloody, of a sufficient bignesse, the cornicle short, it hath six feet like the Locust, but the foremost thicker and longer than the other, the which because for the most part she holds up together (praying-wise) it is commonly called with us Preque Dieu, the whole body is lean.*

So divine a creature is this esteemed, that if a childe aske the way to such a place, she will stretch out one of her feet, and shew him the right way, and seldome or never misse. Her tail is two forked, armed with two bristly prickles: and as she resembleth those Diviners in the elevation of her hands, so also in likeness of motion; for they do not sport themselves as others do, nor leap, nor play; but walking softly, she retains her modesty, and shewes forth a kinde of mature gravity. Though *Pennius* affirms that he often saw this kinde at *Montpellier*, yet in his papers he saith that he received the figure of it from the worthy *Antonius Saracenus*, a Physician of *Geneva*.

Another species of this *Mantis*, *Carolus Clusius* sent from *Vienna* exactly described, being brought thither out of *Greece*, which is like unto the former in shape and magnitude, but of another colour bestowed on it either by nature or the place where it lives; for it hath cornicles of a full yellow, the eye of hyacinth colour, the wings of a faint yellow, the rest of the body of *Amythist*, only that the feet shanks, as also the joynts of them were more hairy and white, and the claws of the fingers bended backward were black.

I procured one from *Barbary* that was brought out of *Affrick* with some cost to us, slender, five inches long, hooded, the head pyramidal, very long, out of which almost at the top came forth two little broad cornicles about an inch long, much like that *Turbant*, which the *Tur-*

kish Janizaries use with two feathers in it: a little below the root of it come forth two eyes standing out, great, and of a dark red, the body long, of a blond red purple; the tail like a Swallow two forked, four wings of somewhat an ash-colour, deckt with certain dunnish spots; the four former feet and shanks very slender; the hinder strong, brawny, and long, and by reason of the spots drawn athwart all along the thighs blackish. And this of the common or ordinary and winged Locusts, and of the rarer sorts shall suffice to have been said; unless the Reader shall think fit with me to add more differences of them. The face of the ordinary Locusts is fierce, long, wrinkled, fenced as it were with scales, which even cover the mouth: in the upper part they have teeth fastned that are broad, black, and very hard, with which they easily eat ears of corn, and scratch them with a great noise. The *Greek* and *African* Locust appears with a shorter

ter face, and the teeth are so weak that it can feed on nothing but the softest grass, and tops of hearbs. The common ones have very long horns, but the *Manti* have very short ones; they have a hard breast, gristly, strong, none of these almost is faint or weak. They have also a soft belly, long and pointed, but these have a hard full brawny belly; both of them have four wings that are skinny and membranous, as made of the fibres of nerves; for though the inward wing folded seems two, yet it is but one, when it is stretched forth: which deceived *Jodochus Willichius* in his Dialogue of Locusts, for his eyes deceived him, when he writ that Locusts had six wings, which is false. It is very pleasant to behold in some Locusts their thighs with six angles, exactly smooth in their void places, and artificially painted in their netlike weavings together: the ordinary Locusts have great eyes putting forth, whence *Athenaus* calls one *Ebulus*, lib. 10. c. nlt. *Ἀφελόρβαλον*, *Locust ey'd*; *Nigidius* said at large that Locusts could not see, as *Pliny* relates, lib. 11. cap. 37. yet have they clear eyes like glass, though covered with a horny membrane: Nature disproves this lie of *Nigidius*, which made their whole eye partake of seeing. As for colours, Nature that paints creatures, never was more bountiful in it, for though commonly with us they appear green, yet we see some of them red, yellow, crimson coloured, purple; and out of *Morocco* all white; and *Alian* saith, that in *Arabia* they are of a golden colour, lib. 10. c. 13. de *Animal*.

Their Copulation and Generation.

Concerning the copulation of Locusts, I rather subscribe to *Valeriola* (who hath searched diligently into their nature) than to *Aristotle* himself. They couple, saith he, (as I have seen) by the male getting upon the female, at what time he puts those two prickles that come out of the end of his back into the matrix of the female, and so they continue in conjunction very close and for a long time, in so much they can scarce with your hands be pulled asunder when once coupled, neither by leaping and motion, or any other way. The female being tickled underneath, moveth her womb very busily, and applying her self with the bottome thereof to the male, doth hold him for a long while, sometime with the opening of the matrix, sometimes with the shutting or closing of it again, augmenting the pleasure of her venery: for while the matrix is open the male gets into the bottome or farther end thereof; and when it is contracted or closed, she is delighted with the affriction and tickling of the womb and the passages thereof. Now there are to be seen two passages in the secret part of the female separated by a kinde of partition, and are covered over with a little thick cover, which in the outside is black, hard, and gristly, but within somewhat roughish, hairy and wrinkled; at the bottome of this the matrix appears whitish like that of Women.

Now the female bringeth forth (as *Aristot.* saith) the little stem that growes to her tail, being stuck in the ground, and then layeth all her burden together in the same place, not scattering up and down, but as it were like a honey comb. Hence proceeds a kinde of little worm in the likeness of an egge, included in a little earthly thin membrane, the which being forced open, out come the Locusts and fly abroad. But (by the favour of so great a Philosopher) they lay eggs indeed in the beginning of Autumn, though not of the fashion of eggs, as I have seen with my eyes, and have had them in my hands. The which feture is so tender, that with the least touch it is bruised to pieces. Neither is it laid upon the superficies of the earth, but somewhat deeper, and in the winter under ground: where in the winter they being perfected by concoction, in the subsequent year, almost at the latter end of Spring they come forth out of the shell or membrane aforesaid, wherein they were, being little blackish Locusts creeping up and down without either shanks or wings, which afterwards in a short time become bigger. They bring forth at the latter end of Summer, and when they have so done they forthwith die, certain little vermine breeding about their necks (as it happeneth to the Beetle) in the time of their bearing, which do strangle them. These dying after such a foolish fashion as they do, are yet able at their pleasure, any one of them, if it do but fasten on his chaps, to kill a Serpent. In a wet Spring the eggs perish, but in a dry then there is a great increase of them. Some will have them to be brought forth and to dye twice a year, (in the number of whom is *Willichius*) that is to say, at the rising of the *Pleiades* they come forth, and dye at the setting of the *Dog-star*, then others to be brought forth. Some say at the setting of *Arcturus*. In mountainy places, and of a thin air there breed no Locusts, but in plains and places full of cliffs and chaps; nor do they lay their egges upon the superficies, but in the chinks and caverns of the earth, both that they may be the better concocted, as also better preserved from cold and rain.

That they should be generated of the carcase of a Mule or Ass (as *Plutarch* reports in the life of *Cleonides*) by putrefaction, I cannot with Philosophers determine; first, because it was permitted to the Jewes to feed on them: secondly, because no man ever yet was an eye-witness of such a putrid and ignoble generation of Locusts.

Their Death.

They dye several waies. For the male after copulation (wherein he carries very long, and as it is probable, till all his radical moisture, and all his spirits at once are exhausted with his venery) presently expires. As in like manner all the females as soon as they have brought forth, whether with vehemency of pain, or numerous feture, I know not, the which being very great cannot chuse but spend and exhaust the strength thereof. Oftentimes also great swarms of them being lifted up into the air by the wind, which afterwards failing, they fall down into the sea, or standing lakes. They are reported to pass over to far remote shores, continuing their journey for many daies together, they are to be seen very great, and also they make such a noise with their wings, that you would think they were a flight of birds, and they darken the Sun. They

They come oft-times out of *Africk* into *Italy* in great numbers, biting and gnawing all with their teeth, even the doors of their houses. Neither do they hurt the corn fields, pastures, meadows, The mischief gardens, orchards, with their biting only, but also with their black, burning stinking dung, and especially they do. cially with their cholerick and bitter fume or spittle, the which (as *Valeriola* witnesseth) they vent in great abundance out of their mouthes as they bite. Yet notwithstanding they are not venomous, the *Parthians* and certain of the *Ethiopians* live of them, esteeming them very dainty meat. They are said in *India* to be three feet in length, their shanks and thighs when they are dry serving for sawes to saw withall. That sound or noise which they make, *Aristotle* saith is made with the rustling of their wings. But according to *Pliny*, it seems to proceed from the hinder How the Locusts make a noise. part of their head. But I suppose it is caused three manner of waies, by the grating of their teeth as they bite the herbs, with the clapping together of their wings as they flutter up and down with them, with the rubbing of their hard neck and shoulders one against the other whilest they leap and themselves like fouldiers, armed with helmet and brestplate, are used to do.

Now we are to speak of the Locusts which have no wings, and those especially are *Bruchus*, *Attelabus*, and *Asellus*.

The *Bruchus* taking his name from biting and devouring, may be called a Locust without wings. And τὸ βρῦ. destroying and devouring the herb of the field. Four sorts or species of them are here presented καὶ, i. e.

to view: the first is of the male, the second females. The Male hath a pale bloud colour circle or collar about his neck, under which hangs a double hood of a light yellow, and green, mixt; from the back to the tail it is set out with six leek coloured plates running across from the back to both sides. The belly, which is sufficiently great, with the three prickles of the tail, are of the colour of an herb newly prest out of the earth, of a yellowish green, as also the thighes, face and cornicles; but the shanks seem reddish. The first of the females is all over eruginous, but for a bloud colour line running over the back from head to tail: it is without a prickle growing in the stem or tail; it seems also to be girt about with ten green plates, or rounds. The second is almost

all over of a light red and brown, the belly a little yellowish, the upper end of the stem it hath two prickles. The third hath a head resembling a hogs or sea-calfs head, in stead of cornicles it hath a little beard on each side of the nose; the two bunches or swellings on the top of the forehead are like to the ears of a Bear, and it hath two prickles upon the stem very sharp and brown, of the same colour with the rest of the body. These did that famous knight Sir *Edmund Knivet*, freely send in picture to *Pennius* for the enlargement of this work, for he is a Knight that is very courteous to learned men, and singularly noble both by descent and vertue, and famous for his curious search into the knowledge of natural things. The Latines call them *Bruchi*; the Moscovites, *Chrzaft*; the Polonians, *Knomic*, the Germans, *Ramp*; the English, *field Crickets*. *Attelabus*, is a small Locust, saith *Hesychius*, *Pliny* thinks it one of the smallest kinde; *Hierome* on the 3. chapter of the prophet *Naum*, calls the little off-spring of Locusts *Attelabi*; *Aquila* more significantly interprets them devourers. A little Locust is said to be the mean between a Locust and *Bruchus*; it hath such little wings that it is reputed to have none, and seems rather to creep than fly: for this cause wheresoever it is bred, it bringeth all as it were to meal or rust, by grinding and consuming. It seems to some to be of the kinde of *Bruchus*, till the wings grow forth, and then it growes into the number of Locusts. *Stephanus* derives *Attelabus* from *ἀττελ*, because the wings seem so small as if it had none. The *Attelabi*, as *Aristotle* saith, do breed in fallow fields, as Grasshoppers do; they bring forth, and when they have brought forth they dye as other Locusts do; their eggs are spoiled by wet Autumns, when the waters increase too much; but in a dry Autumn, the *Attelabi* increase more, because their eggs escape drowning. *Asellus*, or *Ὠρέ*, as *Dioscorides* calls it, hath its name from its slow motion, it hath no wings, thick legs, but short withall, not like other Locusts, whence it seems rather to creep than leap, it hath a great belly hanging down, as if it were made to devour corn. This Locust it may be is called in Scripture *אִתְלָבִי*, *Nicanor* calls it *ואטלבי*, and *אסלוב*; though, as *Clitarchus* saith, in the Dialect of the *Ambraciata*, all Locusts are called *αδσαν*, because they eat corn with a noise of their teeth. *Franciscus Stancarus* writ a little Tract of seven kinds of Locusts, according to the Scriptures and Rabbins; but he described not those four which are numbred amongst clean birds that the Jewes might lawfully eat; those four were *Arbeth*, *Salaam*, *Chargel*, and *Chagab*, which the Chaldeans call *Gebah*, *Rhaschen*, *Chargola*, *Chorgeba*; and the Greeks call them *ἀκείδω*, *ἰπιδιμαγ*, and *ἀνιλας*. *Arbeth* is a kinde of Locust, called so from her fruitfulness, as *Kimbi*, *Munster*, and *Broughton* observe. The *Septuagint* have translated *Salaam*, *ἀνιλας*; *Hierome* doth not rightly call

call it *Scarabeum*, for it is a flying creature, creeping with four feet, and leaping with its two hinder feet longer than the former feet. *Kimchi* makes it a kinde of Locust which the Rabbins call *Rhaschon*; *Abenezra* thinks that to be called *Salaam* that sits amongst stones; and *Himski* subscribes to this opinion, the foresaid interpreters called *Chargol*, ἐπιμαχον, for it fights with the serpent, and stopping the chaps thereof, it kills the Serpent: *Aristotle Hist.* 9. cap. 6. saith, that many have seen τὴν ἀνείδαν, the Locust called ἀνείδαν, which when it fighteth with the Serpent takes him by the neck. *Niphus* needed not interpret that ἐπιμαχον to be the *Scolopendra*, or Viper, since the Philosopher calls it directly ἀνείδαν, and the 70. learned interpreters say it is a Locust: however it seems *Niphus* was so blinde that he thought it impossible for so small a creature to kill a Serpent, but we thought it safer to relie on the testimonies of so many learned men, (who had an insight into Locusts, and almost into all natural things) than upon the conjectures of so frivolous a Commentator and deviser of novelties. *Hagab* or *Chagab* is called *Attelabus*; *Hierome* calls it *Attacen*. Amongst the Locusts spoken of, this is reckoned to be the last, and is set in the last place, as likely to be the most grievous; for this not only tastes of corn or shears it, but breaks and grinds stalk and all. It is bred of egges in a land fruitful for corn, which the female left there when the corn was gone.

Kindes of
Bruchi.

Five other kinds of Locusts are numbred up, *Joel* 1. *Amos* 4. *Deut.* 28. and *Psal.* 78. namely *Gaza*, from shearing; *Jelak*, from licking; *Chazih*, from destroying; *Theletsah*, from the blasting and rust it brings to corn; and *Chenamal*, from staying; because where it sets up its station, it carrieth there, and forsakes it not. *Rodolphus Modius* on *Leviticus* and the Prophet *Joel* reckons divers kinds of *Bruchi*; some are golden colour, others yellow, others gray; also from a whitish wormin frothy dew that in *May* sticks to plants, a certain winged green creature is bred, in form like to the smallest kinde of Catterpillar, first it leaps, and afterwards it flies, and therefore I think fit to call it *Locustella*, a little Locust. The English call that frothy matter *Wood-sear*, as if you would say the putrefaction of the wood. The Germans call it *Cuckow-spittle*: but what form that was of which *Suidas* calls μολαίς; *Celins*, μολαίς; *Nicander*, μολαίς; *Hesychius*, βρέθνα, ἀχρεῖς, πελάλι, ἀρπυί, δολαχότροχ; *Aristophanes*, πάρου; *Eustathius*, μάσαξ; *Phavorinus*, ἀλγύ, and πωλίς; *Isidore*, *Ludolochra*; truly I cannot tell, and I would gladly see some *Oedipus* who would declare their nature and use. But because *Marcellus* affirms that there are some Locusts that use but two wings: and *Willichius* ascribes to some six wings; they should either have described them, or have held their peace in a matter that exceeds belief. Also he slipped very absurdly, when he assigned a King and a Monarchy to be amongst them. May be amongst many little ones he found one great one, and saluted him for their King, because he excelled in magnitude; but *Solomon*, (that was of Philosophers and wise men the chief) saith they have no King, but are subject to a Common-wealth as *Pismires* are.

The mischiefs
Locusts do:

How God by these very little creatures did punish the pride and haughtiness, and hard heartedness of *Pharaoh*, is apparent enough out of *Exodus*, and is spoken of every where. In the year 170. before the birth of Christ, all the meadows almost were covered with clouds of Locusts, and a hundred years after about *Capua* a great multitude of them filled the countrey. *Julius Obsequens*. In the year after Christ, 181. the war long enduring in *Illyricum*, *France*, *Italy*, and at last being ended, that nothing might be wanting to punish those Nations, an innumerable company of Locusts, and far greater than the ordinary ones, consumed all the grafs round about. In the year of our Lord, 591. when *Agilulphus* reigned in *Lombardy*, a very great plenty of Locusts afflicted the Countrey about *Trent*, which are reported to be brought out of *Africa* by force of the winds; but the greater part of them were cast down with storms and drowned: but they were no less hurtfull and deadly to the *Italians*; for by the waves they were brought to the shores of *Cyrenis*, and by their venomous stinking smell, they caused such a plague amongst mortals, that *Julius* writes, that of men and cattel there died above 800000. Also at *Venice*, and about *Brescia* for want of corn, (for the Locusts had consumed all) so lamentable a plague followed, that in the year 1478. when these things hapned, above 30000. men died of it. Again in the years 593, 693, and 811. Locusts came flying out of *Africa* after a great drought, that devoured plants, herbs, and barks of trees, whence followed a strange famine, and such as is elegantly described by the Author of *Naumachia*, in these verses:

The nurse childe of death,

Famine was present with her empty veins,
The poor with hunger starved, their breath
Was spent; for neither broth nor bread remains:
Upon their mouthes and guts hunger laid hold,
They move their chaps, and bite their teeth, not meat,
Through wrinkled skin their bowels might be told:
Nothing but skin and bones, they'd nought to eat,
In stead of belly stood an empty place,
The brest hung down, and seemed for to stay
On the back bones rough grate, pale was the face,
Lips white, eyes sunk, teeth stark, all was like clay.

Nor

Nor was *France* free from their teeth and devouring, but in the years since the time the *Virgin* brought forth her son, namely in the year 455, 874, 1337, 1353, 1374, was miserably warr'd, and the Citizens consumed by famine, and very many killed by a plague that followed it, and sometimes it lost a third part of the inhabitants. These Locusts had commonly six wings, and were brought thither from the East. But at length by force of winds they were carried into the British Sea and drowned there: but by the flowing of the sea they were cast to the shore, and infected the air, and caused a plague no less cruel than the famine that went before. *Otho Frisingensis*. Also in the year 1476, they wasted almost all *Polonia*. In 1536, innumerable troops of Locusts were brought by winds from the Sea *Euxinum* into that part of *Sarmatia* which is called *Podolia*, they did change their camps in a military order, and they eat up all that was in the fields where they pitched both by day and night; these of an unusual greatness at first wanted wings, then their wings growing forth, they flew at pleasure; and what shall I say? they eat not only herbs and leaves, and flowers, but hardly left any bark on the trees. Then they wandred through *Germany*, and came as far as *Millan*, and having devoured all there they returned to *Polonia* and *Silesia*. At last in *November*, for so long they lived, when they were consumed by force of cold, they raised such a stench, that had they not been eaten up by hogs, and wilde bores, they would have caused as great a plague, as they had done a famine in *Germany* and *Italy*. In the year 1543, Locusts did a very great mischief to the Countreys of *Misnia* and *Marchia*: at which time they were so frequent in *Lucania*, that being in heaps they were above a cubit high. *Jacobus Eckelius*. In the year 1553, it is commonly known what great damage the mighty company of Locusts did at *Ayles*: whilst we were writing this, we received news that the *Spaniards* were sorely afflicted with swarms of Locusts brought thither out of *Africa*. For they flew like Armies through the skies, and darkned the air. And the people when they saw them, rang all their bells, shot off ordinance, sounded with trumpets, rinkled with brazen vessels, cast up sand, did all they could to drive them away; but they could not obtain what they desired, wherefore sparing their labour in vain, they died every where of hunger and contagion: as the Mariners and steer-men reported to us, who escaped very hardly from that danger themselves. *Entropius lib. 4.* makes mention of very great Locusts, which were seen not far from *Rome*, to the wonder and amazement of the beholders, the inhabitants were so afraid of them, for their devouring nature, that they were frighted at their sight. Hence we may collect that those creatures are not the smallest amongst the Armies of the Lord of hosts, when he pleaseth to punish the sins of men, and to revenge himself on the despisers of his Lawes. But as his Justice is admirable, so in his greatest severity Mercy is not wanting; for being that Locusts have brought sundry Nations to want and hunger, and they have had no thing to eat, these Locusts have died suddenly, and became meat for the people they afflicted before: the people of hot Countreys, Their Use. (whom especially they spoil of their increase of fruits) as the *Aethiopians*, *Tagetenses*, *Parthians*, *Arabians*, *Lybians*, *Mellenses*, *Zemenses*, *Darienenses*, *Africans*, and those that live about *Lepris*, the *Azanaghi*, *Senegenses*, people of *Mauritania*, and others, live chiefly upon Locusts, and account their eggs to be dainties; others prepare them thus: First in a low large place they make a great smoak, by which the Locusts in flying are hindred and forced to fall; then when they have taken them they dry them with salt, the Sun and smoke, and cutting them in pieces, they keep them for their yearly provision, as we do fish, not only those which have large legs, but the *Attelabi*, the *Aselli*, *Asiraci*, and almost all kinds of Locusts, as we collect out of *Dioscorides*, *Strabo*, *Pliny*, *Solinus*, *Agatharhis*, *Plutarch*, *Avicenna*, *Posidonius*, *Leo* and *Dionysius Africanus*, *Alian*, *Diodorus Siculus*, *Aloysius*, *Cadmus*, *Agricola*, and the Centuries of Navigations, whence they were called *ἀνείδωτοι*, Locust-eaters. Yet though they accounted them amongst their choicest meats, yet the *Grecians* esteemed them but for meaner fare; if we beleve *Aristophanes* and *Plutarch* in *Sympos.* where he calls them the Sustainer of the Countreymans table: *S. Matthew* in the 3. chapter, saith that *John the Baptist* lived upon them and wilde honey; and God appointed four *Levit. 11.* sorts of them to be clean, and suffered the people of *Israel* to feed upon them: whosoever desireth more concerning Locusts for food, let them read the most learned Annotations of Venerable *Bede* upon *St. Matthew*. They have no venome in them; yet they that feed on them are not long lived, and seldome live to 40 years, and frequently die young, as *Diodorus Siculus*, *Agatharhis*, and *Strabo* have observed. *St. Ambrose* saith that Locusts hurt neither men nor fruits by themselves, but nourish them; and feed not on fruits unless God command them. But when God gives the word, they kill men, spoil the ground, and execute the vengeance of God. *Mantis*, as I said, shewes travellers their right way; *Ophiomachus* kills Serpents, all Locusts foreshew the Spring, and what is more acceptable to us? and if by so great multitudes they foretell of famine, by that they sweetly invite us to prayers and repentance; they live so lovingly together, that they stand in need of neither King nor Emperor; for they fly together as *Solomon* saith, *Prov. 30.* without a King and live in concord, whence is that saying of *Ecclesiastes*, *Thy keepers are as Locusts, and thy children as the young Locusts*: that is, not only numerous, but unanimous, and conspiring together.

What concerns their use in Physick, the Locusts are serving to that end also: for their smell Their use in cures the Strangury, especially of women. *Dioscorid.* Bread eat with the flesh of Locusts, is good Physick, for those who are troubled with the Stone: fried Locusts take away the roughness of the nails: Locust legs bruised with Goats tallow, cure the Leprosie. *Pliny.* *Mantes* cure hard scrofulous tumors.

mors. *Aselli* dried and drank with wine are excellent good against the stinging of the Scorpion. *Attelabi*, cure the stinging of Bees, Wasps, Hornets, and hurts by Blond-suckers. *Dioscorid.* *Eupor.* and *Pliny* 29. 4. *Arnoldus* prescribes this composition for the white skins of the eye for dimnests, and a cloud; *Breviarii lib.* 1. c. 16. Let the Locusts be not altogether greens, nor wholly black, thrust a string through them and strangle them in a little White-wine, then dry them in the shade, then take Primrose roots, and Fennel roots, dry and powder them, and mingle them with the powder of the Locusts, then keep the powders bound in a cloth, in the said White-wine in a brazen vessell; of which *apine* (the cloth being first gently crushed) drop two or three drops into the eyes: As for their quality and temperament; unsalted they heat a little, they inflate, increase seed, stir up venery, when they are salted it seems they are of worse juice, they cause thirst and burn the blood; yet they hurt not dropie persons, nor such as are leucophlegmatical. *Silvaticus.* Farther to touch upon other uses of them; Locusts, their feet and wings taken away, are good to feed young Peacocks. *Colamolla.* Frogs about lakes, and many fish feed on Locusts, which is so well known, that *Bellonius* witnesseth the same. Also the *Salencians* have a bird feeds on Locusts, as *Hesychius* remembers. Jackdaws do also devour them; wherefore at the publick charge they are maintained in *Thessalias*, *Illyrium*, and *Lemnos*; for they not only destroy Locusts coming, but they also devour their issue, whereby corn is preserved unhurt. Also they are food for Rooks, Choughs, Hens, Geese, Ducks, for Hogs also and sheep, as besides histories, and long experience, *Plutarch* witnesseth in his book of *Isis* and *Osiris*. Lastly, if any credit may be given to *Apomafaris*, a man most learned in the learning of the *Indians*, *Persians*, and *Egyptians*, to dream of the coming of Locusts is a sign of an Army coming against us, and so much as they shall seem to hurt or not hurt us, so shall the enemy.

How they may
be killed and
driven away.

Now it will be time to shew by what means the over great abundance of them may be driven away by the providence and wisdom of man, and so I shall conclude this Chapter. *Pliny* saith, that in the Countrey of *Cyrene*, it was ordered by a Law, that thrice in the year they should war against the Locusts. First, breaking their eggs, then destroying their young ones, then by killing the grown Locusts. If any failed of this duty they were punished for their default. The *Magnesi* and *Ephesians* march out in military order against them. It is no wonder that divers Nations took counsel how to destroy so cruel an Army, whereas in divers places of *Africa* and *Mauritania*, they are so numerous and mischievous, that they force the inhabitants to seek out new habitations. We observed out of *Pliny*, *Valeriolus* and *Pencernus*, divers waies to break and destroy their eggs. At the entring of the Spring, rivers are turned upon the places where their eggs are, so that they abundantly wet all the surface of the earth, or the greatest part of it. If the place be so situated that they cannot do this, multitudes of men trample over the ground, so that no place is left, that is either higher or deeper than the rest; if they cannot prevail with their feet, they use a drag, a harrow, and a rowle that are very heavy, such as Countrey men use, that they may the more easily bruise them, and level the ground the better. Also abundance of military Chariots would do no hurt here, for by frequent and often running up and down with the wheels, they would break the eggs: I should also commend the use of the plough, which would dig and turn up the earth, and cut the nests of the Locusts. Some counsel to fright the old Locusts with ringing Bells, sounding Trumpets, beating Drums, and by discharging great Guns, to make that terrible *Salmonian* noise, that may drive them away; some think that by great cries and shoutings of men, they may be terrified, as if the beating of the air might shake them, or as though they heard any of those terrible noises, as some absurdly dream. Others make deep ditches in the fields, and with crackers that beat the air, drive the fearful Locusts thither by degrees, and when they are come into these ditches, they are suddenly overwhelmed with earth, or casting in rubbish, they cover and destroy them. Some affirm that they are taken with pickle made with Locusts, that by it they fall suddenly into a deep sleep, and afterwards dye. By these acts, saith *Valeriolus*, the Locusts that vexed the people about *Arls* were destroyed in twenty daies time. In *Syria* they fight against them in a souldierly posture. In the Island *Lemnos*, all Souldiers are bound to bring a certain measure of Locusts to the Magistrates every day. Some Nations, as I said, feed Jackdaws at the publick cost, that as occasion is they may destroy the Locusts. Moreover the birds, namely Storks, are called *Seleucides*, which the inhabitants of the Mount *Cassian* formerly obtain'd to be sent by *Jupiter* against the Locusts that destroy'd their corn. These birds come yearly to help them, but whither they fly back, or whence they come, no man can tell. So soon as the Locusts are destroyed they forsake the Mountain, and go home again. Our new Authors mightily commend the smell of brimstone, and of gun-powder, and think they will kill Locusts by their smell; but if a cloud of Locusts or swarm come tumbling into a land, let all the inhabitants lie close in their houses, for if they see no man in their journey, they will readily pass over that countrey, or else they will easily remain in that place. But if they be come before it be observed, they will touch no herb nor corn, nor any thing that is sprinkled with the decoction of bitter Lupines, and wilde Cucumers, for they perish so soon as they touch them. It may be the decoction of the lesser Centory, Wormwood or Walnut leaves would do the same. Also they are said to passe from those places where bats are hanged aloft on the trees. Moreover, if you burn Locusts taken in pits, the same way as I said, that fume will either choak the rest that are near, or will make them fall down, that they may be easily taken with your hands, or they will dye of themselves, being afterwards weakened with the Sun. If you would defend vines from

from them, sow three grains of mustard-seed near the root, for they sprouting up afterwards, will by their sharp sent, kill all *Bruchii* and Locusts whatsoever that come near them; as the *Geoponicks* of *Cassius* and *Dionysius Uticensis* (not rightly ascribed to *Constantine* the Emperor) do persuade us. *Aristot.* 4. *hist.* 8. saith that Locusts are driven away with the fume of Brimstone, Harts-horn, or Storax. *Palladius* from the rules of *Democritus*, lib. 1. tit. 35. writes that Locusts will hurt neither corn nor trees, if many river or sea Crabs be put in an earthen vessel with water, and be covered and set in the Sun, that they may evaporate so for ten daies, then whatsoever you would have take no harm, sprinkle with that water every eight daies, till the corn be perfectly grown. *Arnoldus* saith that Locusts are driven away with the fume of Oxe or Cow-dung, or the smoke of the left horn: but why doth he superstitiously exclude the right horn? for reason and nature hold right to be better than left. The Magicians trust much to their trifling charms, whom *sith Pliny* hath lib. 37. cap. 9. charged with extreme madness, and vanity unspeakable, I shall say nothing to detain you with. *Peucerus*, lib. de *Divinat. gener.* writes, that the *Romans* when they knew not the true God, whensoever they saw swarms of Locusts, used fasting, sorrow, sacrifices, and all means to pacifie the angry gods, and afterwards they more carefully adored *Jupiter*, who drove them away. *Eudoxus* saith, that the oriental *Galatians*, upon such a tempest, come to the god of Birds, and desire him often to drive away the Locusts that swarm in their lands. This should admonish us Christians that are entred into the rites of the true God, and are instructed by the perfect light, that the sure way to drive from us hurtful Locusts is to call upon God by prayer joyned with true repentance and unfeigned piety, without which all our force and inventions will come to nought, nor will all our devices avail at all. For I highly approve of that saying, *For all remedies without Gods assistance are idle enterprises of men, but when God is pleased, and blesteth the means, then are they remedies indeed.*

CHAP. XVII.

Of Grasshoppers and Krickets.

OF all the Insects making a stridulous noise, the Grasshopper challengeth the chief place, and by great right too. For in the heat of the day he sends forth a most shrill and muscull sound, sustaining his life with dew without doing any harm to herb or trees. Amongst the Greeks he hath divers names, according to the diversity of Countreys, generally and by a common name he is called *τέλιξ*, by the *Eleans*, *βελανός*; by the *Sideri*, *ζέρας*; by the *Cretians*, (as *Bellonius* saith) *σάμφορον*; by the Countreymen of *Saidas*, *ἔρον*, because it lives by sucking out of the dew. They attribute also divers names and appellations unto it from its sex, age, bigness, and singing. For the female which doth not sing at all *Alian* calls *κικώτις*; *Stephanus*, *καλαμαία*, that sings not; *Eustathius* thinks it is not a Grasshopper, but another kinde of creature like it. So doth *Athenaus* f. 4. from *Speusippus*, ἡ κικώτις ζῷον θύσιον τέλιξ ἢ τρυγώνιον, like to a Grasshopper, or the Bird called a small Turtle. Indeed the words of *Lia* out of *Alexis* cited by *Athenaus* in his *Thraso*, give in a large testimony to the same, both that the *Cercopa* had a voice, and was of a divers kinde from the *Cicada* or Grasshopper (I never saw the female *Cercopa*, nor the Pye, nor the Nightingale, nor the Grasshoppers male) unless perhaps the Grecians were wont to keep together in their caves the male and female Turtle, so we should say they joyned together in like manner, the male Grasshopper and the female *Cercopa*; for that they did not only keep them together with the Pye and the Philomele, for their singing sake, but that they might behold their mutual embraces, dalliance and lustful pleasure. Add to this that *Athenaus* calleth it *λαλέτερον*, or the more talkative; so far is he from attributing all the business of singing and making a noise to her male, contrary to the custome of the female.

The Grasshopper when it comes to be old is called *τέλιξ*, when young and tender *κίκος* & *κίλλος*, as *Hesychius* observeth. The little Grasshoppers (which *Gaza* calleth *Cicadastras*, and we *Cicadulas*) the Greeks call *καλαμίδες* & *κικώτις*, which signification I wonder that it is passed over by *Stephanus*. The word *καλαμίδων*, put substantively, signifieth the least Grasshopper of all, as *Eustathius* witnesseth. *Τελιγόνια* also do signifie the lesser Grasshoppers, as we read in *Calius*, although *Eustathius* will have them to be creatures of another species, like to Grasshoppers, as elsewhere he calls them the females of Grasshoppers. These *Dionysius* will have so called of the Greek word *τέλιξ*, from the sound they make. The more vocal and obstreperous of them called *Enceladi*, are the *Achetai*, or the Males, making indeed a very pleasant and musical noise. The other being mute and more wilde are called *Sigalphi*, from their silence, as also *Acanthii*. In Arabick, *Gintole*, and *Cicuale*, *Vulderetriche* and *Robiche*. *Silvar.* *Cicara* is a barbarous word of a Latine or Spanish word corrupted. In Italian *Ligallo*, *Cicara*, and elsewhere *Lazenala*; In Spanish *Cignatregas*, and *Cigarre*; in Germany and England I do not hear that there are any Grasshoppers to be found, but if they be, they are in both Countreys called *Bow-krickets*, or *Baulm Krickets*; in Flanders, *Feildtreffen*; of the Walloons, (if I mistake not) *Straffen*; in Polonia, *Konick*, *Zymyco*, *Spiewa*. Sometimes the name Krickets and Grasshoppers, are promiscuously used, which cannot be, unless you will say that the Kricket is a Grasshopper without wings. The Latines as

some that hunt after words will have it derive the word *Cicada*, quasi cito cadens; (i. e.) quickly perishing. And that indeed is the Epithet that *Arist.* gives it, *ὀλιγογενὲς τήνδε*, the short lived Grasshopper, for so indeed it seems to be.

Of the Grasshoppers, some are more common, others more rare. The common and ordinary sort hath the head big, and bending downward; and is of the figure of a *Pentagon*, terminated with unequal sides; it is of a blackish green colour, having on each side two bunches or bosses of the same colour, but of an oval figure, and edged about with a dark coloured margine, and a line or streak of the same running along cuts the bosses in the midst, & the letter *ἰωτα* of a pure black colour

parts the head right in the middle; it hath eyes of somewhat a dark green, prominent and big, considering the bulk of the body; insomuch that I wonder that *Nigidius* (that denies that they have any eyes) could not see them. But indeed as *Aristotle* saith they are very dull sighted. For if you bend your finger and put it back toward their eyes, they will rather come towards you than go from you, and will the sooner get upon your hand being drawn thereto by the shadow of the finger: the head or rather the face looking upward, appears of a weak green from white.

The Grasshopper amongst the Insects, is the only one of those kinde of creatures that is without a mouth, but hath it otherwise supplied, by a long kinde of compact fast substance, which like a promucis supplieth the place of a mouth and tongue fashioned round and hollow like a pipe or gutter, reserved for the most part within, having ten streaks running athwart it, with the which it sucks the dew, the only nutriment that it hath, and which is peculiar unto it, as *Virgil* saith, *Pascuntur dum rore Cicada*: Whence it is in *Athenaus* that the question is controverted, afterward concluded, that water alone is able to maintain life, because with it alone the Grasshoppers are sustained. Hence it is that elsewhere he repeats the saying of a certain Parasite to this purpose

ὅτι οὐδὲ τῆς ἑσθῆς κοχλία, i. e. I am not such a one as liveth on dew nor herbs. And that of *Theocritus* is very like it: *Doth he live on dew like a Grasshopper?* Away then with that Fable of *Aesop* which is commonly received, that the Grasshoppers begged food from the Ants, for we may learn out of *Plato*, that the Grasshoppers are consecrated to *Apollo*, and the Mules bestowed on them this boon, that they should live only by singing, not so much as mentioning the dew. We shall also pass over those inventions of *Tzetzes* as not worth the mentioning, who reports that the Grasshoppers are alwaies provided with food in great variety. It is reported by *Antonius Altomarinus* in his Book *de Manna*, that the Grasshoppers do suck the juice out of the bark and leaves of the Ash-tree, or Elm chiefly, the which we call Manna, but yet it is more likely that they suck it off from herbs, or out of them, as the Butterflies do, both because they are alwaies found to be empty within, and for that they are not perceived to void any thing, unless it be when they have taken in a little more dew than ordinary, they cast out of their bodies the superfluity thereof, as the Countrey men have observed.

The body is fastned to the head by a very short neck, or rather none at all indeed, the shoulders are spotted with green and black, the breast is of a bright green well towards white, out of which come three feet and shanks on each side of a leek colour; the belly in the bigger sort is two fingers in length, and one in breadth; the inner part of the belly resembles a target ending in a sharp point, and is compassed about with an hem having twelve or thirteen joynts in it; within appear certain incifures of the same colour with the belly; the males (that is, the least of the two) have the end of their tail forked; the females on the other side whole; their back is blackish with seven or eight green lines or incifures drawn athwart the same; the wings very curious, of a silver colour, and painted with dusky spots and specks very trim, the outermost twice as long as the innermost, and more various: the dark brown is more rarely seen, which *Ludovicus Armacus* a very diligent Chirurgion, brought from *Guinea*, and gave to *Pennius*: also *Mr. White* a rare Painter, gave him another brought forth from *Virginie*, it was all of an ash-colour, (it may be it was that the Greeks call *τέφρω*) but it was like the former in proportion, it hath both its wings silver coloured, but not at all, spotted, and the former green ones were. Those that live in quicksets are most green and big, those that are found in oats, or corn, or grass, are of divers colours according to the place where they be, and are far lesse then the rest.

But if we compare their Nature and conditions with mans, they being our servants, do excell their Lords and Masters in virtue; and may teach us manners. For they shew forth that harmlesness of conversation, that they will not hurt or abuse any creature; but we perverting the right

right use of things, can finde in our hearts many times to abuse even our parents themselves. What guest will be content with the diet of the Grasshopper; that is simple, mean and frugal, not iniquated with variety of dishes, or cookery, or curious mixtures? yea so far hath foolish curiosity prevailed with men, that unless flesh of contrary nature, and with them fruits, leaves, spices, liquors, be dressed together, they think their appetite unsatisfied, & their palate very much wronged, nauseating that clean and wholesome diet of their forefathers. Those can quench their thirst with a little dew: we with our diversity of mixtures do rather invite and increase thirst than allay it. They living in shrubs near to the earth (in which they had rather sing) yet notwithstanding lead a cheerful life, and with their high strained notes, do make the lowness of their condition more easie to them. But we men if cast from any high place, we presently despair, and are afraid at every turn of the wheel of Fortune.

The Grasshoppers hold on singing from morning to night, without intermission, very pleasant and sweetly; whereas many Preachers neither preach well nor often, scarce four times throughout the year: truly they may be ashamed being bred more civilly, to be admonished of their duty by a wilde musician. These if you scratch or tickle their belly (as Poets which were commended) sing more shrill; but those speak them as fair as possible may be, yea invite them with gifts, yet (like the *Argonauta* of *Martial*) neither use the care, nor lift up their eyes or hands to the sayles. Moreover these agree all together in one tune, and bestow their mutual help in their affairs. But I would to God these did not wholly busie themselves in sowing strife, and breeding controversies, that they did not wrangle together about wool and flax, figures and forms, and ceremonies, and of things decent, undecently and unseemly. True is the proverb of *Theocritus* concerning them, *τίσις τίσις φίλος*, the Grasshoppers are a friend each to other; but man who ought to be a God to man, rather proves a wolf and a Devil, and putting off the nature of a man, tears up his own bowels.

Amongst the Grasshoppers the females are silent; the males do in a manner loath venery, neither are drawn unto it but by many enticements of the female. But our women have more tongue by far than men; and the men behave themselves more lasciviously than women. What is to be

added further. The Grasshoppers of all other Insects seem to be without passion, but the perturbations of our mindes do carry us on so headlong, that upon every slight cause, yea none at all, we wax hot with anger, pine away with grief, burn with envy and jealousy.

Now for the musick which the Grasshoppers make, amongst all the Insects there is none like it, accounted so sweet amongst the Ancients, that they equalled it to the sound of the Harp, as *Pollux* writeth, and it may be *Lucretius* therefore called Grasshoppers *Teretes*. When *Timon Sillographus* would commend the eloquence of *Plato*, he compared it to the musick of the Grasshoppers: his words are these: *Plato sings sweetly, and as well as the Grasshoppers*. They begin to sing in the heat of the day, even at what time the reapers would otherwise leave work, wherefore those laborious chanters get them up into trees, and there fill the ears of the labourers and passengers with their melodious noise. For as musick is a kinde refreshment and recreation to the fainting spirits and tired brain, so the unaffected notes and layes of the Grasshoppers; and the earnestness of their contention in singing, doth serve as a spur to provoke men to endure labour,

as the Cock is: whence it is that the *Locrian* Grasshoppers will not sing at *Rhegium*, nor theirs on the contrary near *Locris*; and yet there is but a small river runs between them, such a one as one may cast a stone over. Much certainly doth their Countrey (which comprehends in it all the love that may be) move them: where like the people of the Jewes, they refuse to sing their native Songs in a strange Countrey; who being cast out of their own habitation, seek means to die rather than waies to live; so prodigal seem they of their short life, and delirous after their native dwelling.

They do so affect the company of men, that unless they see fields full of Mowers or harvest folk, and the waies with passengers, they sing very low and seldome, or silently and to themselves. But if once they hear the reapers making merry, talking and singing, (which is commonly at noon) then they sing so loud as if they strove who should sing louder, together with them. Wherefore not undeservedly was the Paratite in *Athenaus* called *πῆσις*, who being naturally obstemious by nature, yet was so full of talk, as if he strove that no body should be heard at the table but he. *Socrates* in his *Phaedro* recites the History of the Grasshoppers very wittily, warning men not to sleep in the heat of the day, lest the Grasshoppers mock them: for the Poets report how their diligence was highly rewarded. For they say that the Grasshoppers before the Muses were, were men; who afterwards when the Muses came taught them to sing; but some of them were so delighted with musick and singing, that altogether neglecting their meat and drink inconsiderately, they perished; the which afterwards being turned into Grasshoppers, the Muses gave them that for a reward, that they should be able to live even in the heat of the day without meat or drink, neither to have any need of blood or moisture.

They couple and generate with creatures of the same kinde, as *Aristotle* tells us, and the male casts his seed into the female, which she accordingly receives; they bring forth in fallow grounds, hollowing it with that sharp picked hollow part of their tail, as the *Bruchus* doth, and therefore there is great plenty of Grasshoppers in the Countrey of *Cyrene*. Also in reeds, wherewith the vines are propped, they make hollow a place for their nest; and sometimes they breed in the stalk of the herb *Squilla*, but this brood soon falls to the ground.

This is also worth the notice, which *Hugo Solerius* writing upon *Aetius* affirmeth, that the Grasshoppers dye with bringing forth, the ventricle of the female being rent asunder in the birth (the which some being very much deceived therein, do report of the Viper) the which I exceedingly marvel at. For they lay white eggs, and do not bring forth a living creature (as the field mouse doth) unless it be by reason of weakness: of the egge comes a little worm, of that comes a creature like to the *Anrelia* of the Butterfly, which is called *Tettigometra*, (at what time they are very delicate meat to be eaten before the shell be broken) afterwards about the Solstices, in the night come forth of that matrix, the Grasshoppers, all black, hard, and somewhat big. When they are thus got out, those that are for the quicklets, betake themselves thither; those that live amongst the corn, go and sit upon that, at their departue they leave behinde them a little kinde of moisture; not long after they are able to take wing, and they begin to sing. That therefore which *Solerius* feigneth concerning the bursting of the womb of the mother, I should conceive to be understood of the matrixes.

A certain woman did bring up some young Grasshoppers, for her delight sake and to hear them sing; which became with young without the help of the male, if we may believe *Arist. 1. l. de hist. anim.* but since he hath told us that all the females of Grasshoppers are mute by nature, and this spontaneous impregnation is far from truth, either the woman deceived *Aristotle*, or he us.

There is another kinde of Generation of Grasshoppers, that we read of. For if clay be not dug up in due time, it will breed Grasshoppers, so saith *Paracelsus*, and before him *Hesychius*. For this cause *Plato* saith Grasshoppers were of old time men born of the earth, but by the favour of the Muses turned into that Musical sort of creatures, the Grasshoppers. Even at this day sustaining their lives with no other food than dew, and feeding themselves by continual singing they live. For this cause the *Athenians* were called *Tettigophori*, because they wore golden Grasshoppers for ornament in their hair, and for a token of their nobility and antiquity; as *Thucydides 1. Syngraph.* and *Heraclides Ponticus de prisca Atheniensibus testific.* *Erytheus* makes a proof of this custome, being born of the earth as they say, who first governed the Common-wealth of the *Athenians*, and they too in the judgement of *Plato*, the Natives were *αὐτόχθονες*, i. e. born of the earth. Afterwards it came to be a custome that none but an *Athenian*, or one born in the place might wear a Grasshopper in his hair: of this opinion is *Aristoph.* as also his *Scholias.*

Isidore saith that the Cuckow-spittle doth generate Grasshoppers, which is not true, but that it produceth small Locusts is manifest. *Lucretius* in his 4. Book, saith that the Grasshopper in the Summer doth shift his skin, according to this verse:

Cum veteres ponunt tunicas astate Cicada;

And for that reason he is called by *Hesychius*, *γυμνός*; *πῆσις*, i. e. the naked Grasshoppers or without a skin: whom I should not have believed unless I had the picture of the skin so cast off by me.

Before Copulation the Males are of the more delicate taste, afterwards the females, for that they

they have in them white eggs very pleasant to the palat. The *Parthians*, as *Pliny* writeth, and the rest of the eastern Nations feed upon them; not only for nutrition sake, but to open their veins, and to stir up their languishing appetite, as *Athenens* in his 4. Book, and *Natalis Comes* expressly affirm. Hence *Aristophanes* in his *Anagyrus* out of *Theocritus*, writes that the gods did feed upon Grasshoppers, at what time they had lost their appetite through choler or passion. I have seen, saith *Alian* l. 12. c. 6. those that sold them tyed in bundles together for men to eat, to wit, the most voracious of all living creatures did sell the most jejune, lest any thing should be lacking to their exquisite dainties.

Their use in
Physick.

Dioscorides gave roasted Grasshoppers to eat, and saith they are very good against the diseases of the bladder. Some, saith *Galen*, use dried Grasshoppers for the Colick; they give according to the number 3, 5, or 7 grains of Pepper, as well when it goes off as when it comes on. *Trallianus* bids to give them for the Stone, dried and beaten, the wings and feet first of all taken away, and this to be done in a bath with sweet Wine and Hippocras. *Egineta* useth them dried for the Stone in the reins, and for the diseases of the reins he invented the composition called *Diatettigon*. Such another like Antidote doth *Myrepsus* prescribe, but all heads and feet as superfluous members being cast away. *Luminaris* hath transcribed an Electuary out of *Nicolaus* of this sort. Take Grasshoppers, their heads and legs cast away, two ounces, Grommel seed, Saxifrage seed, each 1 ounce: Pepper, Galanga, Cinnamon, of each 2 drams, Lignum Aloes, half a dram; honey what is sufficient. *Nicolaus* useth Grasshoppers burned and powdered, mingled with honey, and gives them about the bigness of a bean in a quantity of wine. *Actius* gives three Grasshoppers beat in Wine. Some instead of Cantharides use Grasshoppers to provoke urine, and in my judgement not without very good reason; for they are taken with lesse danger, and do work sooner, as well in this disease, as in the weakness of venery. *Nonus* the Physician prescribes an Antidote of Grasshoppers, and *Xenophyllum*, against the Stone in the kidneys. *Aretaus* for the remedies of the bladder, speaks thus of Grasshoppers; *The best remedy for the bladder, is a Grasshopper given in its time to eat* (Males before copulation, but afterwards Females, as we finde in *Aristotle*) *but out of their time, dried and powdered; boyl them with water and a little spike: also let the patient sit in the same for a bath to ease the pains of the bladder.* Some of our later practitioners, put Grasshoppers in oyl, and set them in the Sun, and mingle them with oyl of Scorpions, and anoint the privities of men and women, the testicles and parts about with it for pains of the bladder. *Arnoldus*, *Breviar.* l. 1. c. 20. & 32. commends the powder of Grasshoppers for the Colick, and Iliack passion, and also to drive forth the Stone; if half a Grasshopper in powder be drank with Goats bloud, or Diuretick wine. *Laufamus* highly esteems the ashes of Grasshoppers to break the Stone, taken with Radish water, or the decoction of chich Pease. Also they cause idle and lazy boyes to hunt after them: *Theocritus* speaks thus of it in his first *Idyllium*.

Hee with thin ears of corn bound to a cane did make
A whip, for Grasshoppers to hunt and take.

Neither are they only excellent meat, and very usefull in Physick to men, but they feed Birds also, and insnare them. For the youth of *Crete* (as *Bellonius* witnesseth) hide a hook in the body of a Grasshopper, and when they have fastned it to a line, they cast it up into the air; which the Merops seeing, catch it and swalloweth; which when the boyes perceive they draw it to them; and so do exercise their air-fowling not without profit and pleasure.

The Grasshoppers abounding in the end of the Spring, do foretel a sickly year to come, not that they are the cause of putrefaction in themselves, but only shew plenty of putrid matter to be, when there is such store of them appear. Oftentimes their coming and singing doth portend the happy state of things: so *Theocritus*, *ἡ τήν γε ἀδὲ λαλῶντι*. *Niphus* saith that what year but few of them are to be seen, they presage dearth of victuals, and scarcity of all things else. But whereas *Jo. Langius* (a Philosopher of great reading and learning, and a famous Physician) saith *lib. 2. epist.* that Grasshoppers did eat the corn in *Germany* as the Locusts do; *Stamius*, that it was done in *Helvetia*: *Lycosthenes lib. prodig.* and the Greek Epigram doth affirm, that they eat the fruits and crop the herbs, truly (unless they mean a Locust in stead of a Grasshopper) they declare a strange thing, and (saying the credit of so famous men) I will not believe, for they have neither teeth nor excrement as hath been said, but only feed and swell with the dew. Besides, although I have gone over all *Helvetia*, *Germany* and *England*, and have searcht for a Grasshopper as for a needle, yet could I finde none. And therefore I suppose that both they themselves, as also *Guill. de Conchy*, and *Albert. Vincentius*, to have mistaken the Locust or *Bruchus* for the Grasshopper, being deceived by the common error, who take the one for the other. They that desire more of their nature and use, may consult the Authors of the Greek and Latine Epigrams, with praising them or dispraising them according to their own humour.

The *Egyptians* by a Grasshopper painted, understood a Priest and an holy man; the later makers of Hieroglyphicks, sometimes will have them to signifie Musicians, sometimes prattlers or talkative companions, but very fondly. How ever the matter be, the Grasshopper hath sung very well of her self in my judgement in this following Distich:

Sim

*Sim licet insecti genus exiguum atq; minutum,
Magna tamen parvis gratia rebus inest.*

Although I am an Insect very small,
Yet with great vertue am endow'd withall.

Next in order followeth the *Gryllus* or *Kricket*, both for that it resembleth it somewhat in shape, the wings excepted, but comes very near it in its note and manner of singing. *Calepine* saith it is called in Greek *γρύλλος*, but citeth not his author, neither can he. Others from the shrill sound think it to be so called, like the noise of the dashing of waves, which is called *Gryllismus*, in the number of whom is *Isidore*. *Hadrianus Junius* calleth it from the harshness of the sound *αχρη*, but not rightly; whereas I have proved out of *Arist.* that to be a greater sort of Locusts. *Freigius quest. lib.* from *Pliny*, calleth it *Tryxalis*; the which notwithstanding it be an Insect without wings as the other is, yet it is not at all like to the *Gryllus* in form or shape. It is called also in Latine *Gryllus*; in French, *un Gryllon*, *Crynon*; in Arabick, *Sarsir*, if we may believe *Bellunensis*; in Barbary, *Gerad*; of *Avicen*, *Algiedgied*; of the Polonians, *Swierc*; Hungarians, *Ofzifereg*; in Germany, *ein Gril*, *ein Heyme*; about Argentinum (from the moneth wherein it sings) *Brach vogle*; of the Illyrians, *Swietz*, *Czwiczick*; of the Italian and Spaniard, *Gryllo*; of the English, a *Kricket*; of the Dutch *Greken*, *Nachtecreket*.

The name of the Kricket,

The *Gryllus* or *Kricket* is of two sorts, the field *Kricket*, and the house *Kricket*. *Pliny* refers them both to the kindes of black Beetles, but improperly, since they have not their wings in a cover, but only thin membranes, though the outmost are far thicker than those that lie hid under them. *Calepine*, that came after him, makes it a kinde of Locust, but his error is the same. *Niphus* on *Aristotle*, *hist. 3. 28. & 29.* calls them ground Locusts and Bruches, as also

Albertus by ignorance calls them Grasshoppers. Of the field *Krickets*, some are males, some are females: the male is welnigh as big as the Grasshopper, but the body somewhat longer, of a blackish colour, the head for the bulk of the body, big; the eyes great, standing out, the fore-head horned, but the horns without joynts, which notwithstanding are moved to and fro with ease. It hath six feet coloured like the body, the hindmost longer than the rest, for the more nimbleness of motion and leaping; they go (as all the rest of the *Krickets* do) forward and backward; the wings as it were slightly engraven, and crooked, covering almost all the body, the tail forked, the body less than that of the female; she having a bigger belly, is of an unlightly green colour; the eyes grass-colour, the cornicles reddish, the tail three forked like a Trident, in bulk of body differing from the male. In the Summer they are found in the fields, making holes in the earth, and building their nests. In a calm Winter they lie hid, in a cold and sharp they die in their holes, the which they seem to have digged without the help of a Pioneer.

The noise which they make is caused by the rubbing of their wings one against the other, as *Pliny* witnesseth. *Jacob Garret* an industrious and ingenious Apothecary did the same with the wings pluckt off and rubbed together, very cunningly imitating them: insomuch that I wonder at *Scaliger*, who saith it cometh from a kinde of I know not what follicle and pipe placed in the hollow part of the belly; and at *Sabinus* who ascribeth it to the collision or grating together of their teeth: the which *Pliny* also, but falsely, writeth of the Locusts. When as either of them through the narrowness of the passages of their holes do lightly rub their wings, whether field *Kricket* or domestick, they make but a small sound: but when they are out of doors and rub hard, they make a very shrill loud noise, yet not at all without the motion and agitation of their wings: the which if you crop or pull off, you shall see all that noise presently to cease. In the heat of the day (in which they are much delighted) and in the night also they sing before their holes mouth.

Their common abode is in pastures and meadows; they do not willingly tarry in shady and opacous places, they seldome live till winter as *George Agricola* writeth.

Nigidius gives great credit to them, but the Magicians more; because they go backward and make a noise in the night, and make holes in the earth. The farther off they are, they make the shriller noise; whereas being near at hand they are silent, and through fear or suspicion presently betake themselves to their holes. The *Kricket*, (saith *Albertus* *l. 4. c. 7. exercit. 273.*) if it be divided in the middle, or have the head taken off, yet sings and lives a great while after. The which if it be true, what shall become of that pipe in the belly of them which *Scaliger* saith doth cause the sound? The children use to hunt them with a Pismire tyed about the middle with

with a hair, which they put into their hole, blowing away first of all the dust lest she should hide her self again, and so is drawn out by the Pismire. *Plin. l. 29. c. ult.* But sooner and with less labour is she taken thus, take a long small twig or a straw, and put it into the hole, and draw it out by little and little, out she comes presently to her holes mouth, as it were to ask what the matter is, or who offered that injury to her hole; and so is taken. From whence cometh the Proverb, *Stultior Gryllo, more silly than the Cricket*; of him that for every light cause doth betray himself to his enemy, and wittingly brings himself into danger. They live upon new Panick, ripe Wheat and Apples.

The house Cricket (if we may believe *Albertus*) is called of the Greeks *uaxxaxs*, but no such name can be found. It may be he took a barbarous word for a Greek: the English call them *house* *Kricket*s, the Germans, *Heimgrill*.

Pliny l. 11. c. 28. writing of the Scarabee (among which he falsely reckons the Cricket) hath these words: Some of them dig holes in the ground, others of them in the dry earth between the fire and the oven, making a great noise in the night. The Domestick like the former are both male and female. The male is almost all over of a dunish colour, the back of a various dun, or rather black; the body long and much less than the field Cricket; the head almost round, the eyes black, the cornicles movable every way, in form and shape all alike the field Cricket; about the root of the middle feet two snow white lines do cross the back and adorn it.

In the moneths of *July* and *August* they fly, but not far nor long; and that like the Wood-pecker, or Hickway, with a waving flight, sometimes flying aloft with her wings spread abroad, sometimes descending with her wings close to her body: the tail is forked. The female is the bigger and longer bellied, she flyeth with four wings, of which the outermost are shorter, the innermost narrower and longer; the end of the tail hath three prickles or bristles. Both the sexes fly, and leap and run, and that swiftly, they lick in greedily the scum of broth, and barm of ale or beer; they feed likewise on the matter and liquor that cometh out of corrupted flesh or carrion. Of this Insect writeth *Albertus* thus: The *Gryllus* or Cricket which sings in the night, seems to have no mouth as the field *Kricket*s have, but there is found in his

head a long thing like a tongue, and it growes above the outer part of the head, and that part is not cloven, as the mouthes of other creatures; neither is there found in the belly any superfluity at all, although it feed on the moisture of flesh and fat of broth, to which either powred out or reserved it runs in the night; yea although it feed on bread, yet is the belly alwaies lank and void of superfluity.

The Use.

The Cricket doth not only recreate men weary with labour, with their singing, but are good for physick also to drive away diseases. The Ancients (as *Scaliger* hath observed *Exercit. 186.* and found it by his own experience to be true) did use them in stead of the *Cantharides*, and with the like success. It being dug out of the earth with the earth with it, is good for the running of the ears. Being rubbed between the hands it cureth the disease called *St. Antonies fire*, as also the swelling of the jawes: but this Cricket must be digged out together with its earth with iron, and afterwards be rubbed; and so the patient will not only be cured for the present, but shall be free for a year from having the disease again, *Plin. l. 30. 4. 9. 12.* They cure also the *Parotides*, i.e. an Impostume or sore coming of matter distilled from the head into the kernels of the ears; whether they be bound upon the place, or the place anointed therewith; they serve also, together with their earth, to anoint the Kings-Evill. Their ashes mixt with oyl, bring old ulcers to Cicatrice. The Cricket diluted in water is good against the Stone or difficulty of urine. *Bellunen-sis* used to drop the oyl of them into the ears of them that are diseased in that part; by that means taking away all the dolour and pulsation of them. *Marcellus* much commends the stroking of them upon the tumours of the jawes, and binding them upon the same: and in the opinion of *Haly* being hung about the neck, they cure the *Quartan Ague*. *Serenus* saith they cure the swelling of the Tonsils in this Distich:

*A Cricket with right hand on Tonsils prest,
To kill the Cricket, gives the patient rest.*

Children (as the *Italians* do *Grashoppers*) do keep them in a box bored full of holes, or bags, to hear them sing in the night, giving them leaves of herbs whereon to feed, and so keep them all the Summer. They are kept in *Africk* in iron cages, and are sold at a great rate, as I have heard by some Merchants, to cause sleep. For those of the inhabitants of *Fesse* are exceedingly delighted with their shrill noise; as much as the *Irish* and *Welch* with the sound of the Harp. With which also learned *Scaliger* seems to be not a little affected, when for their musick sake he kept them inclosed in a box, the which if he had kept in such a thing where they might have had air, he had not found dead after three daies, but able to live a long while: *lib. de plant.* For being secluded from the air they cannot live, which besides air and sound have nothing in them, nor seem

to be any thing else. The last Summer I had a male and a female of them; but within eight daies, I found the sides of the female eaten out by the male, which also it self two daies after expired.

The Bird *Lanio*, as the learned *Brewer* hath observed, is fed with them. The which she fastens upon thorns near to her nest of young, for fear they should want food.

When they become offensive by reason of their number, thus they may be driven away or taken off. Take a good deep dish filled of water, and place it before their holes mouth with a good deal of oatmeal round about it; so the *Krickets* leaping up into the bowl are drowned: or if you mix water with *Vitriol* and inject it into their hole, they will be gone.

There is one little winged creature behind, which whether it may be referred to the Classis of *Grashoppers* or *Locusts* I know not. For by that it flies in swarms, and eats the corn, it may seem to be a *Locust*; but in figure and shape it is likest the *Grashopper* above any thing. The visage of this creature is wonderful resembling an *Infants*; it hath on the head a three cornered cap, in the top of which are four black foots; two often very long, the other two almost round, between which you may perceive two very little points or pricks; it hath four wings, of which the innermost are folded double when it sits still that you would think it to have six wings. And these it may be were those *Locusts* of which *Cuspiannus* hath written out of *Sigebertus*. In the moneth of *August* (saith he) in the year 874. a wonderful swarm of *Locusts* having six wings, and six feet, did fly out of the East, by which almost all *France* was destroyed. You would say at first sight they had a hood upon their shoulders; but if you look nearer hand, it is nothing but the upper part of the wings inclosed with a semicircle. The body very thick, of a black and dun colour, the hinder part of the wings were all full of black spots. *P. Quickelbergius* of the City of *Antwerp*, sent over this to *Pennius* out of *Africk*, the which I keep to this day in my storehouse of *Insects*, by the name of a young *Grashopper*. And as little am I satisfied concerning the *Tryxalis* (spoken of before) it had its name it may be from gnawing or eating. But that it should be either the *Bruchus*, or the little *Herb-locust*, *Grashopper*, or *Kricket*, I cannot be induced to believe. Not only because *Athenaus*, *Pliny*, and other *Philosophers* are not agreed in that very point; but besides, because they do much differ in form and nature; and why I pray may not *Tryxalis* be derived from *τρυζα*, to make a noise? and if it be, truly it will best agree with the *Krickets*, which because of the noise it makes, it may be as true of the *Cricket*, which *Peucer* very well distinguisheth from the *Blatta* or *Beetle*, as by other things, so by the noise it makes: that which *Joach. Camerarius*, son of that great *Camerarius*

us and heir of his vertues, first observed, *Pliny* adviseth to roast 20 of them and to drink them with sweet wine against shortness of breath, and spitting of blood. The ashes of them in honey, applyed to the rugged edges of ulcers takes them down; they are likewise exceeding good for the stopping of womens courses or monethly purgations.

Hitherto I thought good also to refer the water *Grashopper* of *Rondeletius*, whose head is like a pentangle, having as it were five corners, the eyes round and standing out of the head, not great, but black; the cornicles very short, coming forth out of the outermost part of the mouth; on each side it hath three feet, the hindermost longer than the rest; on the back it hath little wings, or some coming; the tail forked, the belly oftentimes as it were cleft; the colour of the body somewhat dun, or rather black and white. I found them in muddy and standing waters, but the nature of it I yet know not. This differs from the land *Grashopper*, both for that the head stands out more, and it seems to have some kinde of neck, and also it hath wings not fit for flight, but only to lift it self up. This is said to make a kinde of a pleasant noise like the land *Grashopper*, upon the

leaves of the water Lilly, pond-weed, and other water herbs. The which I have not as yet heard.

CHAP. XVIII.

Of Moths called *Blatta*.

Most men talk much of the *Blatta*, but few or none able to describe what the *Blatta*, properly so called, are, neither do they give the least mark whereby they may be known; but gathering divers notions here and there do put them all together and confound them. And but that *Pliny* had brought some light to this History, the *Blatta* had altogether been omitted or lost. First of all therefore we shall shew to what *Insects* the name of *Blatta* was given according to Authors, then we shall set down what the true *Blatta* and properly so called is. Now under the name of *Blatta* are comprehended both the worms growing in the ears, as also those *Phalene* which

which trouble the Hives of Bees. But since these desire the light, the other altogether shun it, why they should be accounted Phalens, I do not see. The Blatta also is a little worm eating cloathes or books. So Horace in his Sermons, *Blattarum & tinearum epula &c.* But Martial altogether distinguisheth between the *Blatta* and the *Tinea*, and sheweth them to be creatures of several kinds.

It is taken also of the Moderns for the little worm called *σῆψ*, out of whose web silken garments are made. Some call the little worm that groweth in the grain in the low oake, *Blatta*, from whence cometh the Blattean colour, or grain colour. So Turneb. *advers. l. 18. c. 17. & l. 28. c. 23.* The Blattean colour is died with worms which come out of the grain of Cockle, out of whose blood is produced a most curious colour, not black, as some think, but a bright purple or scarlet. To which the Book *de natura rerum*, & Gualter de Conchis do assent. The worms of the belly some call *Blattæ*. Cardanus in one place calleth the worms that breed in meal or bran, *Blattæ*. Gaza interprets the word *σῆψ*, as also *σφαλισκιδας*, *Blatta*. But the proper and right name thereof is *σῆψ*; according to Pollux, *πῆψ*; as also according to Lucian, deriding a man that was no Scholar, yet bought many books. The Italians call it *Blatta*, and *Tarma*; the Hertrurians *Piattela*; the Germans, *Wibell*, *Brottworme*, *Brottkarfaer*, *Malkaefær*, *Springwibell*; they of Norimberg call one species of them by way of sport, *Schavahen*, because it cannot endure cold, as Cordus writeth; the Illyrians, *Swinie*; the Polonians, *Molulomy*; the Hungarians, *Moly*; the Spaniards, *Ropa cova potilla*. Now the *Blatta* is an Insect flying in the night, like to a Beetle, but wanteth the sheath wings.

The Name.

There are three sorts of *Blattæ*; the soft Moth, the mill Moth, and the unfavoury or stinking Moth. *Freigius* divides them altogether falsely, confounding the soft and the stinking Moths one with the other, and making the *σφαλισκιδας* to be the third species of them, seduced as it seemeth by Gaza's interpretation. That all of them when they are old do shift their skin; both *Arist. hist. 8. c. 17.* and *Pliny l. 11. c. 27.* do affirm. All the males are supposed to have wings, but the females certainly have none; they also are less, those more bulky and big-bellied. All of them (but the stinking) run very swiftly, and die with cold. The male is soft, the female of colour more black, it hath a small head, whereout come two long cornicles, every waies movable; the breast, together with the shoulders orbicular; in the body it hath seven incisures; the wings are of the same colour with the body, it seldom flies, but (as the Ostrich doth) by help of the wings it doth run very swiftly; it hath a forked tail like a pair of Barbers cizzers; it hath six feet. It lives about Privies or Jakes houses, ditches and steamy foggy places, for the most part they are somewhat like the field Cricket, but of a more compact body, and with far more slender thanks.

In the Ship called the *Philip*, (which that noble other Neptune, Sir Francis Drake, took laden with spices) there was found a wonderful company of winged Moths, but somewhat bigger than ours, softer and of a more swarthy colour. I have heard by many men of good credit, that there was one of these soft Moths found and taken in the top of the roof of the Church at *Peterborough*, six times greater than the common Moth, which did not only pierce the skin of those that sought to catch it, but bit so deep, that it did fetch blood in great quantity; it was about a great thumbs breadth in bigness and length, and being shut in between two wals, yet after two or three daies got forth no man knew how.

The Mill or Bake-house Moth, I have seen: the Greeks call the female (if I am not deceived, because it had no wings) *μυλοκίς*, *μυλική*, *μυλαεῖς* & *ἀφροκοπίαν*: it is longer, thicker, and of a more shining black colour than the ordinary soft Moth, with a little forked mouth placed as it were under its belly; the cornicles like to the first, little hollow eyes, or rather eye-holes; the breast four-square, with the four foremost feet fastened to it, the hindmost to the belly; above the shoulders appear as it were little wings, though they are not so indeed; the rest of the body somewhat thick, cut all over round about, circle or orbicular wise; in the sides resembling the form of a saw, the tip of the tail and a fork growing on each side is somewhat like a Trident: these Moth Crickets take up their abode in warm places, as stoves and bake-houses, and such like; let them be never so hungry, they will scarce indure to come into the light; or if they be compelled so to do whereby to get some food, they betake themselves into the dark again with what speed they can, or else hide themselves in dust that they may not be found.

The third sort is so unfavoury, and carries with it such a stinking smell, that from the same it is called of the Greeks *σῆψ βλάτα*, & *βλάτα*; of the Latines, *Fatida Blatta*, i. e. the stinking

stinking Moth; it hath thighs sharp with prickles, as *Pliny* describeth it, the which mark of distinction, if he had not expressed, perhaps this kinde of Kricket had not been known, or seen by me. For the black Beetles (especially the hairy ones) they are altogether of the same form, only the tail taken off. It is of a pure black glistening colour, very slow paced, as no creature the like; the body so framed and ordered, that you would swear it were winged and had

sheath wings, nevertheless none of them have any wings, no not the male it self amongst this sort of them, (what ever *Pliny* dreameth to the contrary) it hath thin slender long shanks; remains in deep cellars, and is a retainer to the Jakes; it creeps very slowly, but at the least glimpse of light, and whisper of talk, she hides her self; a shamefaced creature certainly, and most impatient of light, not so much for its ill favouredness, but the guiltiness of its conscience in regard of the stink it leaves behinde it, and of its ill behaviour: for it frequents base places, and digs through other mens wals, and doth not only annoy those that stand near it, but offends all the place thereabouts with its filthy favour. The mouth of it is forked, the back covered (as it were) with a sheath wing, so solitary a creature that you shall scarce finde

two of them together. Whether it be begotten of putrefaction, or otherwise generated by the commission of male and female, is not certainly known.

About *Francford* near the River *Main* they are frequently seen, as also in *London* in Wine-cellars, and dark dungeons; the other species are more frequent in Bake-houles, and warm places. The stinking Beetle some confound with the *Cimex* or *Wall-louse*, a creature of the like quality; but not rightly. The inhabitants of *Pern* have certain creatures which they call *Araners*: *Serius* thinks them to be Butterflies. They are of the bigness of the Kricket, they go forth a great many of them together in the night time, and all that is in the house almost that is soft they nibble about and eat it. *Lib. Navig.* Butterflies I cannot say they are, because they gnaw; and do not suck with their *Promuscis*; I would therefore either make them to be Krickets, or some new kinde of Moth, or some creature mixt and made of both. In an Epistle of a certain learned man sent to *Gesner*, there is a description of another kind of stinking Moth. There is saith he a certain stinking flying Insect in *Hungary* that stinks beyond measure; I should call it a stinking Grasshopper, but that it is more like the Kricket. In Winter it desires the light, in Summer it shuns it; when it flies it makes a kinde of a terrible horrid noise, leaving a most noisome stink behinde it. Some there are when the air is infected, carry this creature about them as some secret remedy, and adore it; nay some of them, which a hog would scarce do, will swallow them, so afraid are they of the Plague, and so desirous to use means against it. They are bred in wals: where they are most frequent there grow as they say the most generous wines, & I have found it to be true by experience. *So far Epistle.*

All the younger Moths are whitish, but at their full growth of a bright red or tawny. The stinking are as black as a coal.

Divers Authors do speak of four other sorts of Moths, viz. the Venereal, bred in the genitals of men; the Bee Moth, the Cloth Moth, and the Library or Book Moth, from eating of the Books; but none of these, but the Bee Moth agreeth with the description of the Moth; but that neither is so stinking as the one called *Bleau*, or so soft as the others before described; but of a middle nature, rather pouldred with meal than anointed with oyl. Of the rest of these we shall speak more fully when we come to speak, God willing, of the Lice and Moths called *Tinea*.

Much variety of opinion there is among the learned of the colour of the Blat Moth, or the Blattean colour. For if these Insects (of which we have now treated) are the *Blatta* truly so called, why should not the black be the Blat colour, rather than red purple colours? Certain it is, it is that the *Bizantine* *Blatta* yeelds a purple colour, as that of the worm *Cochineal* doth a red or scarlet; either therefore all colours may be called Blattean, or else this last of ours is not one. Indeed I wonder at the boldness of *Turnebus* and *Thylessius*, which will have that of the worms to be the Blattean, when as they are of no Author called *Blatta*; but rather properly it ought to be counted a Scarlet red. The Blattean colour therefore, to say the truth, is the Purple, notwithstanding our *Blatta* send forth no such kinde of liquor; but are fliers of the light, nasty, cruel, rough, theiving, living of nocturnal depredations after an infamous manner, whence *Servius* calls them *Piratas noctu navigantes*, night Pirats.

These little creatures, although they are hateful to nature it self, to Men and Bees, yet God hath endued them with sundry vertues, in which they excell the *Blatta* *Bizantine*. For take off his shell or nail, which is there between its head (called *papaver*) and its neck, what doth the belly contain but the ornament to dye withall, and to delight the eyes with their colour? And be it so that Princes and great men will buy it though never so dear, and by the greatness of the price make it only fit for Kings to wear; yet notwithstanding when you have heard the virtue of these *Blatta*, otherwise so contemptible, you will say they are far more to be esteemed than purple. For they are wonderful good for the pains in the ears, taken after this manner: Take twelve Blats with their wings cropt off, of old wine and honey ana $\frac{3}{4}$, and half the rind of a Pomegranate, of the juice of an Apple 6 spoonfuls, boyl them well in a new pipkin till the rind of the Pomegranate be made limber and soft; then beat them all together, which done, add unguentum *Syriacum* $\frac{3}{4}$ i. of Tarre $\frac{3}{4}$ i. the juice of 4 Onions pressed out what may suffice; beat all these together and lay them by for use: let this decoction be dropt into the ears, and a lock of

new shorn wool stopp'd in warm. *Galen. sec. loc. l. 3.* Experience witnesseth that the soft Blats boyled in oyl and put upon Warts, are to good effect. The mill Blat, the head being taken off and the body bruised, doth cure the Leprosie, as *Masa* and *Pithen* have left in their *Receipts*. The fat of the stinking Blat, when the head is off, beaten with oyl of Roses, *Galen* out of *Archigenes* saith is very good for the ears; but the wool in which they put it, must by and by be taken out: for that fat substance will quickly breed worms. Others write that two or three of them boyled in oyl, bruised and put into a little linnen bag and applyed, are very good for the same purpose; their entrails beaten with oyl or warm water are likewise good for the same, being dropped into the ears. *Pliny* saith, *l. 2. c. 36.* that from the two first the heads must be pulled off before they be used in medicine; from the stinking, the feet and wings, or rather that crust or shell like wings on the back, that being more hard, and more poysonous; but it hath no wings. The stinking *Blatta* moreover mingled with oyl or pitch, are said to cure Ulcers, otherwise incurable; as also Wenns and Swellings in the neck, Botches, being layed on for 21. daies together: they cure also the Scab and Follons, bruised and festered Sores, the wings and feet being first taken off. We disdain to hear of these things, yet truly *Diodorus* (as *Pliny* saith) reports that they have helped the Kings-evill, and difficulty of breathing, mixed with Roan and Honey: the moist leaved thought fit to keep the ashes of them in a horn box for this purpose, or the powder of them to put into the body by way of Clyster. *Cardan* saith they take away pains; but what pains, or what kinde of *Blatta* should do it, he tels us not. The *Phrygians* and *Lycanians*, anoint those with them that have a stoppage in the Matrix. *Pliny l. 30. c. ult.* Last of all they may serve in stead of Castoreum for an *Antiballomenon*; and *Galen* useth them in stead of the *Buprestis*.

Remedies against them.

Now if you would have a remedy against themselves, cast but a handfull of Flea-bane (the Greeks *Mascula* is the Latines *Cunilago*) and all the Blats will gather together to it. So called in Rome *Blattaria* or the Blat-herb. Nature hath provided a remedy against them for the Swallowes; they are wont commonly to spoyle the Swallowes eggs, wherefore they use to fence their young with Parsly or Smallage, whereby the Moths are forced away from their nests. The which might be thought to be the figment of *Alian*, but that *Zoroastes* in his *Geoponicks* doth affirm the same. The *Upapa* or Houpe inclose their nests with earth flax against Moths. The Chough useth the herb Vervin to the same purpose. If they be anointed with the oyl of Spike, it works the like effect, as *Joach. Camer.* reports. That they may be rid out of Gardens, let us hear *Diophanes* his advice; Get the Guts of a Ram fresh killed and full of dung, bury it in the earth where many Moths use, and cast the ground lightly upon it; two daies after all the Blats will gather to it; the which at your pleasure you may carry other where, or bury them deep enough in the place, that they shall not be able to rise again. If you would preserve your Bees from them, use sharp fumigations, or set lights near to the Hives, or else anoint the props whereon they stand, that they may not get up.

CHAP. XIX.

Of the Buprestis or Burncove, and the Cantharides.

Many of the Naturall Philosophers have made mention of the *Buprestis*, but so little, that they seem neither to have touched either their form, or qualities, no nor so much as their true Name. For *Ardoynus* calls it *Buprestis*; *Vigelius, veter. l. 3. c. 15.* calls it *Vulpester* or *Bulpester*; and in the 78. chap. *Bustrepis* most corruptly. *Silvaricus*, if any other chief at Barbarism, calls it *Bustasaris*, *Bublistes*, *Bubestis*, so corrupted was the Latine tongue in these blinde times, that Barbarism had wrought a general confusion in all places.

Now the true name of it is in Greek, *βύπρεστις*, *παρα τὸ βύπρεστις τὰς βύς*, quia boves rumpit, because it swells Oxen; *Nicander in Alex.* derives it *ab incendendis bobus*, from burning or enflaming the bowels of beasts: *ἢ καὶ πρὸς δαυδάς ἐκείνους ἀδολοῦ μὲνους*, &c.

When cowes or calves are sick, and bellies swell,
They ave eat Buprestis keepers know full well.

For first of all by their acrimony they enflame the belly of cattle, upon which followes a tumor, and a fever, and a kinde of a hot tympany, by which in the end the bowels are burst. By other, as by *Hesychius* in like manner *βύπρεστις*, καὶ βύβρεστις, which is more rightly ascribed to that kinde of red little Spider, found in pasture grounds, which doth use to bite them. In English it is called a *Blain-worm*, or *Trings*, which being eaten by cattel doth produce the like symptoms: the Latines retain the Greek name of *Buprestis*; of the Germans it is called *Gench*, *Gach*, *Knoelster*, *Gualster*, *die Grunen*, *Stinckhenden*, *Wildenmentde*, *Renkaefer*; of those of Heidelberg, from its swift running, *ein Holtzbuck*; in Italian, *Buprestis*; in Spanish, *Arebenta busi*, if *Mathiolus* say true. But I for my part, somewhat boldly, though not improperly, do adventure to call it by a new name in English, *Burncow*, or *Burstcow*.

Pennius reports that he light upon one about *Heidelberg*, and a true one indeed, who describes it thus: It appears, saith he, both in shape and quality to be a kinde of *Cantharides*, both for its force and properties, (if *Galene*, *Egyneta*, *Phavorinus*, *Aetius*, *Plinius* and *Avicen* are to be believed) but of a longer body, the outer sheath wings of a yellowish green, or rather of a golden

yellow; the thighs also are longer and thicker, the eyes globous, and prominent, out of the forehead, near the eyes come forth two long horns, joyned; the head smal; the mouth is wide, hard, strong, forked, having teeth with which he doth cruelly wound and bite; the belly not round, but very long; a great foe to the Beetle and the Lizard, aiming at their bellies (as being the softer and more penetrable part) which presently she gnawes through, and when she fears to be overcome or caught, presently she retreats and hides herself: somewhat strong of taste (as *Actuarius* saith) upon the palat. *Aetius* makes it to have a smatch of Nitre both in taste and smell. *Cornarius*, *Lonicerus*, and *Cordus* being deceived by the strong smell of it, could not forbear to say it was the same with the *Cimex* or noisome Wood-pews, and called it accordingly *Knolster*, and *Quelster*. It feedeth on flies, cankers, worms, and other the like Insects, provided she kill them in fight, for those that dye of themselves or are kill'd by others, she will not touch; when she hath filled her self with the carcases of the slain, what she leaves she drawes into her hole, and when she is hungry again feeds on them. Other savage qualities of this little creature let *Peter Turner*, and *William Brewer* (Physicians for learning and integrity of conversation second to none) relate, who together with *Pennius* at *Heidelberg* did observe its life and manners. *Bellonius* in his description of Mount *Athos*, expresseth the true *Buprestis* thus: It is (saith he) a little winged flying creature of a most strong sent like to the *Cantharides*, but greater, of colour yellow

or clay coloured; of such exquisite poyson, that the cattle when they have fed there a little while, do die of the grasse infected with its contagion. It hath its abode amongst the herbs called *Succory*, *Flea-bane*, *Nettle*, called *Vouprissis* by the inhabitants of Mount *Athos*. Thus far *Bellonius*. From whence we may truly collect that both descriptions of them do agree, as concerning their ill savour, their bigness, qualities; only they differ a little in kinde and colour. For we have not seen any of them yellow, unless I may call a greenish gold colour yellow. Neither indeed is it fit to stand so much upon the outward shape or colour; but admit that according to the diversity of the climate, they may both receive some alteration (as it is in men) and yet be the same in species. Another *Buprestis* of the right sort I have seen, the body a little shorter, and broader about the belly, the tail more piked, the head small, the eyes standing out, the mouth gaping, and forked, the sheath wing for the length of it, chamfered; of a full bright grasse and gold colour; the legs but six in number, long, proportionable to the body. The Prints of *Mathiolus* and *Grevinus*, beyond the nature of the thing, and the experience of their own eyes, expresse eight but more slender, (considering the bigness of its body, than the first sort of *Buprestis*) and blackish, the cornicles also but half so big, and smaller; it equals the first in swiftness of pace, goeth beyond it in noysomeness of savour, yea in this it excels the *Cimex* or stinking wood-lowe her self, and all wilde creatures. It hunts after Flies and Canker-worms, wherewith it is fed; so vehement strong it is, that it will kill the most deadly Spider that may be. *Pliny* saith, that in *Italy* this creature is seldome found, but now (as we have reason to believe *Marcellus Virgilius*) they are more common than the state of the countrey can well bear.

But that they are indeed venomous by nature, and very noxious to man and beast, as *Aetius* witnesseth (for they kill both by their whole substance) doth appear even by this; that those which

should give them to any one to drink, were as *Budens* saith in his *Pandects*, to suffer death. For so the Law runneth: *Qui Buprestem, vel ptyocampen, tanti facinoris conscii, aut mortiferi quid veneni ad necem accelerandam dederit; judicio capitali, & poena Legis Cornelia afficiator.* Whosoever shall give a *Buprestis* or a *Pine-tree Worm* to drink, to kill any body, or any mortal poyson, being found guilty of such wickedness, shall suffer death by the Law of *Cornelius*. I have seen about *Heidelberg* two *Buprestes* like *Scarabees*, the one of a golden green, the other of yellowish black. The one like to the former which we have described, but somewhat bigger; the outer wings all over streaked with golden lines, and shadowed with a little green; between the lines rise up bosses curiously wrought; very swift of pace according to the common nature of that Insect. But that which is of a yellowish black was sent unto me from *Vienna* by *Jacobus Quicquibergius* of *Antwerp*, who hath been a great help to me to enrich this history. The colour excepted, and that it was a little bigger, and had four horns, it altogether resembled the last we described.

The Use.

Although these Insects are such as hath been said, that they fret with their acrimony; that fretting they enflame, and with their poysonous inflammation cause extreme thirst, and a horrible swelling, insomuch that the very skin is burst; yet hath Dame Nature made them notwithstanding very wholesome, which Art afterwards hath prepared for medicine, before they be put in use. *Plinius* and *Agineta* dispute whether they should not be prepared as the *Cantharides*. *Dioscorides* dries them in a sieve over hot embers, and so layeth them by. *Galen* steeps them in vinegar. *Hippocrates* commands to take off their wings and feet. And because they fret, exulcerate, inflame and swell up, and do strongly attract and heat the parts so fretted. *Diosc. l. 2. c. 59.* saith, that being mixt advisedly with fitting ingredients, they may be applied to the Leprosie, Cancer, and wilde Tettors. My opinion is, that they may be used in stead of the bigger sort of *Cantharides*, rather than some kinde of *Blatta* (by *Paulus* his leave, if I may say so) not only because they are somewhat like in shape and figure, and in virtue also, as *Galen* writeth. *Pliny* saith that the *Buprestis* by way of corrosive doth take away Ringworms in the face. *Hippocrates* doth much commend them in divers diseases of the womb. For so he writeth in his Book of the Nature of Women; and in his Book of the Diseases of Women; and in his Book of Barrenness. For the hardness of the womb, to emollient juices and fat add a *Buprestis*, and use it. To drive out the Monethly Flowers and secondines, prepare half the body of a *Buprestis* (whether great or small) with twice as much pulp of a Fig, and apply it; for it purgeth the womb, and inflateth it, and is a special remedy to procure the Flowers when they are past hope. Sometimes he applies only a *Buprestis* (if it be a great one) sometimes making a soft pessary, he takes ten, and adds to them a little sawcer of oyl, and mingles with it Wine, *Arbipian* Cumin, *Seseli*, and Anniseed, of each alike parts, and whilst they are hot he makes a pessary of them and useth them to the Matrix. In the strangling of the womb, when the fit is over, the body first purged, *Hippocrates* makes a Medicament with a *Buprestis*, and thrusts it into the Matrix. Also for a Schirrous of the womb he useth a *Buprestis*, but warily and with diligent consideration; for he puts it in like a Suppository for one day, and when it doth much vex the patient by corroding, he bids to take it forth: moreover he compounds a *Buprestis*, Myrrhe, and Elaterium, and puts it in. So he doth also to bring forth a Mola, *Gal. l. 1. c. 1. 2. cap. 1.* out of *Archigenes*, describes a Medicament of *Buprestes*, with Vinegar, Crowfoot, and Wakerobin root, against falling of the hair, Leprosie, Elephantiasis, &c. the cure whereof you may easily finde there.

The signs of a
Buprestis be-
ing drank.

Now as I have declared hitherto its profitable qualities, so (lest I should transgress the bounds of history) I shall open the terrible effects that this poysonous creature causeth in man and beast; if a man swallow a *Buprestis*, 'tis all one as if it had been a *Cantharides*: the body swelleth, as if it had a tympany, much wind creeps between the skin and flesh, which hapneth no doubt by the flux of humours melted by the poison, and the vapours elevated upwards. The lips are of a strong colour, to wit, of a dead violet. In the mouth there is the like poysonous taste; the stomach, belly, and guts do ake extremely, the urine is stopt, the body is ill all over, as also the head and brain are sensible of it.

The Remedy.

A remedy of this is Salt-peter, taken in Wine and Oxe gall. Useful to that purpose is womans milk, suckt out abundantly, and in defect, cowes, goats, or sheeps milk. Womans urine drank, and vomited up again; but before a vomit they ought not be given, because by that means the Feaver would be more sharp. *Dioscor.* First of all therefore of good store of Wine sodden, or with oyl of Myrtle Bacon lard, or fat Pork broth, or with good store oyl of Olive, or boyled Wine a Vomit is to be made. New Wine drank freely, is held to be a special remedy against the *Buprestis*. *Galen* and *Ardoynus*. *Pliny* commends Nitre with water, or Laserwort, *Afa dulcis*, Wine and Honey, or Bezoin dissolved in warm water; or take red Nitre 4. drams, and in warm water or Posca cause Vomit. After vomit there must be means used for purgation, afterwards use dry Figs (as *Galen* prescribeth) or a decoction of them in old generose Wine when the fit begins to bate. The Thebane date is prescribed to eat alone, or bruised in sweet Wine or womans Milk: all kinde of Pears, and oyl of blossomes of Apples, are much commended for this use. *Nisander* commends wood-pears, (for that I think he means by *αχινάδα*;) and especially Myrtle berries) following the authority of *Dioscorides*. For that they do refrigerate and bind, and by that means do assuage the hot nature of the *Buprestis*, and help the weakness of the stomach. But heed must be taken they be not eaten while the body is yet swoln, lest the disease be increased by the poyson being kept in. Some with good reason give 31. berries of bladder Nightshade, and with Almonds the make Almond-milk, together with the decoction of Lettice, Violets, Borage, Bugloss, garden Nightshade, Plantain, Raisins, and the great cold Seeds. *Actius* gives the root of Scorpion-grass in sweet Wine to drink. Many extoll the wings and feet of the *Cantharides* for an Antidote against the *Buprestis*, but either it hath an opposite quality by antipathy, which makes good that opinion, or else we may suspect it to be false.

L. 2. 78. Cit-
mate.

If an Horse or an Oxe eat one of these flies, presently he swells, growes mad, and shortly after bursteth and dieth. So *Alian. 6. de Anim. c. 35.* and *Hierocles* a Greek writer witnesseth it. He bids to binde the horses head, and to open the veins about his nostrils, that the blood may run forth of his mouth, and to rub it with Coleworts, and give him Fish-pickle and Oyl: and *Vegetius* likewise almost in the same words: If a Horse or an Oxe eat a *Buprestis* with the grass, his belly will instantly swell, he is inflated all over, he refuseth his meat, and he often and by little and little sends forth his dung.

To cure this, *Abfyrus* and *Vigetus* prescribe one; and the same remedy: presently get upon the Horse and cause him to gallop as fast as he is able, afterwards let him bloud a little in the roof of his mouth, and let him swallow the bloud as it runs forth, chewing it in his mouth; then keep him continually walking; let his diet be wheat steeped in sweet Wine with Leeks given him with a horn in Wine warm well beaten with Raisins. Some, as *Praxanus* taught them, pour Oyl into the nostrils of the Oxe, *L. 17. c. 17.* To Goats that are swoln with the Buprestis, apply Bacon-lard, or pour the fat broth of it down their throat, saith the same Author.

The Cynoprestis seems to be the same with the Buprestis, for that works the same effects in Dogs as this doth in Cattel: or if it be a different sort of creature from this, I confess ingenuously I have not met with it.

CHAP. XX.

Of the Cantharides, or Spanish Fly.

I know not what the reason was that the Cantharides above the rest so well known, of so great use in Physick were omitted by *Pennius* and *Gesner*. Which task notwithstanding I shall willingly undertake, and thus I begin their History. The word *καρθαεις* in Greek is the same in Latine; in French, it is *Cantaride*; in Italian, *Catarella*; in Spanish, *Cubillo*; in the German Tongue, *Grune, Kefer, Goldkefer*; in Low Dutch, *Spaensche, Ulieghe*; in English, *Cantharides*, or *Spanish Fly*.

Of the Cantharides two sorts have come to our knowledge, the one greater, the other lesse. Of the greater sort there are some thick and long, taken in wheat; and fat likewise as the Blats are, drawn with variety of golden lines, which in the wings run athwart, and those are accounted of the best use in Physick. Others are lesse and lean, hairy, called the innermost, not so fit for medicine. Of the greater sort also not all are of a glittering green, but some of them of a sad red, but all of them of an inexpressible splendor, and very pleasant to the eye.

The smaller Cantharides *Thomas Decat* first of all acquainted me withall, they seem to differ a little in shape and bigness; but have all the same virtue and original. Of these lesser, the first hath a long forked head, with black eyes standing out, the cornicles long and black, the wings coming forth of the middle of the loins; the which are marked with two silver coloured spots, and a few other white specks. They are commonly found in Kexes, or Asie Partly in the summer time. It hath feet and thighs very slender and long; of colour virmillion inclining toward a purple. The second is of the same colour with the first, but only that the eyes and cornicles seem to be green. Of the third the head and shoulders are not to be

distinguished, of a rusty colour, and the eyes as black as pitch; the wings of like colour with the head, but glittering with golden streaks, the feet black and short. The fourth is like the third, but only it is rather in colour of grass green, not rusty as the other: otherwise, except the bigness (for it is the least of all) it doth not differ. As well the greater as the lesser of these Cantharides, do not come of living creatures, but of dry and moist putrefaction. The race of Cantharides is bred in wheat and corn fields, and in fig-trees also. *Τὸ κατὰ φύσιν ἐν τοῖς σιτοῦ καὶ κριθῶν καὶ ἐν τοῖς κρηταῖς*, as *Alian* hath it word for word out of

Arist. in his 9. Book and 39. Chapr. They are bred also of the sponge of a Rose called *dens Caninus*, and of the Catterpillars which are found in Fig trees, Poplar, Pear tree, Ash, Olive, Rose trees; for in all these there are worms bred that are the originals of Cantharides, but in the white Rose they are less effectual. The Cantharides couple and generate likewise, but not a creature of their own species, but a worm only; they feed upon pulse and grain, but especially of wheat, and those which are so fed are accounted most fit for Medicine: they smell like Tarre, taste like Cedar, as *Nicander* reporteth.

Their virtue consists in burning the body, causing a crust, or (as *Dioscorides* will have it) to corrode, cause exulceration, and provoke heat; and for that reason are used mingled with medicines that are to heat the Lepry, Tettars, and Cancerous sores.

And in being mixt with Cecots or fit plaisters, they do cure deformities of the nails, causing them to fall off. They are used in medicines for Corns on the feet or hands.

Some

Signs and cure
of Canthari-
des drank.

Some anoint the places where the hair falls off, with Cantharides bruised and liquid Pitch, the skin being prepared with Nitre : they are good for Cantheries, but care must be had that they do not ulcerate too deep ; then some command to annoint those ulcers made, with the heads, or with the gall or dung of Mice mixt with Hellebore and Pepper. Cantharides mixt with quick Lime, cure Botches, as if you should cut them off with a razor. Some use to cast a little of them into Medicaments to provoke urine. But there is a great question of it, because they are poyson drank, in respect of the bladder that they afflict with perpetual torment. But there is no question but in oyntment they may do good with the juyce of wilde Vine, or with Sheeps or Goats suet. Some of my Masters put only their wings and their feet into Medicaments that provoke urine. We, saith *Galen*, are wont to cast in the Cantharides whole, and we judge those to be the best, that are found in wheat, and have a yellow girdle running athwart their wings to adorn them, *L. 3. & l. 11. de simpl. fac.* also put under, they mightily provoke the terms, and put to medicaments for the Dropsie, they are a very good antidote against it ; as not only *Hippocrates*, and *Dioscorides*, but *Galen*, *Avicenna*, *Rhasis*, *Pliny*, and the best writers do testifie amongst Physicians. I cannot here praise sufficiently the excellent use of them, with Leven, Salt, and Gum Ammoniac, to divert Catarrhes, to cure the Gowt in the feet and hips ; by drawing the matter that lies deep, from the centre to the superficies. Also they are good against the venome of the Salamander, as *Pliny* teacheth *l. 29. c. 4.* Also in some cases and in some compositions, they are good for such as want erection, and do promote venery very much. But as rightly mixt and exhibited in due proportions, they are good for ones health, so being not rightly mingled and given disorderly, they cause cruel symptoms and sometimes death. When *Anno 1579.* I staid at *Basil*, a certain married man (it was that brazen bearded Apothecary that dwelt in the Apothecaries shop) he fearing that his stopple was too weak to drive forth his wifes chastity the first night, consulted one of the chief Physicians, who was most famous, that he might have some stiffe prevalent Medicament, whereby he might the sooner dispatch his journey. But when it was day-break almost, there followed a continual distending of the yard without any venereous desires, and after that bloody urine, with inflammation of the bladder, and the new married man almost fainted away, all Antidotes profiting nothing a great while. I remember that the same thing hapned to a Noble man of *Francfort* in my remembrance, whom when an illiterate Physician thought to cure him of the Dropsie by giving him Cantharides, one in number inwardly, he killed him with lamentable torments. I have a singular remedy against the weakness of the Genital part, which when I used it indifferently, however it did great help to many Noble men, and no hurt, (who generally are more studious in venereous matters) yet it did one amongst the rest so much harm, that after venery (which he was too much addicted to) he pissed blood continually, and swoounded away frequently ; truly unless there had been plenty of milk at hand, this *Venus* bird had died and suffered deservedly for his Lechery and lasciviousness. Thus far for their Physical force, now we shall pass to their deadly and ignominious qualities. They are held to be amongst the number of poysons most deadly, not only by reason of their corroding and inflaming, but by reason of a putrefying quality they abound with. Their juyce entering into the veins either from the stomach, or by the skin, destroys a man like to poyson. Therefore *Ovid* when he wished mischief to his enemy, *lib. Trist.* wishes that his parents might give him the juyce of Cantharides to drink. *Cicero ad Petum l. 9. Epist. famil.* Cajus by the accusation of *L. Crassus* is said to have taken Cantharides : as if by that means he was resolved to kill himself. *Gal. l. 3. de Simpl. fac.* writ thus : If they be taken inwardly in a very small quantity, mingled with things fitting, they powerfully move urine, and sometimes corrode the bladder : whence it is manifest, that all things that kill by a cold quality, if they be taken in a small quantity they may nourish the body : but such as kill by putrefying (as Cantharides do) not at all ; since they are enemies to mans nature. *Cossiles* a Roman Knight, well noted for his familiarity with *Nero*, when he was sick of a dangerous Tetter, a Physician was sent for by *Cesar* to cure him, who gave him Cantharides to drink, and so killed him. *Pliny*. Also Cantharides were objected against *Cato* of *Utrica* (as the same Author saith, *l. 29. c. 4.*) as if he had sold poyson by open sale, because he set them at 60. Sextertia. But when they are drank too largely, or applied outwardly too long and too deep, they are wont to produce these symptoms. There happens pricking and pain in the bowels ; which is extended from the mouth to the secrets, and to the loyns, and haunches, and hypochondres, and they ulcerate the bladder with a painful ulcer, and inflame the yard and the parts adjacent with a vehement Impostume : then they piss blood, and after that pieces of flesh. Sometimes there followes a Diarrhoea and Dysentery, swoounding and dulness, and the minde is perverted, and there is nauseating and heaviness, and a frequent desire to make water and go to stool ; but almost it is in vain. They taste a taste of Pitch in their mouthes : all which symptoms are set down in *Dioscorides l. 6. c. 1. Gal. lib. de Theriac. ad Pison. c. 4.* and *l. 3. de Temper. c. 3.* and in *Rhasis lib. 8. c. 17.* To those that are so infected and affected, *Dioscorides* first prescribes frequent vomiting, then frequent Clysters made with Nitre to cleanse the guts ; then to preserve the bladder, he gives milk inwardly and flea-seed. And he will have their Clysters made of other matter than at first, namely of Barley water, Marsh-mallows, whites of Eggs, Musilage, of Linseed, Rice-water, decoction of Fennugreek, Hydromel, fat Broths, Oyl of sweet Almonds, Goose-grease, yolks of Eggs. Also he bids to give inwardly Cowes milk that is sowre, Hydromel, kernels of the Pitch-tree, the great and

the small, sweet new Wine, Ducks grease, a decoction with Diuretick seeds, (namely the four great cold seeds) and decoction of figs with syrup of Violets. Oyl of Quinces is commended as the certain Theriack for this disease, as also oyl of Lillies, and Samian clay. *Rhasis* after that Clysters of fat Broth are cast in, will have incoction made into the yard with Oyl of Roses, and the sick shall be put into a warm bath in a great Vat. *tit. 8. c. 17.* Authors are not agreed in what part the poyson of Cantharides doth lie. Some think it lyeth in he head and feet, and others deny that; yet they all agree that the wings are an Antidote in what part soever the poyson lyeth; and those being taken off it is deadly; so that this venome hath its remedy joyned with it. *Plin. l. 11. c. 35.* *Lyrus* of Naples writes that Purslain is an Antidote against Cantharides, which *Pliny l. 20. c. 13.* affirms of white Basil: who also *l. 23. c. 2.* and *4. l. 28. c. 10.* commends very much Vinegar of Squils, Oyl of Dill, Cowes Milk, and Broth of Goats flesh. And thus much shall suffice for the History of Cantharides, which I wonder that the most learned *Gesner*, and especially *Pennius* overslipt.

CHAP. XXI.

Of Beetles.

THE Beetle is an Insect that may be called *καλέοντες*, as if he had his wings in a sheath. **The Name.** It is bred of putrid things and of dung, and it chiefly feeds and delights in that. The Greeks call it *καλέοντες*; the Tyrians, *βύρρον*; the Germans *Kaefer*; the Italians *Escuravaio*, *Pololero*; the French, *Escarbot*; the Polonians *Krewka*; the Illyrians *Krabak*; the English, *Beetle*, or *Bug*; the Northern English call it *Klock*; but the Southern, *Starkenbeken*; the Arabians, *Kanasis* and *Kanasēs* by *Avicenna*. The Greeks all with one consent, hold that all Beetles are males, whence **Their Sex and Description.** one may easily understand the sense of *Ausonius* his Epigram upon *Marcus* that was gelded. *Rhodiginus l. 8. c. 5. Antiq. lect.* renders it to us. Also the Egyptians caused a picture of this creature to be made on the starnes of their Heroes, intimating thereby their manhood, that had no mixture of feminine weakness; for men must be valiant and manly, feminine pusillanimity is a great disgrace to them. All Beetles cast their skins, and they have no sting: when you touch them they are afraid, and they leave off to move, and they grow hard. *Albertus* did vainly ascribe to them four wings hid under a crusty cover, for experience shewes but two, very tender and frail, wherefore they have them shut up in a hard cover over them, to defend them that they may take no hurt by hard bodies. For the greatest part of them either digs under ground, or bites rotten wood with their teeth, and makes houses and nests there: so that if they were not excellent well guarded, they could never keep themselves safe from external injuries. When they fly they make such a humming or noise in the air, that *Laertius* writ that the gods talk with men by these creatures. Of all plants they cannot away with Rose trees, and they hate them as the destruction of their kinde; for they dye by the smell of them (as we read in *Geopas*) but on the contrary they take great pleasure in stinking and beastly places.

I remember one was wont to cleanse privies, when he came into an Apothecaries shop at *Antwerp*, and smelt the spices, he presently fell down in a swoond, which one of the standers observing, he went and gathered up some horse dung in the street and put it to his nose, and so a man used to stinking smells was recovered by a stinking smell. Therefore it is no wonder if a Beetle (that we said before was bred and fed with dung) being anointed with oyl of Roses, be killed thereby; they are the words of *Clemens Alexandrin. 2. Pedagog.* which also *Plutarch* elsewhere, and *Alian* also affirm. They abhorre the smoke of *Alaud*, especially of the leaves as of *Pulsamus*, *Acegi*, Cow dung, and *Nigella* seed, *Rhasis 88.* The Hemerocallis of *Dioscorides*, is called by some *αντιβητος*, for the great force it hath to kill Beetles: but as they do extremely shun those plants, so they very much affect Ivy to be under its shade, and they naturally delight to go under it, under which when they are gathered in heaps, it is an easie matter to catch them, for they will hardly go from it. Beetles are some greater, some less. The great ones, some have horns, others are without horns. Those that have horns, some are like Harts horns, others like Goats horns, others have Bulls horns, others have Rams horns: some have horns in their noses: we shall speak of them all in order. The *πλάστιξ*, or Harts horn Beetle is called *Lucanus* by *Nigidius*; as *Pliny* witnesseth. Some call it the Bull, others the flying Stag: *Hesychius* calls it *αετὸς*, because it laies hold on things in its way with thorny horns; the Comedian and *Eustathius* call it *πρωτόβητος*, because it is the greatest of all; *Carranus* calls it *οραεβλητος*, a word compounded of Greek and Latin; *Gaza* calls it *αετὸς*, the Italians call it *Cereti*, and vulgarly *Polupeso*; the French, *Cerf volant*; the English, *Stag-fly*, or *Flying-fly*; the Hollander, *Vliegheende hert*; the Illyrians, *Gelin*; the Poles and Slavonians *Krowka*, *Wielka*. Amongst all the horned Beetles, for the shape of its body, length and magnitude, it may challenge the first place, and is the most noted. It is blackish, of a dark red, especially about the outward cover and the breast; it hath two whole horns without joynts, and with branches like a stag as long as ones little finger in such as are grown up, but they are less and shorter

The use of
broad horn
Beetles.

The name and
description.

ter in the young ones : or (as *Pliny* saith) it hath long and movable horns nicked with cloven pincers, and when it will it can bite or nip with them. For it will close them wonderfully, and useth its horns for that end for which Crabs and Lobsters do their claws. The eyes are hard, putting forth and whitish, it hath fore-yards on both sides of them, one pair that are branched between the horns & the eyes, the joyn't whereof makes almost a right angle, and two more breaking forth of the midst of the forehead straight and plain, ending as it were in a little smooth knot; it goes upon six feet, the fore feet are longer and greater than the rest. *Lo-nicerus* makes this to be the male : but I (if there be any distinction between the male and the female) shall not doubt to call it the female; both because the other kinds of beetles are less, (for as *Aristotle* observes the males in Insects are far less than the female) and also in copulation the females receive from the lesser, as experience confirms it. The male is altogether like it, but 'tis less both for body and horns; which though they be not branched on both sides, yet pressed together they do more sharply prick ones finger, than the female doth. The third is three or four times less than the former; a black colour, with little cloven horns, near to which there arise two fore-yards distinguished with many joyn'ts. It hath eyes a little standing forth, and that are great in respect of its body. The shoulders on both sides end in an acute angle. It feeds for

the most part in a clammy fat juyce coming forth of the oak; nor is it easily to be seen but where oakes grow. The fourth kinde is very rare, it hath two little horns, thrice branched inwardly, they seem whitish from black, the back is parted with black and white spots, but the belly with silver coloured and blew. It goes on six feet, which are no less black than the fore-yards: when the head is cut off, the other parts of the body live long, but the head (contrary to the usual custome of Insects) lives longer. This is said to be dedicated to the Moon, and the head and horns of it wax with the Moon, and do wane with the Moon, but it is the opinion of vain Astrologers. The horns

are not without their Medicinal vertues; for they cure childrens diseases; for hanged about their necks, if they be great horns and full of branches, they serve for an Amulet. Laid to scrophulous humours and the Gout, they help much, especially if they be applied with the earth they have cast up. *Pliny*. If horned Beetles they call stags, be boyled in wine, and the arteries of the armes be anointed with it, it cures Agues. *Miraldus*. But I note by the way, that *Guillerinus* of shell fish, was not very wise, who writing a Book of the Nature of things, was quite out, when he placed that flying Stag amongst the Grasshoppers; sometimes he makes it a Locust, sometimes a *Bruchus*, sometimes he confounds it with a Glow-worm, conjecturing every way, but teaching nothing. The Philosopher saith that those Stag-flies are bred only from worms

growing in rotten wood. But I rather approve of it, that they breed from dung as experience testifies. *Αιζόκαρος, τραχέκαρος, κεραμβύς, κεραμβύλος* (these are words that are synonymous) in Latine, *Capricornus*; the Germans call it *Holtzback*; the English, *Goat-chaser*; in greatness and colour it resembles broad-horn, it hath a little broad head, great ox eyes, almost three fingers over-

thwart in length; it hath a forked mouth, gaping and terrible, with two very hard crooked teeth; with these whilest he gnaws the wood, I speak by experience) it doth perfectly grunt aloud like a young pig. May be this is the reason why *Hesychius* hath related that they bound to a tree, will drive away fig-gnats. The shoulders of it are curiously wrought by nature, they seem to be a hilt made of Ebony and polished, it hath six feet, distinguished with three little knees; but they are very weak and faint, and altogether unfit for such a burden. These receive help by two horns that grow above their eyes, and are longer than their whole bodies, they are flexible with nine or ten joyn'ts; not exactly round, but are rough like Goats horns, which although it can move them every way, yet when it flies it holds them only forth directly, and being wearied with flying, she useth them for feet: for knowing that his legs are weak, he twists his horns about the branch of a tree, and so he hangs at ease; as our *Brucerus* saw in the Countrey about *Heidelberg*; in that it resembles the Bird of Paradise, which wanting feet

feet, clings about the boughs with those pendulous nerves, and so being tired with labour, takes its ease. They thrust upon us some German fables, as many as say it flies only, and when it is weary it falls to the earth and presently dies. Those that are slaves to tales, render this reason for it: *Terambus* a Satyrist, did not abstain from quipping of the Muses, whereupon they transformed him into a Beetle called *Cerambyx*; and that deservedly, to endure a double punishment, for he hath legs weak that he goes lame, and like a thief he hangs on a tree. *Antonius Libealis* lib. 1. of his *Metamorphosis* relates the matter in these words: *The Muses in anger transformed Terambus because he reproached them, and he was made a Cerambyx that feeds on wood, he is seen upon wood, and he hath crooked teeth, and he alwaies moves his jawes; he is black and long, having wings on his belly, as the greater Beetles have; he is called the Wood-eater Oxe; but in Thessaly, Cerambyx. The children catch them to play withall, and they pull off its head and carry it, and it shewes with the horns like a harp made of a Tortois-shell.* Which words, whilest *Xylander* strove to put them into English (one otherwise well skill'd in the Greek tongue) he committed two great errors; first, by taking *Cerambyx* for a Bird when he called it a Fly; secondly, because he translated it, that the head with the wings are like a Harp, when as the Greek book hath it the horns. But whether this be that kinde of Beetle that runs up and down, and makes a noise like a kid in the leaves of *Briphia*; (the Wizards say there is no better remedy to cure the voice) truly I am ignorant of it, but I suppose it is the lesser Beetle, because the stalk of Fennel gigant would scarce contain

this when he is grown great. We have seen divers kindes of *Cerambyces* besides this we now speak of, one that was like to the first of these, but differing in magnitude and colour; the belly thighs and horns were of a waterish blew; the shoulders, tail and cover wings were varied with some black spots, also the joynts of the horns were black; the hinder legs grew longer than the rest: we received these from *Quickelbergius*, who sent them from *Antwerp*; we have one more that is green without, and underneath dun coloured; the head, shoulders & cover wings are a dark green, and shining also with gold: it is something a long body, and seems like the other, but it is something less; it hath purple horns, but the feet and the legs are of a violet colour. I first gave to *Pennius* a third that was of like colour to this, it smelt almost like Nutmeg and Cinamon. But that sweet smell (as good as the oyl of Myrrhe) presently when it dies evaporates into the air, and leaving the body, doth wholly insinuate it self into the box it was kept in. *Cardanus*

makes mention of this Beetle, but I know no man that found it before me.

There is yet one of a shining black, that hath a great belly, thick, with a body and horns shorter than the rest, the joynts of the horns are not round as they are in the rest, but lightly saw'd on both sides. *Pennius* saith he is beholding to *Carolus Clusius* for it. The fifth is altogether like the first for head, mouth and reeth, with very black eyes; a brown colour all over the body, a mouth wide open and dented; the head, neck and wings are bespotted with very small black spots; the body of it is almost as great as the second *Cerambyx*; it is but seldome seen, it lives in houses and dry wood. The sixth is ash-colour with a very little head, the eyes are both white, the horns are somewhat long, joynted, distinguished with white spots; the cover wings, and almost the whole body

is

is various, it is conversant in houses, but whether it dwell in wood also I know not. I saw the seventh brought from *Russia* by *Edward Elmer*, it was brownish all the body over, it had round joynts on the horns 7 or 8, it is easily known by its form. There is an eighth kinde not far differing from this in figure and magnitude, but that the head, shoulders and wings are blewish.

The Use.

Jochimus Camerarius sent a ninth to *Pennins* (he was one that deserved singularly of the Common-wealth of learning) the wings and feet were of a sandy colour; the head, the horns and belly were blackish; he had bowed horns made with many turnings and knots, which he turned to both sides in the twinkling of an eye; it creeps upon plants (especially on *Cythifus*) I think the Beetle which *Johannes de Chaul* describes *lib. de varia quercus historia*, ch. 26. is of this kinde: There dwells a creature in the oake, of the kinds of Beetles, (so far as we can conjecture) it is of a blackish colour with long legs, carrying two prickles in its head a little crooked, wherewith he layes fast hold of what he meets with. Those Carpenters that how timber of oake, found this little creature alive in the very heart of the oake. The countrey people of *Lyons* call it *Thurro*; it lives best and longest in roofs of houses, and it sometimes comes forth and shewes it self making a little noise, in places where stoves are. *G.* of pious memory, *Epist.* l. 3. saw such a one, or one like it, voided by an old woman that was sick of a *Pleuresie*, his words are these: An old woman that was sick of a *Pleuresie*, voided a black Beetle downward, after she had drank a Potion of our *Oxymel* with a decoction of *Fenugreek*; it had long feet, horns that were joynted and were flexible; it was full of raw putrefaction, and alive; it was as long as two joynts of ones finger. The tenth is all purple coloured from black, and hath a forked mouth. The eleventh is all black. The twelfth hath horns that are not so much joynted, the head and

shoulders are blew; all the rest of the body seems a bright red. However you see the horns of all these, some straight, others crooked in their pictures, (for to explain them the better) yet for the most part they wear them with a bending of them backward to their shoulders, as goats do, as you see the first *Cerambyx*: and upon that account I think it fit to put them into the same rank. And thus much for *Cerambyx*, or *Capricorn*, and its kinde.

I have learned no other use of them in Physick, than that taken in the left hand, they drive away quartain Agues. *Plin.* l. 30. cap. 11. It may be posterity, by better experience will discover more of their vertues, and will not suffer themselves to be perswaded that a creature God hath made so curiously can want rare vertues in Medicaments, which he hath bestowed on far baser things (according to his goodness unto mankind) Flitter-mice take this for their chief dainties, and prefer it before Gnats, especially if they can catch them and squeeze them alive.

Bucalus, or *Taurogaster*, Oxe, or Bulls horns rather, hath alwaies two horns standing straight and right forth; it is blackish from red, and seems almost without any head; yet it hath a very small head sunk into its short thick shoulders, and a little thorn comes forth of the middle of the forehead, very sharp for defence. We have seen four kinds of Nose-horns, the chiefest and greatest of all lives in *India*, it is very black, it hath a nose on its face crooked horn'd like to the stern of a ship; about the middle whereof there is another horn bent inward, and comes forth of a little knot, and such another comes out of a bunch on the shoulder; the whole body from the end of the horns to the tail is four inches long, and it is about two inches broad. Like to Beetles it hath no female, but it shapes its own form it self. It produceth its young one from the ground by it self, which

Joch.

Joach. Camerarius did elegantly express, when he sent to *Pennius* the shape of this Insect out of the storehouse of natural things of the Duke of Saxony; with these Verses:

*A Hee begat me not, nor yet did I proceed
From any Female, but my self I breed.*

For it dies once in a year, and from its own corruption, like a Phoenix, it lives again (as *Monimus* witnesseth) by heat of the Sun.

*A thousand summers heat and winters cold
When she hath felt, and that she doth grow old,
Her life that seems a burden, in a tomb
Of spices laid, comes younger in her room.*

The second kinde of Nose-horn very rare and worthy to be seen, sacred to Mercury, *Carolus Clusius* sent painted from *Vienna*, where it is very frequent, the form is as you see it: it would seem all pitch colour, but that the belly is a full red; that crooked horn in the nose is so sharp, that (what is said of an Elephant going to battle) you would think it had got an edge by rubbing it against a rock. The third Nose-horn, and fourth seem to be alike, but that the former hath wings growing out longer than the sheath covers, but the others are shorter. You would say they were rub'd with shining ink, they are so perfectly all over black. The Ram or *κερκορας*, hath knotty horns, violet colour, a head greenish from gold colour, the shoulders like vermillion, a purple coloured belly, sheath wings of the colour of the head, it goes forward with legs and feet, of a light red, but the wings shut up in the sheath, do fitly express the small whitish membrane of a Cane.

The greater Beetles without horns are many; namely, that is called *Pilularius*, and another that is called *Melolanthus*; another purple, one again that is dark coloured; one called *Arboreus*, and another *Fullo*. Some call the *Pilularius* the dunghill Beetle, because it breeds from dung and filth, and also willingly dwells there. The Greeks call it *κορπιδν*, and *ηλιονιθιας*, and from its form like a cat, *Αινεσμορς*; the Germans, *Rosskafer*, *Kaats*, or *Mistkafer*; in English, *Dung-beetle*, *Sharnbugg*; in French, *Fouille merde*, as you would say *Dung-digger*; the Latines call it *Pilularius*, because it turns up round pills from the dung, which it fashions

by turning it backwards with its hinder feet. *Porphyrie* doth thus describe the nature of it: All your *Pilularii* have no females, but have their generation from the Sun; they make great balls with their hinder feet, and drive them the contrary way, like the Sun it observes a circuit of 28. daies. *Alian* saith almost the same. There is no female Beetle, it puts the seed into a round ball of dung, which it rowls and heats in 28. daies, and so produceth its young. They would say

R r r r

thus

thus much: that the Beetle called *Pilularius* makes a round ball of the roundness of the Heavens, which it turns from East to West so long, till it hath brought it to the figure of the World; afterwards it laies it up under the earth where it breeds, and when that hath to laid it up, it lets it remain there for a Lunary moneth; when that is ended, it casts every ball out of its nest by it self, which being dissolved in water, the Beetle-worm comes forth without wings, but in a few daies it growes up to be a flying Beetle. For this reason the *Egyptians* consecrated this to *Apollo*, and adored it for no small god, by the curious interpretation of *Apion*, whereby he collected, that the likeness of the Sun was given to this creature, and so he excused the idolatrous cultomes of his Countrey, *Pliny* and *Plutarch*, *Symp.* 4. They wonderfully hate *Roses* as the plague of their family; but dung, especially of *Cowes* and *dunghills*, they love so much, that smelling the smell of them a very great way off, they will fly suddenly to it. *Theoph.* of *Smel.* But they go but slowly, yet they labour continually and exceedingly, and delight most of all to produce their young ones, for oft times the little round balls that they make, by the injury of the winds or of the place, fall away, and fall from a high place to the bottome; but this Beetle desiring a propagation, watcheth with perpetual care, and raising this *Sisyphian* ball to its hold with continual striving, and that tumbling back again, at length she reduceth it. And truly unless it were endued with a kinde of divine soul (as all things are full of Gods wonderfulness) it would faint and be spent in this great contest, and would never take this pains any more. Some say they die being blinded by the Sun; but the most think they are choked by lice (that creep all about them) they hardly hold out one winter. They chiefly delight in the shade of the *Ivy-tree*, as most healthful for them. *Praxan.* in *Geopon.* I have set down the form of it so exactly, and in its colours (for it is all black) that I need say no more. Beetles first breed from dung (saith *Jehan. Langius*) as the Worms breed out of rotten wood: then their seed being shed into a round ball, and the same being enlivened, breeds their young ones: every one knowes this sufficiently, unless they live where no dung is; for in dunghills they are obvious to every Man.

Their use for
our understand-
ings, and by
example.

Beetles serve for divers uses, for they both profit our mindes, and they cure some infirmities of our bodies. For when this living creature, (and scarce a living creature, for it wants some senses) being of the basest kinde of Insects, and nothing but a crust, doth excel man in divers faculties; this should teach us modesty, temperance, labour, magnanimity, justice, and prudence. For though its house be but a dunghill, yet it lives contented therewith, and is busied and delighted in it; nor doth it more willingly drink or eat amongst *Roses* than in *Goats* dung, which smells in its senses as sweet as *Marjoram*. For it lives by the law of Nature, and will not exceed her orders. The greatest care it takes, is to make the greatest balls it can, as if they were sweet balls, which with wonderful labour it rolleth from her; and if it chance to roll its burden against some heap, that the balls slip away and fall down again, you would imagine that you saw *Sisyphus* rolling a stone to the top of a mountain, and falling back again upon him, yet is it not weary, nor will it rest, till it hath rolled it to its nest, so earnest it is about its work. But we poor men do nothing that is worth our labour, or as we have power to do, and we give off in the very steep entrance of vertue, and we spend all our pains and daies in idleness, following ill counsel, till we get a habit of mischief to our own destruction. Who doth not see the courage of the Beetle? if he shall observe him fighting with an Eagle (as 'tis related of the Beetles in *India*) I believe that it will come to pass, (as *Erasmus* said) that some man extremely favouring the Roman Commanders, will lament for the Eagle, that the combate falls out upon so kingly a Bird to fight with so mean and despised enemy, for to conquer it, it is no glory, but to be conquered by it is the greatest shame, and the Beetle will win praise enough that he strove with an Eagle, though he should be overcome. The Poets say that *Ajax* was ashamed of so weak an adversary as *Ulysses* was, and valiant Captains disdain to contend with common souldiers. Again, a man would wonder whence this mean Insect hath gained so much courage, and boldness, that it dares wage war with the strongest of Birds; also whence it hath means, force, faculties, and patience, that it can contend so many years with the Eagle, without any reconciliation. But if any man will unfold this secret, and view this contemptible creature nearer, and as it were at home, he shall observe so many rare properties of it, that when he hath considered all, he will desire to be a Beetle rather than an Eagle: yet that no man may stop or stay me before he knowes the matter: First of all, it exceeds the Eagle and men too in this respect, that it yearly renews its old age, and growes young again. This is so great a matter, that I think all earthly potentates, when they come to that inmiabile old age, that they must part with all, would rather with Beetles change and cast off their dregs, than they would receive a seven fold Crown. Again, what huge courage of the minde is there in so small a body? what an heroical magnanimity? what a force it hath in battel? that *Homers* Fly is nothing to the Beetle. It hath not a wit so common, but it was of old reputed for it, and commended in all places. Hence was that Greek proverb *Karbidēs* σοφώτερος. *Wiser than a Beetle*: whereby they ascribe to it, a singular and incomparable wisdom. Nor doth that concern me if any man will cavil and say he dwells ill favouredly in an uncomely house, for I shall rather justly condemn their household government, who being ill favoured themselves, and of filthy conditions, do build their houses curiously and lustily with so great care, and charges of King *Attalus*. Moreover, that it useth the excrements of living creatures for its own commodity is no fault, but a commendation of its wit and ingenuity. As though we that are Physicians did not the same things, as often as we apply the blood, the flesh, the urine, and some-
times

times the ordure and dung of living creatures to our patients, and sometimes we give them in Potions. Nor are Alchymists ashamed (who would be divine men indeed, and not mortal, could they obtain what they aim at) to use dung to draw forth that quintessence. Nor are husband-men (a sort of people that of old time none were more honoured, none more sacred now) ashamed to dung their fields. And it is probable they first learned their Art from the Beetle called *Pilularius*. For why should it chiefly include its seed in dung, unless God would have that there should be in that a great deal of vegetative heat and moisture, whereby principally generation is perfected? Hence it is that wise Farmers dung'd their fields to make them more fruitful, and to conquered that horrid leanness, barrenness and poverty of their grounds. But you will say that the Beetles *Pilularii* like the smell of so stinking a thing. It were a folly to look for a mans nose in a Beetle, for that is peculiar to man to be displeased with the sent of his own dung, and so is it not with any other creatures; therefore the Beetle is more happy than we, but not more uncleanly: yet men are not so much offended with it, as it is, but as they conceive of it. For of old time it did not seem abominable to them as it doth to us, for they called it by a lucky word, *Lutamen*, and they thought fit to call *Saturn* the dunghill god; for his honour, if we will believe *Macrobius*. For *Pliny* saith that *Sterculus* the son of *Faunus* got not only the name, but also immortality by it in *Italy*. Moreover the same thing in *Greece* procured to two Kings great glory; to *Angeas* who invented it, and *Hercules* that spread it abroad. Lastly, the memory of that old King will never be abolished, whom *Homer* (as *Cicero* saith in *Cato*) commended to posterity for dunging the ground with his hands, and for no other thing but that the Beetle is delighted in. A Roman Emperor was nothing offended with the smell of urine, if it brought profit with it. Wherefore then should we be offended with the *Pilularii*, who hath so many good properties, for one small inconvenience? if we call that an inconvenience that is most commodious for the fostering of its young. Lastly, when we see the Beetle, though in the dung, alwaies clean, and his shell alwaies neat; compare him with men polluted and infected with stews and bawdy houses, and I shall ask which of the two is most cleanly? And I think it had its name *Kabagos* a Beetle from *Kabagos* pure and clean. If any man thinks these gifts to be trivial and vulgar, yet no man but will think that a magnificent thing, and worthy of great honour; that of old time the Beetle was the chiefest amongst their sacred images and myteries of their Soothsayers. It is the most apt Ensign of a famous warrior. For (as *Plutarch* reports in his Comment of *Isis* and *Osiris*) in the hieroglyphical pictures of the *Egyptians*, an Eye was the Embleme of a King, a Scepter being added to it, for it signified a right and just administration of things. But he saith, at *Thebes* their Images that wanted hands, those represented Judges, who ought to be free from bribes; and amongst these there was one also that wanted his eyes, which represented the chief Judge, because he ought to be free from all passions, and to look on the business, and to hear or to respect no mans person. It was not Pimpernel amongst pot-herbs (as the proverb is) but a Beetle ingra-ved in a Seal amongst the sacred Images. And what did those wise Theologians intimate to us thereby? no common thing indeed, but a valiant and invincible Captain. For *Plutarch* saith as much, that no man may suppose that I invented it; as your common Theologians use to invent Allegories. But some ignorant fellow may say, what hath a Beetle to be compared with a Commander in an Army? Truly they agree in many things. First you see the Beetle is all in armour, and there is no part of its body but is guarded with plates and harness, that *Mars* in *Homer* cannot be said to be better armed when he is in compleat armour, and fenced cap a pie. Add to this his warlike march with a horrid and terrible humming: what is there more unpleasant than the sounding of Trumpets? what more loath'd than the beating of Drums? for the sounding of Trumpets that Kings now so much delight in, the *Busrude* could not endure, because it seemed like to the braying of an Ass, and the Ass was held abominable amongst them. Add hereunto the wonderful patience of the Beetle in driving on its burden, its invincible courage and contempt of life. To this, men say there is no females amongst Beetles, but they are all males. What can better beseeem a valiant General than to have no female in his camp himself, nor allow others to have them? Moreover this is fit for the matter, that in those delicate bals we speak of, they exclude their young ones, foster, cherish, and bring them up, and they have no other place to breed in than they have to feed in. But this secret is not easie for me to open; Souldiers in war can better do it, who know how to lie in their armour, or on the bare ground, that in a siege have undergone hard winters, and harder hunger; that have sustained their sad life not with roots of herbs, but with filthy food, who have for some months lived in want at sea. If any man consider the beastliness of these mens conditions, the Beetle will be a cleanly creature; and consider but their misery, and you will think the Beetle happy: yet this is the lot and condition of Generals, that no man may despise it. But by the way, I wonder what ails our great men, that hold all their Nobility to lie in their Scutcheons, that they had rather have Libards, Lions, Dogs, Dragons, Wolves, or any other creature that they chance to meet withall, when as their proper symbole is the Beetle, both as the fittest, and was so used and approved from eldest times, which is the only parent of Nobility? As for the form of its body (let go only preposterous judgement and opinion) and there is no reason why the Beetle *Pilularius* should be despised, or can be; for if Philosophers say true, that a spherical figure is the most comely and the best, why then shall not the Beetle seem comely, which from the judgement of *Demiurgus* is nearer to it than an Eagle or a man himself? *Clem. Alexandri. l. 5. Stromat.* And though

the Beetle have a face like a Cat, a creature familiar with us, and more useful, than it is desired for its self, yet in that respect the *Egyptians* adore it, and prefer it before all other Insects by many degrees. *Calcaginnus*. Lastly, if a horse be beautiful in his kinde, and a dog in his, why should not the Beetle be so in its kinde? unless we measure the forms of all things by our own, that what is not like us must be held to be ugly. No man of a sound minde will finde fault with the colour of it, for it sets forth some jewels, and in special the Diamond that is the chiefest jewel. Lastly, no man will think the Beetle at all despicable, who shall consider with himself, that Magicians and Physicians fetch remedies from this creature for the greatest diseases; for they are not only carried in mens purses, but also hang'd about their necks, and oftentimes shut up in gold against all childrens diseases. What will you say if in the most effectual and incredible remedies almost, (for *Pliny* is the Author of it) it hath equal force with Antidotes? for that terrible Beetle engraven on an emerald, yeelds a present remedy against all witchcrafts, and no less effectual than that *Moly* which *Mercury* once gave *Ulysses*. Nor is it good only against these, but it is also very useful, if any one be about to go before the King upon any occasion: so so that such a ring ought especially to be worn by them that intend to beg of Noblemen some jolly preferment, or some rich Province. It keeps away likewise the head-ach, which truly is no small mischief, especially to great drinkers. Who then can despise the Beetle, whose very image engraven upon stones hath so great vertue? The mentioning of precious stones puts me in minde of adding this also: that if the Eagle delight in the precious stone of her name, the *Aetites*; the Beetle comes not behinde her in its share of the same honour, for the stone *Cantharidis* also owes its name to it, wonderfully resembling the whole figure of the creature, so that one would say it is not the shape represented, but a living and true beetle inclosed in the stone. Moreover this impure and filthy creature (forsooth) boyled with worms in oyl of Roses, doth very well cure the pains of the ears. *Plin. Avicen* prescribes the Beetles called *Pilularii* being stamped alone, to be boyled without worms, which the Author of the Book *ad Pisonem*, approves also, *chap. 12. Sylvaticus chap. 94.* writes thus out of *Avicen*: The *Dung-Scarabees* help the pains of the womb, they provoke urine and monethly termes, they procure Abortion; with *Cordumeni*: they are good to heal the Hemorrhoids, and they help that benumbedness which comes of venomes infused by living creatures; and the oyl in which they are bruised takes away the pains of the ears. The later writers commend these Beetles dried among the remedies for the Stone: especially *Alexand. Benedic. Lanfrancus* makes for the cure of the Stone this kinde of powder, which is no ordinary one: Burn the *Dung-beetle* or any other after the same manner as you do Grasshoppers, or Scorpions; Take of the ashes of them grains v. of Hippocras j. dram, of Pigeons dung j. dram and a half, let them be dried and a powder made of them. The Dose is j. dram with water of the decoction of Radish, Brambles, or black Chiches. For the Hemorrhoids this ointment is very much commended. Take of oymntment Populeon j. ounce, of oyl of Roses in which 20 Beetles and as many Chisleps have boyled a good while j. ounce and half, of Saffron gr. iij. let them incorporate and be made into an oymntment. *Arnoldus de villa nova Breviar. l. 1. c. 25.* reports that he had gotten of his master a singular oymntment against the Convulsion, made of Beetles after this manner: Take of Pepper, Euphorbium, Pellitory of Spain, each alike, of Beetles to the weight of all the rest; let them all, being brought to a powder and mixt together in a bath with juyce of Spear-wort as much as sufficeth, be macerated and made in the fashion of an oymntment, with which let the pulses of the armes, feet and temples, with the navel and back-bone, be anointed. Moreover, *l. 4. c. 11.* he prescribes for the awakening of such as are troubled with the Dead sleep, and with the Lethargy (when *Cantharides* and Cauteries have done no good) two or three *Dung-beetles* alive put up together under half a walnut-shell, to be made fast about the nape of the neck, being first well shaved, and upon the muscles of the forepart of the arms (on every muscle one) and under the sole of each foot one, because this doth wonderfully rouze up such as are in a Lethargy. And Mr. *John of Florence* (saith *Arnoldus*) awakened one that had been held with a Lethargy for seven dales, with this remedy, having tried all others in vain, and cured him afterward with *Cantharides* laid upon the nape of his neck to blister it. The *Dung-Beetles* are best for this purpose, they are next which use to be found under stones, and then they which are found in a bath. The *Solar Beetle* cures them who are sick of a *Quartan Ague*, saith *Ælian. Pliny* and *Trallianus* shew us the way of using it; which is, when it is hung about the neck alive, and wrapt up in a piece of red cloth, and this they testifie they have seen confirmed by many experiments. Yet the Magicians will scarce finde credit, when foolishly rather than truly, they report and imagine that the precious stone *Chelonitis*, that is adorned with golden spots, put into hot water with a Beetle, raiseth tempests. *Plin. l. 37. c. 10.* I say nothing of the Eagle, the Woodcock, the birds called *Laniis* by *Gesner*, in whose nests Beetles stuck upon thornes (which our *Bruerus* first observed) are an argument, that they serve for this use also, to feed Birds. Nay *Bellonius* affirms that many other living creatures, especially Frogs that are in Marsh grounds, feed upon them. And indeed though the Eagle, its proud and cruel enemy, do no less make havock of and devour this creature of so mean a rank, than our lordly Storks use to do the peasant Frogs: yet as soon as it gets an opportunity, it returneth like for like, and sufficiently punisheth that spoiler. For it flyeth up nimbly into her nest with its fellow souldiers the *Scara-beetles*, and in the absence of the old she Eagle bringeth out of the nest the Eagles eggs one after another, till there be none left: which fat-

ling

ling, and being broken, the young ones while they are yet unshapen, being dash't miserably against the stones, are deprived of life, before they have any sense of it. Neither do I see indeed how she should more torment the Eagle than in her young ones. For some who slight the greatest torments of their own body, cannot endure the least torments of their sons. We see Asses, (those sluggish and almost senseless creatures) run to the help of their foals through fire, if it be in their way, with a strange contempt of their life. So that I cannot but admire and magnifie the Beetles inbred wisdom in the choice of its revenge. But enough of this, lest I should seem to have made (not an Elephant of a fly, but) a Gyant of a Beetle. I will confess indeed, that as I was loath to make a great volume about a small thing, so I accounted it a sin to bury in silence what I had read. I wonder at *Pennius's* brevity and emptiness in this argument, since in *Lucian, Pliny, Homer, Aristophanes, Theocritus, Alexandrinus, Erasmus*, and infinite other Authors, wonderful things are recorded of the Dung-Beetle, well worth our mentioning;

There is another altogether like the Dung-Beetle, but of a darkish bright blew colour, with a notable shining. This in the moneth *August* is troubled with lice hanging between its legs, and at last kill'd with them. I should rather take this for the cat-fashion'd Beetle, because an egge is not more like to an egge, than this is to a cat. It is met with every where, but I have more often seen it about *Colchester*. Let us go forward.

That which I should call the Emerald coloured or greenish Beetle; the Greek comick Poets all of them call *μυρολόγῳ*, the *Atticks* *μυρολόγῳ* and *χρυσάλῳ*. *Eustath.* Some likewise call it *χρυσόμυρολόγῳ* and *χρυσόμυρολόγῳ*, but without right. It is taken by some for the Tree-Beetle, but its place tells us it is a mistake. The *Rusticks* in Lombardy call them *Gallerucas*, as much as to say, French *Palmerworms* (as *Niphus* interprets it) though yet they agree in nothing with *Palmerworms*. In

Dutch it is called *Gruenen, Odon, Goudkasper*; in Italian, *Mariola*; in Polonian, *Zielonakrorka*; in English, *Greenchaser*. The opinions of writers are divers about this little creature; both because this kinde of Beetle is not every where easie to be found, as because it seemeth to be very near the *Cantharis*. Some will have it to be the *Cantharis*, but for the most part there is wanting in it that cautlick virtue. The Scholiast upon *Aristophanes* calleth it *ζωίδιον χρυσεόν κενόδαν*, a little creature of the colour of gold like a Beetle. *Eustathius* calls it a great Wasp, *Pollux* affirms it to be a little creature which flies, but sets not down its kinde. *Gaza* translates it *Galleruca*, but it hath nothing like it; and they who contend that it is a Tree-Beetle, have either lost their eyes, or cannot distinguish varieties of colours. *Hesychius* makes it a Beetle, but of a golden colour: as the Scholiast upon *Aristophanes*, yellow; later writers call it the greenish or Emerald coloured Beetle, but shining as it were with gold. *Marcellus Empiricus* intimates as much in these words: the green Scarabee (the Greeks call it *μυρολόγῳ*) is of a lively emerald colour, by reason of the pleasantness whereof, it is so delightfome and beneficial to the eyes, that they can never be weary of it; for the longer you look upon it, the more you would be in

love with it. *Pliny* also saith the same, l. 30. c. 70. & 29. c. 9. The male is green all over, except the eyes which are ruddy: the sheaths of the females wings (which is the bigger) seem to be of a chefnut colour, shining with a delightfome and beautiful brightness; otherwise it is like the male. The breast of them both stands out with a sharp point, which I have not observed in other Beetles. *P. Quicquelberg* an Apothecary of *Antwerp*, but one who was to be preferred before many Physicians for his studiousness about things natural, sent to *Pennius* a male and female of them, painted as it were with *Apollo's* hand. *Aristot.* l. 9. de *Respiratione*, ascribes to it a shrill sound, which perhaps gave occasion to some to call this the Tree-Beetle. They are generated (saith the Philosopher) *ἐκ τῶν σκωληκῶν ἢ ἐκ τῶν βοτάνων, ἢ ἐκ τοῦ ὀρίσου*, that is, of worms which are in corn-dungs, and of asse-dung. But *Stephanus* out of *Theophrastus* saith otherwise, *γινέται ἢ ἐκ τοῦ ὀρίσου ἢ ἐκ τῶν ἀνθίστων ἢ ἐκ τῶν ἀρχαίων ἀνθῶν περὶ πλάτων, &c.* The *Melolonthe* is bred of the blossoms of *Apple-trees*, or at least it flies to them when they begin to blossome. We are beholding to *Charles Clusius* for another kinde of this Beetle, whose feet are black, as likewise its head and shoulders, but from blewish. It hath horns in appearance, but not so indeed (wherefore we reckon it amongst the *antennae*, or hornless Beetle) its sheath wings seem to be furrowed: but about the edge they are some-

what red. *Thilesius* tells us of another notable kinde of *Melolonthe* (and I have here represented to you the figure of it) in these words: it is green all over, except the eyes (for those are exceeding black); its belly from golden is a little red, and so its thighs; the middle of its

R r r r

back

back is beautified with a half Moon of the same colour with its sheath wings; for which reason it is elegantly called by the Latines, *Equus Lune*, the Moons Horse. *Thilefus* writes that *Aristotle* makes mention of this, but I cannot yet finde where the Philosopher does it. *Thilefus* while he speaks of this among the Dung-Beetles (for which reason also I have added it to them) describeth it thus in verse:

*Which, rolling balls of dung this poster frames,
Some black, like the scorcht Moor are seen;
The nobler sort are deckt with green:
Whose back bath (to compare great things with small)
A mark, you may the half Moon call.
The English call't the Moons horse, so renown'd,
But had there e're so fair been found,
Many a Semiramis would love us then,
And Centaures had out numbred men.*

And indeed most of the Beetles are hideously black; yet I make no question, but some of them have their case shining with a blacker, others with a more pleasant green. There are also that shine like gold, and those very great ones, which dig up the earth, and make their nests there. Some there are which fly about with a little humming; some with a terrible & with a formidable noise, so that they would not a little fright one that is not aware of them. There are other differences also of shapes amongst them: but their breeding in dung, their feeding, life, and delight in the same, this is common to them all. Another Beetle of a purple colour was brought to us from *Constantinople*, which (only that its eyes, belly, and feet were like pitch) was all over of a purple and violet colour. The black one, which lives in dry wood, is formed after this manner: It is all over black, or russet rather, as if it were clad in mourning; its mouth is forked, its shoulders almost square, its legs and horns somewhat short; it seldome flies, but goes for the most part, and murmurs while it is going, as lewd servants use to do. The Tree-Beetle is very common, and every where to be met with, especially in the moneths of *July* and *August*, after Sun-set: for then it flyeth giddily in mens faces with a great humming and loud noise, and vexeth cartel. These Beetles spoil the leaves of trees, which they do not so much eat as tear in pieces out of an inbred malice; for they feed upon gnats. We call them *Dorrs* in English; the Dutchmen, *Baumkafer*, *Loubkafer*; *Jo. Agricola l. de subterr. Anim. Senkafer*; the French, *Hannetons*. The sheaths of their wings are of a light red colour, and covered as it were with a very fine flower, otherwise they shine but a little; their legs, feet, and prickly tail are of the same colour: its other parts are all over brown: only that the circle about their eyes, and their little horns are yellowish, and of the same colour are they a little above the beginning of their tail, the joynts of their bellies are whitish. In *Normandy* they are much more numerous every third year, and therefore they call it *L'an des hannetons*. It is recorded in our Chronicles, that in the year of our Lord 1574. on the 24. of *February* there fell such a multitude of them into the River *Severn*, that they stopt and clog'd the wheels of the Water-mills: and indeed, unless together with the industry of men, the Hens, Ducks, Goat-milkers, Castrels, Bats, and other Birds of prey (which seem to make these their dainties) had afforded their help, the Mills had even to this day been choaked with them and stood still.

There is another taken to be of kin to this, of a colour all over between brown white, its belly gray and as it were hoary. Of what use it is in Physick I confesse I know not. Fowlers indeed when they hunt for Ducks, bait their hook with two or three *Dors* or tree Beetles, and tye a heavey stone to their line, which they cover with flags, that their wiles be not discovered: the Duck for greediness of meat presently swallowes the hook, which sticking fast she is punished for her folly. How Cranes are taken with these wrapped up in a gourd, he that hath a mind to know may read *Gesner de Grue*.

The Beetle which *Pliny* calls *Fullo* is more rare, and not every where to be met with. It is not any where to be seen here in *England*, so far as I have heard or read.

read. *Gaza* sometimes translated that which *Aristotle* calls *αὐθαγὸς*, *Fullo*, whereas he alwaies intended that the Dung-Beetle only should be known by that name, and he gave proper appellations to all the rest. Neither can the Fuller-Beetle be called the red Beetle (as *Freigius* construe) nor is it a creature with a forked tail, which *Hadrian Junius* puts upon us for that *Fullo*: for the forked tail is

not of the sheath-wing'd kinde, as it shall appear more at large in the history thereof. This Beetle certainly is a fair one, bigger than the Tree-Beetle, but somewhat less than the female flying Hart: It hath a head almost horny, beautified with two little horns; its eyes and hairy breast are of a yellowish white, it hath feet coal-black; its belly and tail are like to Cranes feathers; its shoulders and wings are so beautifully wrought with black and white specks, that you would easily swear it were a cloathing of Damask embroidered after the Phrygian manner. Magicians say, that this Insect is a singular remedy against Quartan Agues, being bound to each arm, if we may believe *Pliny* l. 30. c. 11. *Pennius* first had the picture of it from *Carolus Clusius*; but *Quickensbergius* afterward sent him over the creature it self.

CHAP. XXII.

Of the lesser Beetles.

ALL the lesser Beetles are either spotted in their body, or unspotted: the Greeks call those *αὐθαγὸς*, divers coloured; and these *μοναγὸς*, of one colour. The spots of some of them are of a black colour inclining to white, others of them are yellow, others red. Of those that are white from black there are seven kinds, of the yellow ones thirteen, of the red ones twelve; which we have here ranked every one in its severall order.

Those that are unspotted, are observed to be all over of the same colour: and of them we have seen six blackish ones, two of a bright bay, one round, one of a skie colour inclining to black, another between yellow and black. And one was very lately observed by us painted with a light red, another seem'd drencht in the juyce of the purple fish. We have five which are as yellow as gold, very little ones indeed, but coloured

coloured all over with glittering gold, which, lest we should seem to have envied our posterity (the knowledge of) we have caused to be cut and described here. But for what use every one of them serveth, was declared when we spake in general of Beetles.

CHAP. XXIII.

Of the Oyl-Beetle, and the Water-Beetle.

IT is called *Proscarabeus* in Latine; in *Paracelsus*, *Moloe*; *Agricola*, *Pinguiculus*, from the fat sweat like honey which plentifully drops from it. The Greeks call it *αἰλαιόβατος* and *ἐλαιόβατος*; it is called by the Germans from the moneth which it is seen in for the most part, *Mayen Wurmlein*, and *Meyen Kafer*. Those of *Heidelberg* have put upon it the name of *Schmalts voghel*; those of *Dithmaria*, the names of *Ever* and *Kadden*, (*Wierus* testifies in his *Book de Morb. incogn.*) in English it may firly be called the *Oyl-beetle*, or the *Oyl-clock*. But why it is

rather called *Proscarabeus* than *Scarabeus*, contrary to the intention of *Gesner* and *Pennius*, I could alledge many reasons, but this especially, that they are distinguished in sex, and that they couple together. You see here the bigness of the female, and you perceive that it is bigger than the male, and for the most part of a diverse shape; for its mouth is not at all forked as the females is; this also upon the lightest motion or touch, runs with an oyl, (like liquid honey) the male is alwaies observed to be as it were dry. They couple, as we have often seen it in *Heidelberg* fields, tail to tail; the female in the act drawing to it the male (after the fashion of dogs) so that it is forced to creep backwards; they have both tender bodies, betwixt black and dark blew shining: upon whose shoulders there grow two wings, or rather beginnings of wings, as upon the *Estrich*, to help the swiftness not so much of its flying, as of its going; those circles that compass the belly and the back, appear green in the young ones, in those that are more grown, blew rather. If they be bruised, they yeeld a most pleasant smell, as *Taxites* affirms in his *Onomasticon*. it feeds especially upon violet leaves, else upon the leaves of tender young grafs. They are seldom seen but in the moneth of *May*; all the rest of the year they keep their holes, or having first wrapped up their seed in round bals of dung, they die. At *Heidelberg* and *Francford* we have seen many of them in the fields, in the pasture grounds, among the corn, and even in the very gardens and streets. But I have

found none yet in *England* alive and bred there. Only *Agricola* hath made them four-footed, whereas indeed they are all six footed, upon the mistake perhaps, or chance of having met with an Oyl-beetle, which had had two of its feet pull'd off. *Wierus's* Oyl-beetle, if you see it lie upon its back, seems (unless this old man makes sport only) to be made after the figure of a mans face. It hath gotten longer wings than the rest, and is marked with more rings or girdles going round its body: otherwise it differs not from that spoken of before. The most noble Knight

Sir Edmund Knivet affirmeth that he saw in England the former kinde of this Oyl-beetle, and sent us the picture of it; but could never finde that oily humour which the German one is full of. It comes short of this likewise in all its dimensions, either because it hath a climate, or because it hath a soyl less fit for growth. John Wierus writes thus of the use they serve for. In Dithmaria towards the south they hang the May-worm (for so he calls the Oyl-beetle) about the neck with a thred, especially in the moneth of May, when that moisture like hony (which is taken to be venomous) drops from it most plentifully: this Beetle (or sometimes two or three) being dried and beaten into powder they give with beer, puts the sick person into a sudden and great sweat either with labour, or with many coverlets upon the bed, or in a stove or oven after the bread is drawn. The eupon follow grievous symptomes, as a pain of the heart, an overthrow of all strength, a weakness of the whole body, which for the most part last no longer than half a day: this they repeat every other day, or every third day (as the case requireth) un-

till the ninth. This drink they call *Anticantharinum* or *Kaddentrunk*, because it is made of Oyl-beetles. And truly for that epidemical head-ach (which Placentius at the end of his Chirurgery, and *Berptalia cap. de Vapore*, and perhaps *Avicen. 4. l. 3. Fen. Tr. 2. c. 9.* do define) it is said to be an excellent remedy. The Saxons call this disease *Fiuren*, or *Kadden*. Paracelsus *l. 3. c. 6. de morb. Tartar.* recordeth that he cured a Dropsie by a medicine compounded of those Meloes and Radish seed: the making of it is after this manner: Take of Beetles called Meloes ten drams, Radish seed one ounce, make a liquor of it: the Dose may be from one ounce to three ounces, if necessity require. He used also *Oppodelton Meloum* against hand worms, *lib. de vit. longa c. 12.* which after other medicines he prescribed to be applied for the space of twelve hours. If they be taken before the rising of the Sun, and distilled (saies *Agricola*) they are very good for swellings under the eyes, if the places affected be washed every day three or four times.

That oily fatness also healeth the chaps of the hands, as we have heard of the Countreymen about *Heidelberg*, who have more than once commended their wonderful vertues to us. They do strongly expell urine, but withal, bloud. They close up veins, and nerves, and wounds; they thoroughly cure horses galls and bruises in the back which come by the badness of saddles.

Gasparus Reglerus l. de Peste, adviseth to gather up twenty Oyl-beetles, yet not with your hands, but with two little twigs: then being put into an earthen pot or glass, let them be smothered in as much of the sweetest Oyl-Olive as will suffice, and kept for use. He affirms that by being anointed with this Oyl Sores in the Groyn, Carbuncles, Pestilential Sores, Boyles, and wounds made by a mad Dog are cured. In another place he prescribes, that we should draw a circle about the sore with a Saphir stone, and then anoint the place with the oyl of Meloes, or of Juniper, as being that wherewith the venome is wonderfully drawn out, and the part affected presently reduced to its natural temper. *Marcellus Empiricus* mentioneth a certain hairy Beetle of the colour of a Lion, and like one indeed in all things else but his roughness. He contends that it is called by its proper name *Culio*; it is found in old hedges, and unregarded ditches and banks: this he writes is wonderful good for scabby eyes, and eye-lids which have been long fretted with a salt and sharp humour, or eaten away with lice. Thus he sheweth the way of using it: first gather betimes in the morning a colewort leaf wet with the dew of the night, and wrap it up so that all the dew run together to the bottome of the leaf, then having taken up his hairy Beetle with your fore-fingers and thumb, put it up instantly within the leaf, that its urine (which it presently makes upon its being bruised) may be mingled with the dew of it; for otherwise its piss, in which all the secret lieth will be lost.

If with a probe you shall search the eye-lids, and anoint the places, which are scabby and eaten away, with its dew when it is now impregnated as it were with the piss of this Beetle, you will confesse its strange and wonderful vertues. But what kinde or what manner of Beetle this is, I am altogether ignorant, nor can I call to minde any other Authors who have made any mention of it.

The Water-locks do now challenge to have some room allowed them, which the Greeks call *υδροδοκεις*; the Germans, *Wasser-kafer*; the English, *Water-clocks*. All these have their bellies coloured with a light red, and their backs coal-black, except that in England, in whose picture if you darken over all that border which compasseth about its shoulders and its whole oval body, and make its eyes of a silver colour, you cannot desire more toward its description. They have every one six feet, the hinder feet exceeding the others in length and bigness, which they use as it were for oars when they swim; under their sheathy wings which are very black,

lye hid their membranous wings of a silver hew, with which by night, having left the water, they nimbly fly through the air, which by day they very seldom (or never) use. But the least of all are those, which with a restless motion run about in a multitude this way and that way upon the surface of the water without order, and play as it were together, and when the water is troubled, either they dive down to the bottome, or hide themselves in holes of the banks: but afterward, as soon as the waves are still and calm, they leap about it again for joy. *Christophorus Lenssternus* writeth to *Gesner* that he found a Beetle in a certain place, with a sheathy crust (as they use to have) which had a head like an Ant somewhat yellow, and many wings, on the hinder part of the belly it had fins, such as are upon Crabs tayls, which they used as they wanded up and down (like rowers upon the water) it had a little tail sticking out for its defence, but which was parted into very long hairs, being thrown out of pond water into fountain water, it died within a few daies. And thus much of Beetles: which, of countreys only *Olynthus*, of plants only the wilde Lilly, produce not: whereupon that is called by *Pliny*, *Theopompus*, and *Antigonus*, *Cantharolethros*: this by *Dioscorides*, *Anticantharos*.

CHAP. XXIV.

Of the Fen-Kricket, the Eve-churre, or the Chur-worm.

GIVE me leave here where names are wanting to make some. The creature which we have described is that which *Cordus* calleth *Spondylis*; & *Dodonæus*, *Buprestis*, both of them amiss & without reason. For the *Spondylis* hath no wings, you see this Insect is winged. The *Buprestis* is said by all to be like the *Cantharis*; but this creature neither in figure, nor colour, nor bigness cometh any thing near it; to say nothing of its having no sheathy wings, which all wise men will grant the *Cantharides* have. [If we may make names, we may call it *Gryllotalpa*; a *Mole-kricket*;] a *Kricket* because it makes the same shrill

noyle which a *Kricket* doth towards night; a *Mole*, because it digs the earth continually; the Netherlands call it *Weemol*. It is an Insect ugly to sight and monstrous, four times bigger than the biggest of the *Cantharides*: especially when it is pretty well grown. The shape you see before you: I will tell you the colours. The female is paler, the male of a deep brown; that hath besides 2 long horns, 4 knobs hanging out as it were of its nostrils and lips; it hath also bigger eyes, and the root of its wings is bedecked with a red spot. But the male is without those buttons, and in stead of them hath two bristles twice as long as those buttons; it seemeth to be of the same colour all over, and without any spot; both their claws are as black as a Raven; with their fore-feet which are very strong and bending inward they both dig through hillocks, and make holes under ground; they stand upon their middle feet, and with their hinder feet, when need is, they leap; their tail is forked, their wings longer than their body, and membranous, their body variously jointed. The young ones for the most part are all over black, the old ones seem to be without hair: it liveth the greatest part of its age under a moorish and moist ground, yet in the night it cometh abroad. It is a very slow-paced creature, and its flying is like leaping; whereupon it is reckoned by some among *Locusts*. It begins to come forth as *Krickets* do when the Sun is going down, and pleateth it self with its singing, which is lowd enough and may be heard above a mile off; which as soon as the husbandmen hear, they are glad presently: as though they knew by its coming, that the earth now teemed with moysture, and were brought as it were to maturity by the heat of the Sun. It gathereth together grains of wheat, barley, and oats, and carrieth them into its nest, being to live upon them perhaps in the winter. Some affirm that it feeds upon Horse-dung. *Dodonæus* relates that this little creature kills cattel with its biting; falling into this mistake, because he took it to be the *Buprestis*. Whether it do any hurt being taken inwards I know not: but *Pennius* hath often handled it in his bare hands, and without harm, never observing in it any inclination to bite. Our *Bravernus* signified as much to *Pennius*, who hired Countrey-men with his money to observe as often as might be its condition, and to make relation of it.

CHAP.

CHAP. XXV.

Of the Fire-fly.

That which is called by *Ælian* *πυρρὸς*, other Greeks call *πυρρῆ*, *Hermolaus* *πυρρῆς*, some The
πυρρὸς. *Aristot.* l. 5. *Hist.* c. 19. giveth these little creatures no proper name, but sayes they are
δνεία, τὰ ἐν τῷ πυρὶ: which *Gaza* tranſlateth *Bestiales fornacum*, Furnace creatures. *Strabo* reckons them
among Gnats, they are called *πυρρῆα*, by *Suidas*, and by the *Scepticks*, as we read in *Laertius* l. 9.
Solinus calleth it *Caryſtia* l. de mund. Mirab. *Jul. Scaliger*, *Ignigena*; *Gaza*, *Furnaria*, and *Bestiola*
Fornacum, out of *Aristotle*, which he maketh bigger than the greater flies and winged: *Pliny* af-
firmeth the same l. 11. c. 36. *Antigonus* l. 10. *πυρρῆς*, ſaith from *Aristotle* that theſe Fire-flies
are bigger than Mice (not Flies only); where it is evident he ſouly miſtook *μῶν* for *μυῖων*, Mice
for Flies; which *Xylander* his Tranſlator took no notice of. In ſhape it is ſomewhat like a very
big Gnat, of a bright fire-red colour, glittering with a kinde of fiery raies; it leaps, goes, flies,
and lives in the flame, as *Aristotle* reporteth, l. 5. *hiſt.* c. 19. For I can ſcarce give credit to
Ælian l. 2. *Hiſt.* c. 2. when he ſaith that the Fire-fly as ſoon as it hath gone out of the place
where it was bred, and flown into the air for food, dieth preſently: for I cannot believe that
any thing bred in the fire, goeth out of its element to ſeek for food; nor is it likely that Nature,
that moſt loving parent of all things, ſhould preſcribe any creature ſuch a way of getting its food,
by which it ſhould preſently loſe its life. Neither is it, as it ſeems to me, ſo hard to finde out
the reaſon of this their ſudden dying in the air (which *Ælian* leaves to be ſearched out by
others) for being bred in the extremity of heat, how ſhould they live in a temperate place?
For it is evident by daily experience, that ſome Fiſhes dye as ſoon as ever they are taken up out
of the water into the air; much leſs can thoſe creatures that are bred in the fire, endure the air,
ſince it differeth ſo much from the air, and indeed more than the air from the water.

Theſe Flies are bred in the Braſs Furnaces of the Iſle *Cyprus*, where the *Chalcitis* (or Braſs-
ſtone) is burnt for many daies together: perhaps the ſooty vapours which go up with the flame,
while the ſtone is continually burnt, are the matter and cauſe of their generation. *Strabo* ſpeaking
in his 12 Book of *Wornis* bred in the ſnow, addeth this which followeth: *Τὴν δὲ γένεσιν οὗ δαίμονος*
ποιῶν τὴν εἰς τὴν, διατὶ τὸ πῦρ καὶ τὸν ἀέρα ἐν τῇ ἐν τοῖς μεταλλοῖς φλόγῃ καὶ τῇ πετάλῃ: They con-
jecture that the generation of theſe creatures is like that of Gnats, of the flame from metals and
plates of braſs; where any man may ſee the error of the Interpreter, for he renders it thus:
Horum animalium generationem talem putant, ut culicum ex flammâ & bractea metallorum. For
they are bred in the flame (as *Scaliger* ſaith) not in *maſſa*, that is (as I interpret it) in the fire
which is condensed together: nor doth any thing forbid but that the moſt dry animals may be
generated in the moſt dry element (for there is mixtion there alſo) as the moiſteſt are in the
moiſteſt; for we have no pure fire with us. But what hinders but that living creatures may be
generated of matter ready for them, or what natural reaſon contradiceth it? They answer, that
fire deſtroyeth all things, corrupteth all things. But they which have had but any taſte of the ſe-
crets of Philoſophy, do evince that to be falſe by clear demonſtration and experience. For ſo
far is our fire from deſtroying or corrupting all things, that it even perfecteth ſome. It
doth not corrupt nor conſume gold, nor ſome ſorts of met ls, not aſhes, not the ſtone *Amiantus*
which is very like *Sicil Allum*; nor ſome other things which I will not now ſtand to reckon up
for thoſe froward mens ſakes. What then ſhould hinder fire from having the power of generating,
ſo it be in a fit and convenient matter? its very diſineſs cannot hinder the generation from coming
to effect; becauſe it proceedeth from the form; but fire is the matter and the forms inſtrument for
ſome operations. Beſides, our fire hath alwaies ſome moiſture joyned with it; for it would not
take flame nor burn, if it were not cheriſhed with a ſat moiſture; for certainly thoſe things are nei-
ther without earth nor water, which are generated in our terreſtrial fire. *G. Agricola*. But if this
were not ſo, becauſe fire prefers not; yet there is no reaſon we ſhould doubt but that generation
may be effected by the fire, as by the form in its proper mat-*ter*. For unleſs there were moiſture in
metals, they would not melt; what therefore ſhould hinder nature, but that it may give this a
form? *Aristotle* maketh the queſtion, Whether in the ſphere of the fire (which is next to the
Moon) there be generated any living creatures? and he ſeemeth to be in doubt, and putteth off
the queſtion until another time; but when he affirmeth that the Fire-fly is generated in this fire
of ours, I ſee no reaſon, why any ſhould doubt of it: yet there are ſome very learned men, and
eminent writers of our time (who ſeem nevertheleſs to excel rather in wit, reading and language,
than in the ſolid knowledge of things natural) who condemn and reject not only the generation
of theſe little creatures in the fire, but this whole hiſtory as frivolous, falſe, and unworthy of a
Philoſopher. My readers expect now, that I anſwere theſe mens arguments.

They object that *Aristotle* doth in plain terms affirm, that the fire produceth no living crea-
ture. The Philoſopher doth there compare the heat of ſeed with the heat of fire, affirming that
there is not a fiery heat in ſeed; for (ſaith he) if there were, it would produce nothing. But this
hinders not, but that a living creature may be generated in the fire without ſeed: but of ſome
other fit and convenient matter, as we ſhall ſee anon. Beſides, the Philoſopher ſeems here (as

like-

likewise elsewhere) to speak of that fire only which is under the sphere of the Moon, that that produceth no living creature; not of ours, where there is both mixture, and no pure fire. But they yet urge: Our fire is *Substantia λεπτομερής*, a substance of most subtil parts, and seizeth upon all things that are in its way, devouring them and turning them into its own substance. This was answered before when we instanced in some things which are rather perfected in the fire, and which fire is by no means able to consume or turn into its substance. *Jo. Langius* (a man of much reading, and a most learned Philosopher) and from him *Cardane* grants that some Animals may live in the fire, but not that they can be bred there; for in this they yeeld to the Philosopher. But who seeth not how absurd this yeelding is? for I cannot see how things generated in a temperate place, should be able to live in that extreme. For that which they say of the Salamander, is as good as nothing. The Salamander (as *Diosc.* hath observed) doth not live long in the fire: for as soon as that moisture, which runneth down on every side from its yellow spots (as I conceive) while it staies in the fire, is consumed (which is quickly done) it is presently brought to ashes, as *Pennius* hath made trial with our *Brueus* in the Countrey about *Heidelberg*. *Erastus* a most learned Physician, disputing about rotten Feavers, endeavoureth to overthrow all this History with these arguments. First, because *Aristotle* compileth the History (saith *Erastus*) who, it is confessed, writ many things from hearsay; I grant it: but then he adds, *ut aiunt*, as it is reported, or some other word of the same importance (as *Niphus* hath well observed) even as in that very place, speaking of the Salamander, he addeth, *ὡς φασιν*. We may observe that this is the constant practise of the Philosopher, when he speaks according to the opinion, or from the relation of others; but grant it were so, that he from others related it; they were deceived (saith *Erastus*) who related it to him; imagining those creatures bred in the fire, which fell by chance into it. But the circumstances of the place make it appear that this is false. If they had fallen from elsewhere into the fire, surely by his own confession they would be consumed by the fire. And unless they had been bred there, (as I said before) how should they be able to live in such an extremity of flame? Besides, spectators have observed the motion of their feet, the number of their wings, their flying, yea their death, and the cause of their death, *viz.* their flying somewhat too far out of the fire. These things and the like evince that those relators were not at all deceived, but that they related what was true and unquestionable. But no Author either before or since *Aristotle* affirms this, but one or other perhaps who hath transcribed it from him. This is more (*Erastus*) than you know, you have not read all Authors Books: the greatest part of books is lost, as it appeareth plainly out of *Athenaus*, and Histories bear witness. But how I pray you, came *Pliny* to be assured that Fire-flies have four feet? He did not learn this from *Aristotle*, nor is there any such thing to be found in his writings which are extant. Wherefore either he learnt it from others, or else the History was known in *Pliny's* time. *Pliny* therefore added this, that he might make up the History compleat. Nay, if you had read *Cicero l. de Nat. Deo.* you had found him affirming for certain, that there are little winged creatures bred in the middle of the fire. Neither did I before think you so ignorant in Theology, as not to know what *S. Augustine (l. de Civit. Dei 21. c. 2.)* hath observed of these *Pyribia*: There are, saith he, creatures which live in the midst of the fire; and there are found some worms at the Spring-head of hot waters, whose heat no man toucheth without harm: while these remain there not only without receiving any hurt, but are not able to subsist out of them. And *Vincentius hist. Nat. l. 20. c. 68.* In some waters which are naturally hot, there are certain Worms which live as well as Fishes in cold: nay if they go out of those waters into cold they die. *Solinus* also confirmeth it c. 17. who calleth these kinde of Flies *Carystia*, and reporteth that in *Crete* they fly into hot furnaces without harm. Yea and *Seneca (quest. natural. l. 2.)* affirmeth that some living creatures are generated of the fire; and therefore these Fire-flies likewise; as lately *Marsilius Cognatus* teacheth us in a large Discourse, *Variar. observ. l. 1. c. 23, 24.* Do not then any longer contend, that no Author either before or since *Aristotle* affirmeth it; since besides these pious and grave men already named, I can bring others also, who would convince you either of plain falshood, or of a levity not hard to be discerned. But *Theophrastus* maketh no mention of it in his Book *de Igne*. What do you conclude, *Erastus*, from thence, that the History is false? Very fine. Perhaps he beleev'd it not; is it therefore false? But it is probable. I grant it. There are many things probable, and yet false, as experience teacheth us. *Erastus* wrote many things against *Paracelsus* which are probable, yet not all true, unless those things which he understood not, be true. Certainly he endeavoured to confute many things, which I know he never understood: I will not now descend to particulars. Well, but the heat of fire is not *πῦρ*, fit for generation. This, *Erastus*, you apprehend not; but I told you before, that if it were in the feed, it were not, which was the Philosophers meaning. For it is *φθαρτικόν*, *corruptive*, according to *Aristotle*: But I answered before, that fire doth not corrupt all things. This barrenness therefore, or (if you please) destructiveness of the fire is to be limited. Nor truly do I conceive this to be done miraculously, but by the power of Nature; neither do I take it for a tale, but for a History agreeable to nature. And as for what he writeth of the Salamander, he adds *ὡς φασιν*, as I said before: there was no need to add it. But I beseech those who believe nothing but what they see, to tell me, Have any one of the ancients found fault with this History, or confuted it? I speak of the Greek writers. No, not so much as *Galens*, who otherwise is a most sharp reprehender of the Philosophers, and would have laid hold on this instantly, if he had had any

any such opinion. Therefore it is likely that the history is true, because none of the old writers found fault with it. But come we now to *Matthiolus*, who of all men hath contradicted this History most unhappily; for in his margent he inveigheth against the vain opinions of the Philosopher (as he thinks) where he appears in some things vainer than vanity it self. But I will return to the business. It is against (saith he) the work of nature. Is it enough for *Matthiolus* to say so, though he prove nothing? If the story had been true, *Galen* would never have omitted it, who hath searched out all things else so diligently, furnaces, and metals, and what not? *Julius Scaliger* will make answer, to what end should he repeat a thing known before? Sooner would he (as he was a famous and a malicious detractor) if he had not found it so, have reprehended it, as he doth in some places make it ridiculous. He which continued so few daies, did not understand the whole matter; they were not, they are not alwaies at hand; he never enquired of the Bakers. But if I should say that a little she colt newly foaled should have plenty of milk in its udder, and that it did issue forth in great quantity, what would they say then? yet nevertheless I saw it at *London* about six years since, as also many others of good note and credit, who with their own hands did milk it out of its teats. They will say perhaps, we do not believe it; let then chuse, it makes not much to the matter; there are many productions of nature, the causes whereof it is impossible for any man to know, much less to shew to others. And that certainly not without great reason, that we might both admire the infinite power of God, and acknowledge our own blindness and ignorance. For these and the like did God create only for his glory, that he might both confound the shallow understandings of men, and also learn them to acquiesce in his wisdom only, for so much as in searching out the natural causes of things, it is impossible to go any farther. For this is amongst the works of God that may pluck down our ambition, and makes us with all our wit to fly to that common Anchor of fools, namely hidden causes and the whole substance. What have we then to do? surely only to apply ourselves unto him, from whom all wisdom, knowledge, and perfection doth proceed: for whilest we rely on our own wits, and do pry into the Majesty of God, we must needs (as *Solomon* in his Proverbs speaketh) be confounded by the same. What then remains? this surely, that they which think these things to be impossible, do keep their opinion to themselves, without meddling with those that think the contrary.

The Author of the *Geoponicks* (if I am not deceived) calls this little animal a Salamander: his words are these: *Σαλαμάνδρα τὸ ἐν πυρὶ ζῶον ἐν τῷ πυρὶ ἔχει μέσσην, &c.* that is to say, *The Salamander that little creature is begotten in the fire; and living in the fire, is not consumed by it.* Here he tells three untruths together. For neither is this the least of creatures, but oftentimes bigger, sometime less, neither is it generated by the fire, nor doth it live long in the fire, as I said before, out of *Dioscorides*. Thus much I thought good to add, lest young students reading those *Geoponicks* should erre so foully with *Zoroastes*. For what purposes it serveth, I cannot boldly say: yet by its place of growth and principles it seemeth to dry and cleanse powerfully. It is also of very thin parts and body; it pierceth to places very distant: and truly if the Grasshopper which feedeth upon air, be of so burning a faculty; what shall we think of the Fire-fly, which eateth and drinketh flames? But the Fire-flies are of this use to our mindes: they represent to our understanding the wonderful power of God, who hath made the greatest of all the Elements, Fire, subject to so small, so dry a creature: vouchsafing to be vanquished by these while it scorneth, I do not say to be vanquished (to use *Majolus's* words, *Dier. Camic. Colloq. 5.*) but even so much as to be touched by men, or the greater Animals.

CHAP. XXVI.

Of the Water-Spider.

THE Water-Spider is next, a little creature of exceeding nimbleness, whose History Authors have so slightly handled, that we can hardly pick out any thing of weight or moment towards the illustration of this History: we shall yet perform what we can.

I utterly deny *Arges* in *Aristotle*, to be the same with *Tipula* in *Plautus* (as *Gaza* interprets it) for I am not periwaded that Mule-gnats can come of them.

It is called in Latine *Tipula*: *Plautus*, *Festus*, and *Nonius Marcellus* write it *Tipul*; others, The Name, *Tipulla*; *Guillerinus de Conchis* reads *Tapula*; *Albertus* and *Vincentius* in his *Speculum*, call it *Tappula*: none of them aright. By *Plautus* it is called *Tipula*; in Greek (as I found in *Gesner's* papers) *πῖβλαν*, which word truly I finde not any where any footsteps of, nor can I tell what it properly signifies; some High-Dutch call it *Wasser-gems*, which is to say, a Water-goat; others *Wasser-spin*, which is a Water-spider; the Nether-lands, *Wasser-spinne*; with us it is called the *water-spider*, as with the High-Dutch and Netherlands, for likeness sake; in Spanish, *Gusano que corre sopra el agua*, a worm that runs upon the water; in Italian, *Capra di acqua*; in Polonian, *Wood ny cieluck*.

There are two sorts of Water-spiders, the greater and the less. They differ in bigness only, or perhaps in age: the greater are more common in coldest waters, the less are somewhat more blackish and of a more compact body.

Sfff

The

The greater more inclines to an ash-colour, being of a larger body.

Although severall men write severally, and neither tell any certain marks whereby it may be known, nor agree in the number of its feet, yet I hope we shall so clearly and perspicuously explain the History of the Water-spider, that there will be no occasion of doubt left hereafter.

The Description.

The Water-spider is a little creature, in shape very like a Spider, of a body somewhat long and slender: it hath four feet fast to its breast, and two little armes stretched out before near its mouth, perhaps in stead of horns; which if you reckon with its feet, it will have six feet: which yet (so far as we could observe) it useth not when it runneth: they are as short again as the rest of its feet, neither have they any knots or joynts like the other feet. Therefore *Albertus* and others allow but four feet to the Water-spider: but *Festus* six, reckoning these little armes together with its feet. It hath four wings, very feeble ones, which seem not to be made for flying, but for leaping. They are shorter than its body, and the uppermost of them a little thicker and larger than the others, but yet not of leather (like those sheathy cases) they are between a brazen colour and a black; the inner wings are lesser and thinner, and of a silver colour. Whether they fly by night like Water-beetles or no, we are uncertain; they leap sometimes upon the water so lightly, that they scarce so much as stir the surface of it. Hence grew that proverb among the Ancients, *Lighter than a Water-spider*. So *Pierius* being to express the lightness of men; and *Virgil*, the nimbleness of *Camilla*, compare them to the Water-spider. *Plantus* likewise in his *Persa*, *Neq; Tipula levius est pondus quam fides lenonia* (for so *Lambine* reads it, against the consent of all copies, even that of *Nonius*) *A Panders honesty is lighter than a Water-spider*: It runneth not in a continued course, but with intermission. It goeth not under water, but when it is driven thither by force: its body is never wet. They are found all the Summer time in standing waters and ponds which are free from the wind, and quiet: sometimes also they are met with in rivers, especially close by the banks of great rivers, and for the most part under the shades of trees (as of the willow, or any other tree, (which is not over tall): most commonly multitudes of them are together in companies. They are seen sometimes to couple leaping on one anothers backs, but they make an end of engendering very quickly. One shall hardly finde any one of them in Winter.

Their Use.

Whether they be of any use in Physick, besides the common use Flies are of, we leave for others to make experiment: for we know of none; nevertheless we utterly deny that these little creatures were brought forth by nature to no purpose. Certainly the Gudgeon, the Rochet, the Pearch, and other inhabitants in the dominions of the waters do sufficiently declare how useful they are for the feeding and fattning of Fishes. Without question *Festus*, *Nonius*, *Marcellus*, *Sipontinus*, and others, meant this Water-spider now described, as it will appear by their words. The *Tipula* (saith *Festus*) is a kinde of little creature, having six feet, but so light, that in running upon the water it seemeth to take no steps. *Peritius* saith upon the matter the same. The *Tipula* (saith *Nonius Marcellus*) is a very light creature, which doth not swim but go upon the water. *Varro* thus: *Levis Tipula levissime frigidis transit lacus*: for so the place which is corrupted, is to be read and corrected: *The light Water-spider very nimbly passeth over the cold ponds*. *Albertus Guillerinus de Conchis*, and *Vincentius* call it *Araneus Aquaticus*, interpreting the Dutch name (for it hath some likeness with the Spider) ascribing but four feet to the *Tipula*, not reckoning the little arms which are before, among its feet, since it doth not use them in going. Others (as I said before) reckoning those little arms among their feet do allow Water-spiders six feet. Hence it does most certainly appear, that we have described that very *Tipula* which *Plantus* mentions, so that there is no room left for any ones doubting hereafter. But before we go any further, the truth requires of me, that I confute two notorious errors of *Guillerinus de Conchis*. The first error is, when he saith that the Water-spider lives alike upon the water and upon the land: the other, when he saith, that it runneth very swiftly upon land; both which do evidently contradict experience: for upon land it doth not live long, nor run at all, but move with a very slow pace, and sometimes leap, but that very little.

Whether *Catrab* in *Avicen*, which is called by *Sylvaticus*, *Cutubut* and *Eckentubut*, be the Water-spider (as *Wierus* thinketh) I cannot say for certain: although indeed I am easily perswaded by reason of the circumstances, to believe that *Catrab* in *Avicen* is not the Water-spider. But let us hear *Avicens* description: *Catrab* (saith *Avicen*) is a little creature having its being on the surface of the water, which moveth upon it divers waies without order, and diveth ever and anon to the bottome, and presently appeareth above again. *Sylvaticus* hath almost the same word for word: only he adds, that whensoever any thing happens amiss to it, it runs away, and by and by appears again. From this little creature by reason of its restless and disordered motion, hither and thither, that kinde of melancholy which the Greeks call *λυγερθραπία*, the Latines *Insania Lupina*, is called by *Avicen*, *Catrab* and *Alcatrab*; with which when men are taken, they fly from the living, and go out by night, and frequent graves (as *Paulus* writes) and think indeed that they are turned into Wolves, as *Wierus* writes it befell a certain husbandman in Germany in the year 1541. The Ancients (saith *Wierus*) call a fly which is common in moorish grounds, *Tipula*. And we think *Manardus* made mention of this somewhere in his Epistles. Wherefore I am fully perswaded that *Catrab* is not this Water-spider, but some other little creature,

creature, the least of the kinde of Water-beetles, which with a restless motion moveth almost continually upon the surface of the water higher and thither without order (as we said in the History of them) and upon the least disturbance or stirring of the water, goeth to the bottome, and presently hideth it self in the mud, but by and by as soon as the billowes are down, riseth up again to the surface of the water. This little creature is seldome single, but many of them sport together in the same place, running up and down severall waies. I was once wont to behold with great delight these little very black and shining Beetles pulling one another, and as it were wrestling together. But of these we have spoken at large among the Water-beetles. And we shall take *Gaza's* Tipulæ into our consideration among the Water-worms.

The word *Ascaris* which they interpret Tipula, maketh nothing toward the illustration of this History.

CHAP. XXVII.

Of the Forficula, or Earwig.

Arnoldus his *Forficula*, is called by the later Latine writers, *Auricularia*; by the more Ancient, *Mordella*: *Niphus* calls it *Vellicula à vellicando*, from rending; the French call the Earwig *Aureilliez*, or *Perceauraille*; the Germans, *Oren-worm*; the Low Dutch *Orenmetel*; the English, *Earwig*. *Hadrianus Junius* thinks it to be *Fullo*, which notwithstanding much differs from the form of a Beetle. Is this the Greeks *ἰσχυρὸν*? truly both the original of it and the biting agree thereunto; for this is bred also in the hollow stalks of herbs, (as of the wilde Parsnip, Angelica, Fennel Gigant) and is frequently seen in Coleworts. The Northern English by an obscene name call it *Twich-ballock*, as if you would call it *Scrotomordium*, or *ἰσχυρὸν*, for where ever it findes a rivled pleated skin, it will cause very great pain, either by biting with the mouth, or by winding about it with its forked tail; which *Pennius* saith once hapned to him being a boy. For we fell upon two sorts of Earwigs, both were with wings, contrary to the opinion of many. For if you force them here and there back again with a bull-rush, when they are hem'd in in some place or upon a table, (which the most illustrious *Knivet* taught *Pennius*) they will presently open their wings that are hid under their covers, and fly away. But you must take diligent heed that you press it not too hard with a straw or or rush, or wound it, for then if it would never so fain it cannot fly away. The more common is seen with a light

The Name.

The difference and description.

red colour; his foreyards, feet, and forked tail are yellow. The other (which is more rare in *England*, and was seen by me but once or twice) is greater than the former, and of a blacker body, hath a silver ring about the neck to adorn it; the outward covers of the wings are of a reddish colour: the mouth is forked and yellow; on the back on both sides near the sides, there arise five yellowish spots, the fork of the tail is short and black, and she lifts this toward her head and flies, being angry, into the air.

They are oft found in Coleworts and hollow Reeds, and in the little bladders of Elm leaves. They breed of worms that breed in the stalks: they yearly cast their old skin, and that being gone they look white as snow. But with age it growes again, and is died with its ancient colour. The English women hate them exceedingly, because of the flowers of Clove-gelliflowers that

they eat and spoyle, and they lay snares for them thus: They set in the utmost void places Ox-hoofs, Hogs-hoofs, or old cast things that are hollow, upon a staff fastned to the ground, and these are easily stuf with cloathes or straw; and when by night the earwigs creep into these to avoid the rain or to hide themselves, in the morning these old cast things being suddenly taken away and hook forth, a great multitude of them falls out, and are killed with treading upon them.

Arnoldus Breviar. 1. cap. 25. bids us to boyle them in common oyl, or oyl of Hearts-ease, and with that to anoint the arteries of such as are in a Convulsion, both their temples and wrists, to cause a Feaver, which is a remedy for a Convulsion. *Josephus Michaelis*, an Italian and a famous Physician, is wont to collect a great number of them, and to bring them to a fine powder in *Balneo* in a glasse very close stoppt. Then he mingles as much powder with Hares pisse, that he may pour into the ear morning and evening. He often protested to *Pennius* that this was a secret to cure deafness. Others mingle the powder with oyl of Cloves and use it as before. The smaller *Gallinago*, (which the English call a Suite) and Hens feed on Earwigs: and I well remember that I have found a great number of them in their Mawes.

Their Use.

CHAP. XXVIII.

Of the Scorpion, the Ant, and flying Lice.

L. II. c. 25.

The Name.

Aristotle 4. de partib. c. 6. denieth that Scorpions have wings; Scorpions (saith he) move not flying, but going. But latter ages since him have seen and acknowledged some of them to be winged. Apollodorus (witness Pliny) relateth that some of them for certain have wings, which Nicander also hath recorded. Panjanus in Bætic. speaking of winged Serpents, hath these words: Neither ought any one to be too forward to believe those things, which Nature more rarely representeth; nor yet to be altogether incredulous concerning them: I never saw any where flying Serpents, yet am I easily perswaded to believe that there are such, because a man of Phrygia lately brought into Ionia a winged Scorpion of the Locusts kinde. Paramenes also l. de Best. Venenatis in Egypt. reporteth that he saw, not with other mens eyes, but with his own eyes, Scorpions with wings, and armed with a double sting in their tail. With whom Alian agreeth l. 16. c. 42, 43. Megasthenes hath recorded that there are some in India among the Prasii, which have wings, and are *σπερμάντεις μύδισσι*, exceeding great ones. In Africk likewise there are some winged, and others without wings, having seven joynts in their tails, saith Strabo l. 15. Geogr. & l. 17. The Psylli (saith Pliny l. 11. c. 25.) have often endeavoured to bring them over into Italy, but they were not able to live beyond the climate of Sicily: yet there are seen of them sometimes in Italy, but harmless ones, and in many other places, as about Pharos in Egypt. We read also in the History of Navigations, that Ambolus the Portugal, while he stayed at Palimbrotia (it is a City situate by Ganges towards the East, and according to Diodorus Siculus built of old by Hercules) saw there great store of winged Scorpions. It might be called in Latine, *Nepales quasi Nepa alata*, for so Plantus calls the Scorpion in *Casina*, when he saith, *Recessim cedam ad parietem, imitabor nepam*. So again Cicero 5. de Finib. *Nepas aculeo uti videas*. Varro also and Columella do very often call the Scorpion by that name, although Festus understand by it a crab. Nonnius writeth that that name was borrowed from the Moors, by whom Scorpions were first called *Nepa*, and brought into Italy. Thou seest

here its ordinary bigness and shape; It is of a colour very like honey, whereupon it is called *μελίχλωρος*. The last joynt of the tail in this kinde is black, armed with a double sting, as if one could not do mischief enough: it hath wings like the mandible of the Locusts, it goes obliquely and after the manner of a Crab; it is very hurtfull to men, especially to young men and boyes. Alian attributes to it a glittering red colour, and calleth it flame-colour. Its poyson being hot, causeth extream heat; which happeneth otherwise in the Scorpions which have no wings. It kills Lizards, Adders, Spiders,

Whirls, and all kinde of Serpents, Alian. l. 8. c. 13. This kinde of Scorpion likewise being applyed to a wound made by it self, healeth it, as others do: and if the smell of one of them burnt come to other Scorpions, it driveth them out of a house.

Its Generation is after the same manner with theirs that have no wings, of which we shall treat at large in the second Book.

The Ant is called by the Latines *Formica à ferendis micis*, from carrying grains of corn, saith Isidore. The Greeks call it *μύρμηξ*, *μύρμηξ*, *μύρμηξ*, *βορρᾶνα*, *δρῆμα*, and *φέρμυξ*, by Hesychius and Varinus; it is called in Hebrew, *נמלה*; in French, *Fourmis*; in English, *Ant*, *Emmet*, *Pismire*; in Spanish, *Hormiga*; in Italian, *Formica*; in the Slavonian and Polonian Tongues *Mrawenecz*; in the Illyrian, *Mpowka*; in Low Dutch, *Miere*; in Flandrian, *Labnets*; it Dutch, *Omay*, *Ommes*, *Eims*. Now some Ants are winged, some without wings. One of the Greeks call those that are winged (of which only we treat in this Book) *μύρμηξ*; another calls them *σέφρος*; they are named by Aristotle *ἰσπομύμνους*, and simply *ἰσμίς*, l. 1. de Anim. part. by the Latines *Equites*, because of their exceeding swiftness, wherein they excel the others. They are of a larger body and bigger limbs than those that go and have no wings, (whereupon Pliny, if I mistake not, call'd them *Herculane*) and of a middle colour between black and swart: they have four silver coloured wings; their uppermost bigger and longer than their whole body; their inner wings half so big. I have nothing that I write for certain, concerning these Indian flying Ants. For Authors themselves are uncertain, and many late writers, having travelled over almost all India on foot, have yet found none of those gold-horders and devourers of flesh; Of which Megasthenes hath recorded thus much: There are found (saith he) among the Darda certain winged Ants no less than Foxes: Now the gold-stealers understanding that they feed upon the flesh of wilde beasts, strew pieces of it along the waies, and so while the Ants are overbusie about their meat, they take away without danger all the gold they had all this while stolen. Onesicritus writeth that he saw some of their skins like Panthers skins. The Book entituled *De Natura rerum*, so describes this winged creature, with hooked claws, a winged body

body, and a crooked beak, that one would take it for a Griffin rather than an Ant. That *Ethiopia* also breeds such, we read in *Philostratus*, who placeth Ants and Griffins also in *India*; which are not very like one another in shape, but both trusty keepers and diggers up of gold. The horns of the Indian Ant, set up in the Temple of *Hercules* at *Erythra*, were a wonder, as *Pliny* witnesseth, or rather lieth. He that desireth more dreams concerning them, let him read *Herodotus*, *Arrianns*, *Tzetzes*, *Strabo*, *Ælian*, and *Pliny*, who gave so much credit to lies carried to and fro and entertained, that they were not ashamed to put them down even for truths. But passing over the *Indian* Ants, let us treat of those in *Europe* only; whose course of life, fights, victories, policies, prudence, sagacity, parsimony, cunning, frugality, industry, æconomy, charity, fidelity, civility, valour, and laboriousness I would to the shame of men represent here; but that it would be necessary to repeat the same things in the second Book, when we shall treat of those that go, with which they agree in nature, and belong to the same Common-wealth. With these *Herculean* Ants bruised, and Salt and Pepper put to them, the Manginess, the Leprosie, and the Scurfe are cured. *Plin.* Oyl made of winged Ants, provoketh and strengtheneth *Venus*. *Wecker*. To conclude, whatsoever diseases other Ants are good for (and they help very many, as you shall read) the winged ones have the same or greater vertue in curing of them.

The medicinal use.

The way to make the Oyl is found in *Rhasis* and *Barthol. Montag. l. 5. tract. 18. c. 7.*

Agatharhistes tells us, that the *Acridophagi* or eaters of Locusts are not far distant from the inhabitants of the Red sea: which nation are of a lower stature than others, lean of visage, and extreame black. About the Vernal Æquinoctial, when the South-west and West winds blow with the *Italians*, an unspeakable multitude of great Locusts is brought to them with those winds, out of some place unknown, which differ little from birds in their faculty of flying, but in the shape of their body very much. With this sort of creatures they are nourished all this season, feeding upon them salted or otherwaies drest. And they catch them by fetching them down from the air to the ground with a smock. And these people are reported to excel in nimbleness and swiftness of foot: but taking a very dry nutriment, they do not prolong their life beyond forty years, nay and dye more miserably than they lived; for when old age drawes nigh, there breed in their bodies certain sorts of flying Lice, in figure indeed like Dog-flies, but otherwise less; they begin at the breast and the belly, and in a short space eat up all the skin of their face. Others of them are taken like those which have the Itch, thereupon they tear themselves grievously, and at length the disease being at a stay, and thin humours running at the coming out of these little creatures, they are fain poor wretches to undergo intolerable torments: and so by reason either of ill humors, or of their feeding, or of the badness of the air, they die. *Hieron. Mercurial. de morb. cut. ex Diodoro Siculo 4. Antiq. lib.*

CHAP. XXIX.

Of the winged Punie or Wall-Louse.

When I had resolved to conclude this History of winged Insects, we had three wood Wall-lice of the sheath-winged kinde brought to us, which we here represent upon their backs, and upon their bellies. The back, the neck, the little hornes, and the sheathy cases of the first are of the colour of a Leek; its wings which are longer than its sheathy cases, are between green and yellow, as also its eyes and feet. The second is of a swart colour all over. The third hath its body variously coloured with black and red; its little hornes and feet coal-black: all of them do glitter here and there with a golden brightness (which *Pennius* observed not) and seem to be of a very compact and tender body. They are found sitting most commonly upon Mallowes, sometimes upon other plants and trees that bear Apples like Pine-apples, as likewise upon the Elm and the Willow. They copulate in the moneth of *May* tail to tail, and are almost a whole day about it. The male is less, the female bigger and broader. They fly in the heat of the day fast enough, but neither long nor far. There are bred with us (saith *Cardane*) in the grass two Animals like Wall-lice, the one in smell but not in shape; the other in shape but not in smell: but neither of them is of the species of Wall-lice, because they both fly. *lib. de variet. rer.* But he that shall observe their stink and outward shape of body, will not turn them out of the family of the Wall-lice, for their wings sake: although indeed the field kindes are six times as big as those in houses. *Jacobus Quicquelbergius* sent two other kindes of them to *Pennius* from the parts about *Vienna*, which were waved with a golden and black colour. *Matthiolus* not at all understanding

SSSS 3

Pliny

**Their Medici-
nal use.**

Pliny, denieth that they have any vertue in them. But *Pliny* many waies commendeth the garden Wall-lice, being reduced to ashes and infused in oyl of Roses, against pains of the ears. *Palladius* useth these with the Lees of Oyl, an Oxe Gall, Ivy-leaves and Oyl, for an oymntment for the birings of venomous Horseleeches. Let the head of the yerd be put into Oyl of Camomil pretty hot, in which Wall-lice have boyled; then let the head of the yerd when it is taken out of the oyl, be anointed with pounded Garlick, and the patient will certainly make water. *Arnoldus de villa nova l. 2. Breviarii, c. de stranguria & dysuria.* Are not these to be taken for those Wall-lice, which the Dutch call *Knolsters* and *Qualsters*? And hitherto hath been said what we know of winged Insects: ye *Ptererus's*, *Camearius's*, *Clusius's*, *Quickelbergius's*, and ye later and more laborious sons of *Esculapius* (whom *Phœbus* moulded out of richer clay) if you have any thing which is here wanting, make addition of it, according to your wonted courtesie and ingenuity, remembering that of the old Poet:

Καὶ δὲ π, καὶ λάβε π· ἄρτοι αἱ Μεσῶν θυγαί.

When you receive, you ought to give withall:
The Muses gates are wide, and liberall.

OF

Of the Division of the Second Book.

The Preface.

BY the clew of *Dædalus* we are at last got out of the Camps of winged horsemen; where should I relate with how many stings the Insects of the lower ranks have assaulted me, how much they have troubled my brain, my right hand, my eyes, whilst I accurately dissected and observed all their parts, truly I should either faint in rehearsing the wounds, or what I was resolved in my minde to finish, I should not be able to do. Wherefore, what valiant souldiers are wont to do, whilst the wound is yet fresh and hot, we will break forth into both Armies, and with better undertakings, so far as may be, strive to overcome them. Thou O great God, who in the Inventory of these smallest Creatures, makest the most excellent understandings to stand amazed and stupid; give me strength, that as by thy goodness I have mustered those Insects that fly, by the same I may be enabled to draw forth all those Foot-forces that want wings; so that in all my labour, I may seem to have no other end than to seek thy glory, to advance learning, and nothing that concerns my own particular, but that I may finde thee in these thy works. Go to therefore bold Atheist, who art ignorant of God and the Divine Perfection: endure, if thou canst, the biting of the Spider *Phalangium*, or of the Scorpion; abide the pain of the Worm *Scolopendra*; swallow down the Pine-tree Catterpillar, contend with Worms, despise with *Herod*, biting Lice, so much as thou art able, at last thou shalt finde that there is no foot Souldier so mean in this Army, that will not quickly overcome all the forces of thy body and minde, and will make thy foul mouth to confess, by their ministry, that there is a God. Thus then I draw forth my Regiments, so I muster the Souldiers.

CHAP. I.

Concerning Catterpillers and their several kindes, and namely of
Silk-spinners, and Silk-worms.

WEE thought fit to place in the Front, Catterpillers, the devourers of Egypt: because they are most different in their kindes, and also some of them are excellent for their use and worth. It is no fond conceit to maintain that Catterpillers had their name in Latine from devouring, for they eat up leaves, boughs, flowers, fruits; which also may be observed in the Peach. *Ovid* called these Field-worms:

*Field-worms that weave their hoary thred on boughs, we finde
That they with painted Butterflies do change their kinde.*

The Greeks call a Catterpillar *αἰμωίη*, from the waving and vaulting motion, when it creeps, whereby it lifts up and contracts it self. The Hebrews call it *Ghazam*, because it sheareth the fruits of the earth, as *Kimhi* saith on *Joel* the first. The Italians call it *Rugaverme*, and *Bruchos* for so saith *Marcellus Virgilius* upon *Dioscorides*. In our times, saith he, our whole Countrey calls all kindes of Catterpillers *Bruchi*. The Spaniards call them *Oruga*; the French, *Chenille*, *Chatterpillers* *Onbuts*; the Southern call them *Palmer-worms*; in the Poles language, a Catterpillar is called *Rup hausenka*; in the German Tongue *Ein Raupe*; in Low Dutch, *Ruype*; in Sclavonish, *Gafienica*; the Pelants call them *Certris*, and *Cedebroa*.

I should be endless if I should add all kindes of Catterpillers; for some feel rough, others soft, some have horns, (and that either in their head or in their tail); some are without horns; some have many feet, some fewer, but none have above sixteen feet. Most of them move swiftly in a waving posture; yet others there are that go even and slowly. Some do yearly change their old skin, and others do not. Some are changed into *Aurelia's* fixed above the earth, whence are bred your ordinary Butterflies, others are transformed under the earth, and become Glow-worms. Also some of their *Aurelia's* are smooth and equal; some again are hairy and wrinkled, pointed at the ends, sharp; some (namely of the harder kinde) naked, but others (namely of the tenderest) are covered with moss or filken down. The most of them are bred of the eggs of Butterflies, and are changed into *Aurelia's*: some are bred on the leaves of trees, of the proper seed left there in the web in Autumn; or of the dew or air shut up in it, and corrupting there, as Vine-fretters. Some again feed on leaves, some on flowers, and some on fruits. We, to expresse both kindes of Catterpillers, shall divide them into those that are bred from other things; and those that are bred from their own kinde alone. Such as are bred from other things, again, are either smooth or hairy; as also those are that proceed from their own kindes. Amongst the smooth Catterpillers, the Silkworm deservedly challengeth the first place.

Edward Mar-
tin Borellus,
lib. 5.

A worm that to a Fly transformed is, and then
Transformed back once more is made a worm agen;
Twice it both dies and lives anew, is wasted ore
By Charon twice unto the Elizian shore.
Its successor is left half living and half dead,
Which after spins silk robes for those are finely bred.
Fine thread this Silk-worm makes, why doth she labour thus?
It is not for her self she labours, but for us.
Her fleece was formerly an ornament for Kings,
But this prodigious age confusion brings:
So prodigal of silks, that the vile rabble, clowns,
Oyster-wives, herb-women, shine in silk suits and gowns:
Nothing more common now for all than silk attire,
Which wastes and burns mens hearts with continual fire.

In which words, though our divine Poet, who was more clear than the ancient Bards, doth something touch upon the Silk-worms, and paint them forth, yet he doth not describe them so fully, that it may suffice for the History of them. For Silk-worms are smooth Caterpillars almost of a milky colour, with small black eyes, and as you see, with a forked mouth. The snow white ones are bred of Butterflies eggs, which growing by degrees into little worms, produce Silk-worms of the same colour with Butterflies. And that I may not repeat this again, let it suffice that I have once said it; the Butterfly is almost alwaies of the same colour with its Caterpillar. That Butterfly forsaking its Aurelia, as many eggs as it leaves, or seeds (if you will) like to eggs, they become so many Silk-worms afterwards; which, if you cherish them, when they are fostered by the Suns heat, and full fed with Mulberry leaves, they will repay a reward worth your cost and care, namely a silken fleece. They breed first in May, in which moneth and the two following moneths, they devour a multitude of leaves, and in eating as it were by sucking they harden: when they are grown up with plenty of nourishment, being become able, they spin a most fine web out of themselves, like to a Spiders web. Then against cold weather, they grow rough with hair, and make themselves new thick coats for Winter, by the sharpness of their claws, pulling the down of their skins into fleeces: then they thicken and close it, carding it with their feet; then they draw it out amongst the boughs, and make it small as with a comb: lastly they take hold of this web, and wrap their body in it, making a round nest. Then men take them, and put them in earthen vessels, and feed them with bran, and so there spring up feathers of their kinde; which, so soon as they are prepared with, they are set to perform other tasks. But the spinning work they began, growes pliable by moisture, and is spun into threads on a small spindle. Some women do use to draw it forth into yarn, and then they weave it. *Pamphila* the daughter of *Larous* was the first that was reported to have woven in the Island of *Co*. Also *Pliny* reports that Silk-worms are bred in that Island, *Plin. lib. 11. cap. 23.* the flowers of the Cypress, Turpentine, Ash, Oake-trees, being beaten down to the ground by showres, whence they receive life. Though women were the first inventers of this Art, yet men are not ashamed to wear these garments for lightness in Summer. The customes of men are so far degenerate from Arms, that their very cloathes are grown burthensome. The thinner and softer the leaves are they feed upon, the finer Silk these Silk-worms make: wherefore amongst the people of *Seres* in *Scythia*, the most soft garments are made; which we call silken, as *Marcellinus* witnesseth, *lib. Hist. 23.* In *India* also and in *Egypt* there is great plenty and use of them, and are brought from thence to the *Spaniards* and *Italians*, being the greatest cause of wantonness amongst mortals. So often as I consider, that some ten thousands of Silk-worms labouring continually night and day, can hardly make three ounces of Silk, so often do I condemn the excessive profusion and luxuriousness of men in such costly things who defile with dirt, Silks and Velvets, that were formerly the ornaments of Kings, and make no more reckoning of them now, than of an old tattered cloak, as if they were ashamed to esteem better of an honourable thing than of a base, and were wholly bent upon waste. The Greeks call this Caterpillar *sis*, and *Bombyx*, which name is become Latine. The *Italians* call it *Bigatto*; the *Spaniards*, *Gusano della seda*; the French, *Ver à Soye*; the Germans, *Ein Seyde worme*; the English, *Silk-worm*. Amongst whom a Silken habit is so much loved and valued, that they despise their own Wool, (which compared with Silk, is not contemptible, and is the most profitable and the greatest merchandise of the Kingdome.) But time will make them forgoe this wantonness, when they shall observe that their moneys are treasured up in *Italy* at that time, when they stand in need of it for their private or publick affairs. This is a pleasant thing and worthy to be noted, that the head of the Silk-worm, makes the tail of the Butterfly in that golden coloured Metamorphosis, and the tail the head; which also happeneth in all other Caterpillars that are changed into an Aurelia.

The Name.

CHAP. II.

Of the rest of the smooth Caterpillars.

Green 5. **A**LL the other smooth Caterpillars, are either green or yellow, or reddish, or dark, or various colours. The chief Caterpillar of the green, is that which hangs upon the Privet; a circle surrounds the face of it, and all its feet; and it hath a horn turned backwards in the tail. They are black and red, spots are made athwart their sides, they are half purple, half white; the small spots are red, but their whole body appears green. That upon the Elder-tree differs not much from it, but that it is altogether green, except those overthwart spots very white, and some little points like milk. It chiefly feeds on the reddish coloured Elder.

The third, that is all green, when Autumn comes is transformed into a blackish case: it feeds on the softer Pot-herbs, especially on Lettice, whence we call it the Lettice Caterpillar.

The fourth upon the Medlar-tree is less, all over green, drawing it self into an ash-coloured case, all besprinkled with most black spots.

The fifth is least of all, spins its threds on trees, (especially upon the Oake, and descends by them upon the heads of those that pass along, and intangles their hats and cloathes: a very little creature, most noted in Summer, and obvious every where, when the fall of the leaf is at hand; he wraps himself in a coarse web, and being shut up in a red and green cover, he dieth in Winter. He hath but ten feet, as all the rest that went before had.

*Yellowish
are 3.*

We call them yellowish, that are most part yellow: such these figures present you with, which is kept, wheresoever they are void of black, overcast that with a paler yellow, and you have their figures painted. They live on softer leaves, especially on the Tiel-tree.

Vinula is next in order ; which is a most delicate Catterpillar, and beautiful beyond belief, we have found it on the Willow feeding greedily, the lips and mouth of it are a pale yellow, the eyes are fiery, the forehead is purple, the feet and the lower body green, the tail is forked, blacker than grapes, the whole body is spotted as with thick and dark red wine, which passing from the neck crossway to the very tail, a most white line doth wonderfully adorn it.

The Catterpillar called *Porcellus*, Dark 2. is black, brown, especially the greater, but the lesser hath the circles white. Frequently they are found on the leaves of meadow Trifolie, and they devour them with wonderful swiftness.

Three various colours are chiefly observed ; the first hath a blewish face, and very black eyes, the outward skin of the back is grayish, much besprinkled with black and yellow spots ; it is changed into an Aurelia of a bright bay garnished with a white small membrane ; it loveth Cabbage and all kinde of Turneps.

The second hath the head and feet and tail very black, being chequered with yellow ; the chequering that are painted on them inwardly, are distinguished by channels black and gray, drawn longwaies by turns. It loveth Fennel, and Anniseed, and Cummin.

The third is green from white, bunched as it goeth along, for it hath only six feet on both sides, as those before. It is changed into an Aurelia set with prickles, of a dark colour. It consumes Olives.

The fourth feeds on Dragon-wort, and resembles a spotted Viper ; it goes alwaies with the head upright, and leans chiefly on its breast. It loves Bulrushes, and plants that bear down, and are bred in rivers.

If you paint the ribs descending of the fifth kinde with old Minium, there will be few things in the picture that shall not agree with the truth.

In the sixth what you see white, paint with Ocre. Both of them delight in the black Poplar-tree, and feed greedily on it.

Tree

The

The chamferings bred in the seventh, must be white from yellow; all the rest of the body is of a dark colour, and changeth it self into an Aurelia, of a light red colour.

The eighth seems of the colour of ashes, waving out of black: it makes a case between black and a bright red, whence growes a dusky coloured Glow-worm.

The ninth is various, and deservedly thought so: the roundles of the incisions are green; the horn of the tail is bent backwards, and is of a bright blew; under which a red coloured spot serves to make it beautiful: the middle part of the incisions is ashes colour. Lastly, an Aurelia is included of a murrey colour. We found this in the high way; it delights in the field Crow-foot.

The tenth is gray and black; for what is here white, lay gray upon it, and it will represent the creature. It is changed into a spiral case, of a weak blew colour; the roundles being somewhat red; and it comes next to the form of a horn fashion periwinkle.

The smooth Catterpillar comes from the wilde night-shade (which the Italians call *Belladonna*) of a green and yellow colour, it hath a horn in the forehead as long as ones finger, which *Cardanus* relates that he saw often.

CHAP. III.

Of Catterpillers rough and hairy.

Those with hairs are the most mischievous of all: some are very thick of hair, others thinner; whereof I here afford you the kinds. Amongst those of the thicker hair, are walkers up and down, such as are upon Nut-tree leaves, Pine-trees; such as have sayl-yards, such as are called *Neustria*, Pear-eaters; such as are upon Nettles, Cabbage, Hedges, feeders on Poplar, such as lose their skins, such as are amongst Marigolds, black and green, &c. Those that have thinner hairs are *Echini*, dwellers amongst Fennel, eaters of bushes, half white: of which we shall speak in order.

Pityocampes, that is, Catterpillers on the Pitch and Pine trees, are as thick as a mans little finger, and as long as the breadth of three fingers. They have eleven incisions between their heads and tails, and they have sixteen feet like the rest, namely about the head on both sides three, on the middle of their bodies on both sides four, and at the ends of their tails on both sides one: but the first are crooked and small, wherewith they try their way, the rest are broader and jagged like sawes, that they may stick the faster to the boughs. The head is like an Ant, the rest like common Catterpillers; they are rough with hair and encompassed on all sides with straight bristles: the hairs bred on the ir sides are white, they shine on their backs; the middle part whereof is adorned with spots like to eyes; the bristles being shaved off, there is a black skin underneath, their hairs very slender, yet they prick more sharply than a nettle, and cause very great pain, heat, a Feaver, pricking, unquietness. For the poyson enters suddenly without any sense of the wound, and is carryed to the parts next the bowels. They spin fine webs like to Spiders, drawing and disposing their threds with their fore-feet. Towards night they go under these, as they were

rents,

tents, that they may escape the inconveniencies of cold and storms. The matter of this tent is so fast and fine, that it is not in danger by the greatest winds, nor is it sob'd with rain: and it is so spacious, that a thousand Caterpillars may be under it. They make their nests in the small boughs of the Pine and Pitch trees, where they live not solitary as others do, but by flocks: which way so ever they bend their course, they spin and carry their thred for the web along with them; and at break of day, if it be but fair weather, the great ones accompany the lesser by troops, and having made the trees void of leaves, for they consume them all, they labour hard in weaving. Only these plagues of the Pine and Pitch trees do not meddle with other Cone Apple trees. In Mount *Athos*, the woods of *Trent*, and in the vallies beyond the *Alps* they abound very much, by reason of plenty of leaves for their nourishment, as *Matthiolus* witnesseth. They are truly most venomous creatures, whether you touch them outwardly with your hands, or they be given inwardly. They were of old esteemed so certainly to be poyson, that *Ulpian* interpreting the *Cornelian* Law concerning private murderers, set down amongst them to be punished those that give a Pine Caterpillar to drink. *Seet. Alium. ff. ad leg. Corn. de sic.* When one hath swallowed a Pine Caterpillar, the pain grievously afflicts both the mouth and palat; the tongue, belly and stomach are greatly inflamed by the corroding poyson: also a wonderful pain vexeth them, though at first they seemed only to feel a pleasant kinde of tickling: great heat followeth, loathing of meat, and a perpetual desire to vomit, but ineffectual. At length if it be not helped, they burn the body, and make the stomach crusty almost like to *Arsenick*. *Diosc. Aetius, Plin. Cels. Gal.* also 11. *simpl. c. 5.* and *Avic. sof. cap. 25.* Hence it is that *Aetius* and *Aegineta* held it dangerous to set the table for meat under the Pine-tree, or for to stay there, lest perhaps by the reak of the meat or vapour of the broth, or by noise of men, these Pine Caterpillars should be moved and fall down upon the meat, or should let fall their seeds, that are as deadly as themselves. They that are hurt by these must use the remedies against *Cantharides*, for the same means will cure them: but properly oyl made of *Quinces*, called *melinum*, and oyl Olive, is to be drank twice or thrice to cause vomit, as *Dioscorides* from *Aetius* hath prescribed. They are bred, or rather regenerated, as Vine-fretters are, from Autumnal seed left in the web in certain bladders, or from the Vine-fretters themselves corrupted, as *Scaliger* thought.

Now we proceed to walkers about. We call those walkers, who have no certain houses or food: wherefore they do something superstitiously wander like pilgrims, and like to Mice, they alwaies feed on others meat, wherefore the English call them *Palmer-worms*, namely for their wandring life, for they dwell no where, though by reason of their hair they are called *Bear-worms*. They will not be tied to any kinde of flowers or leaves, but they pass on boldly, and taste of all plants and trees, and feed where they please.

First those white spots which we see in their sides, must be such really; the whole body is black, all the inward hairs must be somewhat yellow, but all the uppermost on the back must be hoary, except those three ranks that are bred in the neck near the head, for they have the same colour with the hairs of the belly. Out of the *Aurelia* of this comes forth the Butterfly which you see here: whose colour, figure, and nature, we described in the Book before.

The second, if you make the neck and belly, and the hair there growing, yellow, you need do no more. The cover of it seems dusky, the eggs are pale. We explained the Butterfly that growes from thence in the former Book.

The third is, the whole body and hair, dusky yellow, but that the spots on each side being obliquely made in each incision lie hid, and the head being of a light red, is adorned with a certain white fork.

Signs of a
Pine Caterpillar
drank
and the cure.

The fourth hath his belly and lower hairs dusky, the back and upper hairs are yellow from dusky, a double forked line in the face resembles the colour of whey, or milk mingled with water.

The fifth hath a bright bay colour in the face, the sides of the belly hoary, a body various with small yellowish spots, and above these with black; yellow hairs come forth like small rags; they are sharp, and growing more sharp pointed from the middle: it hurts much the neighbouring herbs and the corn.

The sixth is a brown colour'd, if the incisions were not died with black and white spots here and there; the hairs are bred above and beneath, and set after a saw fashion; they are very rough and hard, but they are of the colour of the body.

The seventh hath a black skin, yet it hath hairs something of a dirty colour, I use to call it the *Pensill*, because on both sides of the forehead, and also in the rump a soft pensil breaks forth of a crow-black colour: but those wedge fashioned eminences that you see in the back, are white as milk at the root, otherwise somewhat black.

The eighth holds forth a Mouse colour, on whose back thote seven joynts resemble it.

The ninth is a strange and rare colour: for all the incisions are painted with various colours one from another, yet mingled one with another, which a silver stud doth adorn severally one by one.

The tenth is amongst the sports of wanton nature, not less elegant than it is rare, being streaked with black, green, blew, yellow ridges, and smooth strings; which some golden spots do wonderfully illustrate: it hath very soft hair, of an admirable and most pleasing freshness; it hath a purple cover fortified with a small membrane.

Suppose the white incisions of the eleventh to be green as Leeks, and paint the skin and hairs half green.

The Nut-tree Caterpillar is of a pale green, except three black spots between the joints, and that horn at the end of the back, and growing as it were on the rump, which receives a fresh rose colour. It especially sits on the leaves of the Hazel-nut, whence we call it *Corylaria*. I saw two kinds of them, one was a full, the other a paler green.

The manifold delicacy of Nature shines forth in these, to which though it giveth them the face of a *Moor* or *Egyptian*, yet it affords them a garment that is of changeable colours, shining in divers works and real art; in the forehead, the hairs are knit as into knotty locks, and resemble the sail-yard: the like are found in the extremity of their backs. The skin is like the rain-bow, and shines in circles deeply dyed with purple, which nature hath fastned to the sides like broad studs; the hairs bred in the skin, shine like the Sun, and dazle our eyes in a clear day.

We received two *Neustria* out of Normandy, the first had a face of a blew colour, and the body ridged with white red and gray streaks; the hairs are comely with a golden shining colour. The lesser rolled together, is like an Urchin; the head is cole-black, the body is variously spotted with little blew spots; the hairs resemble a Saffron lustre.

This corrupts the buds of the pear tree, having a black smudged face; the body is adorned with some black red white ridges; in the middle as it were of the shoulders, and to the end almost of the back, little swellings or bunches arise of black and blew colour, sprinkled with white spots. The Eggs from whence they breed are a bright bay colour, which is also the colour of the *Aurelia*, and of the hair. We saw another of the same kinde, but only it had a bunch on the back.

We call that half white, which is by nature yellow from the head to half the back, and the rest white as a Lilly. The belly is yellow and ash-coloured, adorned with studs, and chequered in the middle.

If you touch the feet of the Nettle Caterpillar lightly with a fading yellow, the figure will differ little from the natural: it hath hard upright hairs growing like thorns, they wound with a small touch, and at first they cause a pleasant itching, but venomous; but after that a pain hard to be endured. Some maintain that it is more venomous than the Pine-tree Caterpillar.

On a Cabbage a Caterpillar breeds with a bright blew head, his body is marked with two yellow branches on both sides; between which a grayish plat as it were, seems to be spotted with some black seeds: the hairs obtain the colour of the Aurelia, which is ashes colour.

Here we shew you two hedge Caterpillers, the greater hath a face Saffron coloured, but that triangle you see in place of its nose, was Lilly coloured: the body is varied with spots, white, yellow, red and black, (which we have expressed) placed in no order; it is rough with yellowish hairs: it devours the leaves of hedges and makes them naked: where at length, leaving a bottom of yarn of courser silk, she drawes her self into a case of a bay colour, as into a sepulchre. The lesser hath a countenance blewish, as also the whole body, except that it hath spots black and white; it hath hairs of the same colour with the former.

These have fewer hairs: namely, Cranesbill-eater Caterpillers, St. James wort Caterpillers, Sayl-yard, Urchin, Bramble Caterpillers, and that little horn beast, which the Germans call Horn-worm.

We have here set down exactly the form and magnitude of the Cranesbill-eater, you must make the white spots that adorn its black girdles of an iron colour; and paint the belly and feet, and the white space between the girdles, with a Leek-green colour. *Camerarius* sent this to *Pennins*, with this subscription: A great Caterpillar, feeding only on wilde herbs, and is especially an enemy to Crowfoot Cranesbill in the Marishes.

The body of the Sayl-yard is various; from the head to the third incision, you would say he were smeared with chalk, in the five following with ashy dark colour, and on the three last with white lead; the sayls are made of hairs as it were platted together, the like stand up at the end of his back like a crest: Those four tufts on the back are made of hairs also growing in order like to teeth.

St. James wort Caterpillar, or that which eats the greater Groundsel; with the head and feet of a decayed purple colour, the belly of a pale green, hath the body of an unpleasant fading green, and adorned with black yellow and fiery coloured spots; the colour of the hair agree with the belly.

I have observed two kindes of Urchins, one of a blewish green, the other a mingled white.

The first of the Urchin Caterpillers hath a chequered body, varied with black and yellow; the thorny bristles seem yellow, when Autumn comes it is transformed into an ashy coloured Aurelia.

The second is perfectly like an Urchin, half the back, namely the first half, is black from yellow, the latter is white from yellow, it hath pricks very sharp and thick, of a grayish colour.

Nature hath painted the bramble Caterpillar ashy black, on both sides with three ridges of a pale yellow colour: the hairs are very thin, and altogether black.

There

There is also the horn Catterpillar, who hath many green spots from yellow, the hairs bred on the middle of the back are hoary, but the horn is notched and red.

Many diversities there are of these Catterpillers upon the Mullen, Hop, Pile-wort, Bitter-sweet, Nightshade, Elder, Elm, Bassil, Tythimals, and almost every herb hath its particular devouring Catterpillar: which, that I may not prove tedious, I overpass, as well enough known. I never had the hap to see the stinking Catterpillar of *Gesner*, described by him in these words, as I have it in writing: It is, saith he, most like the horned Catterpillar, but it differs something in the horns and colour. I took one creeping on a wall at the end of *August* in 1550. It sends forth a filthy smell, that you would verily believe it were venomous: it was angry, and with its two forefeet it held the head alwaies upright: I think it is blinde, it was a finger long, and thick, it was rough on the back and sides, with a few hairs scattering on them; the back was black; the colour of the belly and sides was reddish from yellow: the whole body is distinguished by fourteen distinct knots: all these joynts again have a prop or wrinkle over the back; it hath a black somewhat hard head, the mouth is forked and dented, or saw-fashioned; whatsoever it catcheth with these nippers, it bites it: it goes on sixteen feet, as most of the Catterpillers do, without doubt it is venomous. *Vergerus* thought it to be the Pine-Catterpillar; others thought it was Scolopendra. But its number of feet will not let it be Scolopendra. I could scarce endure the smell while I took the description alive: it did so infect two stoves with an extreme and intolerable stink, that I could not stay to endure it: so sayeth *Gesner*.

CHAP. IV.

Of the original, breeding, nourishment, and change of Catterpillars.

Dear book, the faithfull witnesse of my pain,
Let not the purple red thy fair cheeks stain,
Whilest I in tables paint the rude worms races,
And such as change their skins into a case.
For these by Gods wise hand created are;
Which in small things is wonderful and rare,
And more to be admired in Worms, than Whales;
Or Elephants, Leviathan with scales,
Arm'd as with harnesses, strong as iron bars,
And roars like thunder terrible in wars;
Who drinks the sea, and spews it up again,
Compar'd with worms, will be admir'd in vain.

So I shall begin with our Poet, who observed a divine power in Catterpillers from their Original; which whilet divers Authors have diversly expressed, I know not into how great dark-

darkness they have cast us. *Aristot.* 5. *Hist.* 19. writes, that they begin from green leaves of herbs, as from Cabbage, or Radish: namely by a seed like Millet left there in Autumn, whence little Worms proceed. From these Worms in three daies space Caterpillers breed at the end of the Spring; which being augmented and nourished sufficiently, they leave off moving, and at the beginning of Autumn they change their form and life for an Aurelia. *Pliny* saith that dew thickned by heat of the Sun, is left upon the leaves, whence he derives all kindes of Caterpillers, to whom *Arnoldus* agrees: others say they all come from Butterflies; which so soon as they come forth of their Aureliae, they thrust forth (above or beneath the leaves hard by) some eggs (the barbarous call them *Turds*) and these are greater or less, according to their bodies (some of these have blew shells, some yellow, some white or black, green or red) in fourteen daies they are hatched by heat of the Sun, and the shell breaking, they thrust forth small Caterpillers like very small Worms, but coloured: at first beginning they are very hungry, and do nothing but devour leaves and flowers, especially of those herbs and plants where they were left in eggs. But I should maintain that they are not bred only one way, but all these waies: for though *Aristotles* doctrine seems to some not acute enough, that the Cabbage little Worm grows to be a Caterpillar; yet it is not against reason; for as nature from an egg, so from a worm she produceth a more perfect living creature, as perfecting, not as corrupting. For though the worm be not that it was before, (as is clear to sense) yet as much as can be perceived, it is both what it was, and is now somewhat more, for a Worm doth not dye that a Caterpillar may be bred: but adds a greater magnitude to its former body and feet, colour, wings; to life remaining, it gets other parts, and other offices: so the off-spring of man (I use *Scaligers* words) after some daies at first of a man in posse, is made a man actually; you must understand its generation, in which time the intellectual soul doth not yet act, but it bears the same proportion to a man that shall be, as a Worm doth to a Caterpillar or Bee. So also *Pennius* derided the opinion of *Pliny*, when he writ that Caterpillers were bred of dew, yet all Philosophers with one consent agree, that the more imperfect small creatures are bred of dew. And not without cause. For the Sun by heating acts, being like the form, and the humour is like the matter. The Suns heat is different from the fire, for it gives life, or it preserves the souls in their likeness. For the dew hath the proportion and softness of the air, where *Theophrastus* alledgeth the affect of softness (in his Book of Plants) as proper for generating air. Also nothing is more nourishing than dew, by which alone some little creatures live: which also the divine Poet said; *How much doth dew lay up in the night!* Therefore as it is humour, it is the matter, as it is thin, it enters, as it is drawn by the Sun, and concocted, it is the fitter for generation; for the preparation of the form carries the matter along with it, and these going together it falls out that a living creature is generated. And it is not only an off-spring of dew, but the daughter of Butterflies, as we said, and as experience testifieth: and the greatest part of Caterpillers come from them, besides the Cabbage and Vine-fretters, few are bred otherwise. For these that the Greeks call *ims*, are made of dew, or a humour shut up in webs and putrefying, especially when the wind is East, and the air warm, that hastneth corruption. For then such a mighty army of them breaks forth in our Countrey, that we cannot truly say or think so many could be bred any way but from corruption. They are all gluttonous devourers of herbs and trees: whence *Philip* the Parasite boasts of himself in *Athenens* in his Pythagorist, for feeding on Thyme and Pot-herbs, *I am a Caterpillar.* *Martial* speaks to the same purpose, *One garden will hardly feed a Caterpillar.* When their time of eating is over, they wander up and down here and there hungry, and by degrees growing lean with hunger, some within, some above the earth, seek for a fit place, where they are transformed into an Aurelia covered with a Membrane, and hanging by a thred, or into a bare case; if this happen in the midst of Summer, after 24 daies the shell breaking, a Butte fly presently flies out: but if Autumn be well spent, the Aurelia lasts all the Winter, and shuts out nothing till the heat of the Spring. Yet all Caterpillers are not changed into Aurelia's, but some are contracted (as Vine-fretters) and corrupt, from whom oft-times three blackish eggs fall, that are the mothers of Flies or Cantharides: when your Butter-flies copulate very late, they bring forth eggs (even untill the next Spring) that have life, (if you take diligent care of them) as it is usual in Silk-worms, whose eggs are sold commonly amongst the *Spaniards* by ounces, and pounds. *Theophrastus* distinguisheth the transformation of these Caterpillers rightly in these words, in his second of Plants: First, of a Caterpillar is made an Aurelia, and of this a Butterfly, then of that a Caterpillar again. But whether this Aurelian Chrysalis be a living creature or not, we shall dispute when we come to speak of Insects without feet.

CHAP. V.

Of the quality and use of Caterpillers, and of their Antidotes.

ALL Caterpillers have a burning quality and pilling of the skin, and raising of blisters. The most deadly is the Pine Caterpillar, yet they are all venomous, but least of all those that are smooth and without hair. The daughter of *Calius secundus*, being at *Basil* (saith *Gesner*) when

when she had devoured some Cabbage Catterpillers in the garden, after much vomiting, her belly swelled, the swelling troubled her many years, and no cure would be found for it. *William Turner* a Divine and a learned Physician, the happy father of one *Peter* who was born to give physick to Physick it self, prescribed a purging potion for a noble Woman of *England*, by the help whereof she vomited up a hairy Catterpillar, which being swallowed by negligence, had long afflicted her with cruel torments: yet we may remember (saith *Marcellus Virgilinus*) that there are beasts in the sea of the same names, and called Catterpillers, and are far from being poyson; and amongst those men that live by the sea side, are the last dish at their tables. We have shewed remedies against the mischievous and venomous ones before, in the Histories of *Cantharides*, *Buprestis*, and *Piryocampes*, for they admit of, and require the same cure. If you would have your garden or trees free from them, what webs you see hang on the naked boughs you must sweep off in Winter; for if you let them remain till the Spring, they will breed before you can remove them. In a short space they devour all green things, and consume the flowers: some anoint their trees with the gall of a green Lizard, or of a Bull, which as it is commonly reported, they cannot endure. The Countreymen use to stifle them with some brimstone and straw set a fire under the trees. The earth dug up under the root of the great bearing mast tree, if it be strewed in a garden, drives away Catterpillers, saith *Hildegard*. I should pass over the Remedy *Columella* hath prescribed, as a shameless delusion of *Democritus*, did not *Pliny* and almost all the rest approve of it, who meddle with husbandry: the words are these:

*But if against this plague no Art prevail,
The Trojan Arts will do't, when others fail.
A woman barefoot with her hair untied,
And naked breasts must walk as if she cried,
And after Venus sports she must surround*

*Ten times, the garden beds and orchard ground.
When she hath done, 'tis wonderful to see,
The Catterpillers fall off from the tree,
As fast as drops of rain, when with a crook,
For Acorns or Apples the tree is shook.*

They touch not Plants that are besprinkled with Wine. *Theophrast*. They presently dye with the smoke of the herb *Pfora*. *Aetius*. Hence it appears (saith *Silvius*) that the vulgarly called Scabious, is not *Pfora*. The Cabbage is free from Catterpillers, if it be fenced with Vetches. The Worms found in Fullers Teasels, make them fall if they but touch the Cabbage Catterpillers. *Pliny*. Strew your Cabbage with Nitre, or salt earth, whilst it hath lost but three leaves, or strew it with ashes, and by the saltness of it, it will drive away Catterpillers. *Geopon*. *Palladius* in this matter prefers the Fig-tree ashes. If Crabs or river Crevish, were hanged up and exposed to the Sun for ten daies, they will drive Catterpillers from Pot herbs. *Cardan* out of *Palladius*. Others wet the seeds just before they set them, in the bloud of a Catterpillar, or the juice of Marjoram, to free them from Catterpillers. A sea Onion set or hung in a garden, hinders the Catterpillers from breeding. Some sow Mints, others Vetches, others Wormwood about their gardens to drive away Catterpillers. Some not without cause, have Coleworts and Garlick leaves in their gardens, by the fume whereof spread every way the Catterpillers fall down. *Palladius*, where any man may easily read of many remedies against them. If a Horse devour them, swellings arise, the skin of him grows dry and hard, his eyes hollow, saith *Heracles*, and he prescribes this remedy: *You must take the sharpest Vinegar and Nitre three quarters of a pint, Vitriol a fourth part; mingle them and anoint the Horses body, be careful that it enter not into his eyes.* Now we shall speak of the use of them in Physick, and in the Common-wealth. The Catterpillers web and covering (like to silk) being drank stops a womans courses. *Math*. If it be burnt and put into the nostrils, it stops bleeding at the nose. The Catterpillar feeding on Privet, doth not only in a strange manner allure the Carp, if it be put on the hook for a bait, but also the dung of it put into the nostrils, presently helps the falling sickness in women, that proceeds from the Matrix, as I was told by a Midwife that was very experienced, and worthy to be believed. The Catterpillers that are upon Spurges (in the opinion of *Hippocrates*) are very good for purulent wombs, especially if they be dried in the Sun, with the double weight of dunghil Worms, and adding a little Anniseed, bringing them into powder, and infusing them in the best white Wine, and so giving them to drink. But heaviness following in the belly with numbness, let the Patient drink a little water and honey after it. *Hippocrat. lib. de supersæt.* prescribes those ordinary Catterpillers that are in troopsto be given in drink against the Quinsy. *Dioscor. lib. i. cap. 90.* But unless they do profit by their secret quality, I think they are to be rejected for their open quality, especially in that disease. The Germans know that the hairy Catterpillar dried and powdered, stops the flux of the belly. *Nicander* also useth them to procure sleep: for so he writes, And *Jeremy Martius* thus translates him:

*Stamp but with oyl those Worms that eat the leaves,
Whose backs are painted with a greenish hue,
Anoint your body with't, and whilst that cleaves,
You shall with gentle sleep bid cares adieu.*

There are in prickly and hairy plants, such as the Nettle is, some downy and hairy Catterpillers, by tradition are held to cure children, when they cannot swallow their meat for straightness

ness of their jaws. A Caterpillar that lives on Pot-herbs being bruised and anointed where a Serpent hath stung, is very good. *Avicen.* If you rub a rotten tooth often with a Cabbage Caterpillar, it will soon fall out of it self, saith the same Author. Caterpillars mingled with Oyl, drive away Serpents. *Dioscor.* If you anoint your hands or other parts with the same Oyl, it will keep them from being hurt by Wasps or Hornets. *Actius.* *Pliny* citeth many superstitious things from the opinion of Magicians concerning the vertue of Caterpillars; which because I see they are cast forth of the Schools of Divines, and I in my judgement do secretly disavow them, I will not repeat them here. They are meat also for divers Birds that we eat, and are useful for us, as namely Choughs, Starlings, Peacocks, Hens, Thrushes, to say nothing of Trouts, Robbin-red-breasts, Tenches, Carps, Pikes, which are easily deceived by a Caterpillar bait. And if you desire to know the waies of deceiving them; see *Terentius* in *Geopon.* who is there (that I may not overpass the Physick of the soul given by Caterpillars) that hath not sung of Gods mercies shewed to the wandring *Israelites*, when all *Egypt* swarm'd and was even drowned with the deluge of them? Also amongst the *Romans* there was twice in one Summer such a cloud of Caterpillars, *Anno 1570.* that put them in great fear, for they left no green thing in their fields, but devoured all. Though the fruitfulness of the next year did blot out the memory of this grievous punishment, yet we may not doubt but it put many of them in minde to lead better lives. God grant that we may escape by being corrected in the punishment of other men. Let us think no creature of God to be contemptible, for God can, if he please, make the smallest the greatest judgement.

CHAP. VI.

Of the Whirlworm.

THE Greeks call it *Σπονδυλάν*; which *Gaza* interprets by *Verticillus*: *Pliny* changeth not the Greek word, but calls it *Sphondylam*; the Germans *Eugerle*, as *George Agricola* teacheth. *Gesner* writes it was called *Twaer*, because it goeth diversly with sawed feet. The Northern English call it *Andever*; the Southern, *Whirlworm*, that is, a Whirl or little hairy Worm with many feet: *Vincentius* calls it *Zuvarola*, because it hurts gourds: *Pliny* was in an error, that makes this a Serpent, since the kinde of life and reason it self numbers it amongst Insects. Should I here add the differences between *Gaza*, *Pliny*, *Theophrastus*, *Absyrtnus*, *Phavorinus*, and the Scholiast on *Aristophanes*, and *Erasmus*, concerning the nature and form of this Whirlworm, I should indeed trifle, and rather bring fire to quench this fire amongst wits, than water. But I rather collect out of their dissensions, that there are two kindes of Whirlworms; one about houses, another in the fields. For so *Aristotle* and *Absyrtnus* write. *Staphulinus* is like to the Whirlworms that are about houses. For saith he, your house Whirlworms copulate backward, and that in our sight, as Beetles do, the male coming upon the female, and they stick long in copulation. Away then with these triflings of *Pliny*, that would have these to be Serpents, which never copulate backwards. *Hesychius* and *Favorinus* that follows him describe them thus: *Men say that the Whirl is like to an Insect called Silphium, making a stinking smell, if any one touch it.* But *Aristophanes* and his Scholiast, paint it out thus: *A Whirl is an Insect like to a Blood-sucker.* *Camerfius* out of *Aristophanes* saith, *a Whirl is a worm like a Leech, smelling most stinkingly.* Whence I collect that there is a house Whirl like to *Silphius*, and smells so scurvily, which if you touch, runs away, and stinks for fear: for so *Aristophanes* hath it, *ἔν σπῆρμ.* As the Whirl flying from you breaks wind stinkingly. In which verse I cannot but wonder that *Erasmus* (I know not by what Atticism) calls the Whirl *Telem*, *Chil. Adag. 3. cent. 7.* *Pliny* saith it is a very small body, and blackish, which if it be touched whilest it lives, and after it is dead, sends forth a most terrible smell. I confess ingenuously, that I never yet saw it nor know whether it be so by a contrariety in our land or climate. Concerning the field Whirl, we read thus in *Theophrastus*, as *Gaza* hath interpreted, of small wilde creatures that are bred outwardly, that is not in the roots but without them, none of them will feed on roots except the Whirl, and that leaves none untouched, for it is the proper nature of this Insect. *George Agricola* a most learned Philosopher, writes thus of Whirls that feed on roots: The Whirlworm is found under the earth wrapt up near the roots, (which truly I could never observe) and hence it hath its name *Sphondyle* from a little wherve or whirl. It is so long and thick as ones little finger, a red head, the rest of the body white, but that it is black above, where it swells when it is full. This plague of Orchards, which wants not feet (for it hath six feet) and doth not creep, eats up the pills about the roots of young trees; nor doth it at all forbear the roots of wilde Cucumers, black Chameleon, Centaury, hogs Fennel, Birthwort, Briony, which no other Insect whatsoever will touch. This Whirl without all doubt is the Insect that *Malleolus* in his Book of his filthy Exorcisms brings in these words: There is, saith he, a certain worm which the Germans call *Engar* or *Ingar*, it liveth under the earth, is so long as ones middle finger, of a white colour, a black head, six feet, which by turning about, furrowing and turning up the earth, and eating the roots, maketh plants barren.

The third year after its generation, it breaks forth like flying Pismires, which like their predecessors stick about trees, and consume the fruit. Then they call it *Lanbkæfer*. In the Diocess of *Mentz* there were such multitudes of them, that all remedies were attempted in vain, only they were driven away by charms (for so *Malleolus* reports) *Cordus* also speaks of them. *Spondyles* are worms under ground, the Germans call them *Engar* or *Ingar*, called so from the Greek *ἐγγύριος*.

The next year after they are bred, they are alwaies transformed into *May* Beetles: they hurt roots much, and feed on all kinds, (be the bitter or venomous) of young sprouts, and trees roots, so that suddenly the whole plants, or at least the leaves shall fade. When the Gardners see this, they dig about the roots of trees, and fetch forth these Worms and kill them. They do us most hurt in the moneths of *April* and *May*; in *July* and *August* many are found with us in marshy grounds, but there are no *May* worms but in *Devonshire* and *Cornwall*, and in the west of *England*. This we must note diligently, that it falls out with Insects as with Plants, that they change their colour with the climate and the earth. I have seen and I have by me a Whirl like a Catterpillar, that is of colour white from Ash-colour, with a black head, if it be touched it collects it self into a ball, and it fitly resembles the Whirl in a womans spindle when they spin; whence it hath its name. It is benumbed out of the earth, and cannot endure the air; being wounded, a moisture comes forth of a pale black, wherewith one may write Letters as by enamelling.

I have also a reddish Whirl that lives in the earth two foot deep, whose head is exceeding black, his mouth forked, the neck is reddish from yellow, the back is scarlet dye, the six forefeet are red-lead colour, the belly and all the body are perfect yellow, but that on both sides near the belly there are eight red spots, for ornament. It is so long as ones middle finger, and Summer coming, it is transformed into a Fly. I have seen one also clear coloured, with a thicker body, blewish from the middle of the back to the tail. But from the neck it appeared more grayish, the head and feet were yellow, the mouth was forked and red: whilest it is young the whole body is white, in age it grows yellow and blew, and it begins from the tail. It is wonderful how it will carry its body long and broad waies by a waving motion, and yet never change the place, and in moving it often changes colours. For whilest it lies on the earth it is all white, but when it is forced to move, as if it were angry, it appears black and blew. It is altogether like to the great Worms in wood, as for the form of its body, but they cannot wreath and turn themselves round. I have seen a great Fly bred from this Worm that hath four wings. We have another that was found at the roots of Onions; and almost of the same magnitude with the black and blew one, with a green head, and fourteen feet; it hath horns, and a tail green from white: the whole body is green, white, bloud red, noted with mingled colours: we call it *Onion Catterpillar*, we here represent the figures of them all. Now we shall add the opinion of *Joach. Camerarius* concerning Whirls, whose judgement I alwaies commend. It may be, saith he, Whirls are

those Worms that are found in the earth at the beginning of the Spring, that are almost white, or rather somewhat black and blew; which in Autumn become dark green, and with a shining skin, are coloured with a dark dye: their head is a light bay enclining to black, and something hard, that it can easily gnaw roots. Catterpillers soon rowl themselves up and die, and take other forms of Flies or Catterpillers. They are a finger thick, and an inch and half long, they have eight feet in the middle of their body toward the head. Our Countrey call them *Eardworms*. *Guilandinus* saith that *Whirls* are Worms so called, that like a Whirl they are round about the roots of trees. Also other Worms that are black, somewhat reddish, and have shell covers, with many feet, like the *Scolopendra* (and they seem to be of kind unto it, but that they are rounder, and not so broad) are found in the earth, and are dug out at the beginning of Summer, and roll themselves up the same way, as I said, if any one touch them. They also call these *Engerlin*, in Germany, that are yellow Worms under the earth with a black head, and near to that small feet, but have none in the rest of their bodies. These when they are dug up turn themselves into a round form, and being laid in the Sun they presently consume; for they live only under ground and eat the roots of Plants. Who would not account all these Worms that turn themselves round, to be amongst Whirls? So far *Camerarius*. *Niphus* upon *Aristotle* saith that Whirls are a round

round kinde of Spider, in the middle of whose body a cavity is to be seen, that resembles a Whirl of a spindle. But this was his dream against the Philosophers minde, and he deceived us. What use there is of Whirls in Physick I never read, nor do I know. This is certain from the Prince of the Philosophers, that Owls and night Ravens hunt after them, as also Moles, as it is probable: *Cordus* holds them to be venomous. In *Egypt* the Scorpions that they call *Sibyle*, eat Whirlworms, as *Alian* testifieth: but we shall pass from these to those called *Staphylini*.

CHAP. VII.

Of a Catterpillar called *Staphylinus*.

Aza translates *Staphylinos*, a Parsnip, either by sleepy carelesness, or rather ignorance: but as it appears in the short expositions of *Nicander*, the ancient Physicians knew it not sufficiently. For the Scholiast writes that *Staphylinus* is a little creature like a Whirl: others say it is like the Spanish Fly. *Hippocrates* speaks once of it, but describes it not.

Aristotle treating of the diseases of Horses, calls it an incurable disease, if a horse swallow a *Staphylinus*, that is like to a Whirl. But *Absyrtus* writes thus: A *Staphylinus* is like to a Whirl that is about houses, but is greater; it is bred every where in the fields, and goes holding up the tail. Whence I perceive it were no hard matter to know a *Staphylinus*, if the home bred Whirls were not unknown to us. But that I may do my part and satisfie my Reader, I will produce two Insects with their figures, which I cannot tell whether they may be called *Staphylini* or not. But that they are not far different from them is more than a conjecture. The

first (as you see) is all shining black, not much unlike to Beetles, but the body is more slender and longer. The whole body is two fingers square or somewhat less in length, the tail is with two forks; which whilest it flies away (for it will fly away and run very swiftly) it lifts up, as it were in its own defence, and thrusts out like two short stings very white: but we never saw it sting or strike with them; and the stings are too small and soft to enter: when he puts out these stings in anger, it pours forth with them a white and thick substance, but softer than a moist ointment. It lives most under ground, yet it is often seen amongst corn above the earth. But I cannot say that it is like to the Whirl that *Aristotle* or *Absyrtus* speaks of. The countrey people in *Kent* hold this to be a venomous creature, and that Oxen are swollen by this poyson as they are with eating *Long-legs*. It appears indeed that this *Staphylinus* is a venomous creature, not only from their report, but by the authority of *Aristotle* and *Nicander*. I received the second kinde of *Staphylinus*, a Worm of a wonderful form, from a Nobleman *Edmund Knivet*, exactly deciphered with his own hand, and they are very common in *Norfolk* in

England. He hath a small head, of a dark colour from red, almost round; the mouth is small and forked. Next the head it hath three feet on each side; the two former of them are short (like to Catterpillers) the other four are almost of a bloody colour, four times as long. In the middle of the body under the belly it hath eight feet that are blunt, as also a Catter-

pillar hath. The tail is bunchy and forked with two hairs. We learn hence that both these kindes are naturally venomous, because two horses eating hay and swallowing them down, were swoln all their bodies over, and died by them. In which disease it will not be useless to know *Absyrtus* his remedy, that in the like case we may have it ready, and cure our horses. For if a Horse eat a *Staphylinus*, whilest he feeds on hay or eats, he presently casts him out again, by reason of the sharpness of the spirits of it, and as it were Vipers blood. But presently he swells exceedingly. first therefore foment the swellings, largely washing and rubbing them with salt water very hot: then take vinegar Lees, and put into them fine linnen cut, and boyl this with water, and anoint him all over: but when he takes his physick, let him remain in a hot house, and a soft stall, covered

red well with cloathes, and let a good fire be kept continually by him. Anoint him abundantly in the morning, then the third day wash him well with hot water, and dry up his sweat, then rub him in a close place, and having rubbed him, anoint him with Nitre. And fear not though his lips and eyes swell, (for it useth so to fall out) for the Horse will certainly recover suddenly by this means, and be as well as he was before. But whether these be the same with *Staphylinus* of *Cordus*, or the *Courfilles* in *France*, let indifferent men judge. They are found in Orchards sometimes so long as ones little finger, and they make hillocks like to Moles, and there they sleep. They chiefly do mischief to Thyme and Elder, yet not so, but they hurt other plants and herbs also. If there be any that know any thing more certainly concerning *Staphylinus*, they are to be desired, for Physick and Philosophy sake, that they will not refuse to add their talent. So at last the natural History of Insects shall be enriched by their labour, and shall repay them not only great thanks, but also their part in a large increase.

CHAP. VIII.

Concerning the *Scolopendra* and *Juli*.

THE *Scolopendra*, and *Juli*, and *Cheesclips* march in the last rank. They far surpass in the number of their feet, Caterpillars, Staphylini, and Whirlworms, and all kindes of Insects, whence they are called Many-feet by a peculiar name belonging to them. *Aristotle* calls this *Scolopendra*; *Theophrastus*, *Scolopia*; *Dioscorides* (from the destruction of Serpents) calls it *Ophiotone*; *Varinus* and *Hesychius* call it *Amphydes phaganon*; others, *En-l*, and some call it *Thousand-feet*, and *Many-feet*; the vulgar Greeks call it *Scolopetra*; the Latines also call this *Scolopendra* and *Sepa*, and *dirty-hog*, and *hundred-feet*, *thousand-feet*, *many-feet*; which three last names also they give to *Juli*. In Hebrew they call it *Ghazam*; in Arabick, *Alcamptia*, and *Alamula*, as *Silvaticus* testifies; *Albertus* calls it *Almuga*, *Altapua*; in the Polish Tongue, *Stonogrobak*, *Gaflauka*; in the Hungarian Tongue, *Zones*, *Hiragopap*, *Matzkaia*; in High Dutch, *Ein nassel*; in Italian, *Centopede Vermi*; in French, *Chenille*, *Millepied*; in English, *Scolopender* and *Manyfoot*. In my judgement it differs as far from *Julus*, as a sea Lobster from a *Crevin*. They are indeed like to one another, but these are alwaies less, nor are they so mischievous when they bite, nor so venomous.

The Name.

The great earth Scolopender is as long and thick as you have it pictured; the colour of the body is black from brown, and shining. To every incision a yellow little foot is joyned, that is, in the several sides sixty. It goeth forward and backward with equal ease. For it goes with the head forward, and with the tail forward; and therefore *Nicander* and *Rhodoginus* call it two heads. It hath the part between the head and belly not single, but manifold; whence it comes to pass that this kinde can live though it be cut in sunder. This Scolopender being provoked bites so sharply, that *Ludovicus Armarus* (who gave me one brought out of *Africa*) could scarce endure him to bite his hand, though he had a good glove on, and a double linnen cloth; for he strook his forked mouth deep into the cloth, and hung a long time, and would hardly be shaken off.

Another was brought from new *Hispaniola*, which had on the midst of the back a flame coloured line to adorn it; and a red side, and colour of the hair set it forth. It had feet like to hairs, and lifting it self upon them all, it ran very swiftly: this is worthy of the greatest admiration, that Nature having given to this creature a small head, yet it hath given memory to it, and the rule of reason, not in pints and pitchers, but in the largest measure. For seeing it hath feet innumerable as Rovers, and many of them are from the Rudder the head at a great distance, yet every one knows his own office, and as the head directs, so they all frame their motion.

Uuuu

Another

Another was brought to us from St. *Augustines* Promontory out of *India*, something greater in body and feet: which had 70 black and blew incisions, and twice as many light red feet.

I doubt not but more sorts of Scolopenders may be found, of almost all colours except green; yet *Ardoynus* makes mention of one that was green. Each of them hath an inbred property, to go to the roots of sword grafs (as *Theophrastus* thinks). But *Robertus Constantinus* deserves to be whipt, and so doth *Stephanus* that follows him, and *Ardoynus* himself, who invent that a Scolopender is first a Serpent, then hath eight feet, then a horn in its tail, and lastly, it is a slow goer. *Albertus*, *Rhodoginus*, *Avicenna*, are to be blamed also, who affirm rashly, that no Insect hath above twenty feet, and they put the Scolopender in that number. Yet *Nicander* calls him two headed in these verses:

*The Scolopender hath each end a head;
And stings with both, untill that men be dead:
With feet like ores he wafts himself along, &c.*

Yet by the favour of so great an Author, I might say that he hath but one head; though he can as easily move forward or backward with his tail conducting him, as with his head. And this I believe deceived *Nicander* and others. But he saith farther, that he bites at both ends; which is as false as the former; for he bites only with his forked mouth, and hurts not with his tail, otherwaies than by a venomous touch, and by putting forth poysonous bloud.

Oppianus holds it to be more fierce than the sea Scolopender, and so it is indeed: and I greatly wonder that *Grevinus Parisiensis*, upon no authority, in his Book of Venomes should oppose this.

All Histories testifie that this creature is dangerous and venomous, and so much the more as it is more hairy. We read in *Ælian* that the *Rhytenses* were driven out of their City by the multitudes of these creatures: and *Theophrastus* affirms the like concerning the *Oberietes* in *Pliny*: therefore though we have ranked the Scolopenders in the last place, yet in executing divine vengeance, they may sometimes challenge the first place. Countrey people do judge of fair weather by the frequent coming forth of the Scolopenders; and when they hide themselves they foreshew rain, as *Marcellus Virgilius* hath noted on *Dioscorides*. They have these uses in Physick. If they be boyled in Oyl, they take off hair with a little pricking, *Gal. 11. Simpl.* and *Actius lib. 7.* They are enemies to Wiglice, that are most stinking creatures, and kill them with their breath, or eat them alive. Again, Wiglice being either taken inwardly, or anointed outwardly, are a remedy for their bitings, by a reciprocal, and as it were emulating antipathy, as is manifest from *Pliny*, and *Ardoynus lib. 6.* concerning poysons. When the land Scolopender hath bitten, the place is all black and blew, putrefies and swells, and looks like to the dregs of red Wine, and is ulcerated with the first bite. *Ægineta*. *Actius* adds that the pain is intolerable. *Dioscorides* saith the whole body pricks. All hold that this bite is incurable, and will admit almost no remedy. It hath (saith *Anazarbens*) symptomes, prevention, and cure, the same as for the stinging of a Viper, *lib. 6. c. 23.* Against this disease some things are taken inwardly, some things are applied outwardly.

Amongst inward Remedies, *Ægineta* commends Trifoly that smells like Bitumen, drank with Wine. *Dioscor.* approves much of wild Rue, the root of Dragons bruised, the root, seeds, and flowers of Asphodill, the branches and leaves of Serpol, Calamint, the roots of Fennel and Birthwort, given with pure Wine, or Wine and Oyl. *Actuarius* gives Nix with Wine. *Pliny* commends Salt with Vinegar, or rather the froth of Salt as being the better. Also he highly esteems of Horse-mints, or wilde Penniroyal taken in Wine. *Actius* bids give Wormwood and Mints with Wine.

As for outward Remedies, first scarifie the place hurt, make deep incision, and draw out the venome by Cupping-glasses; then put in the juice of the lesser Centory, boyle with a third part of sweet Wine to the consistence of Honey, and binde a leather over it for eight or fourteen daies. Then foment the place with a sponge dipt in hot Wine, and this is a certain cure for the bite of a Scolopender. *Anonymus*. *Pliny* also prescribed divers remedies for it, as the dregs of Vinegar, washing the place with Vinegar, the flower of Miller with liquid pitch, Butter with Honey, the green Figs of the wilde fig-tree with Vetches and Wine, the Urine of the patient hurt and of a Wether, burnt Salt anointed with Vinegar and Honey, wilde Penniroyal with Salt, Salt with Tar and Honey, wilde Cummin with Oyl; and all kindes of Maiden-hairs. *Dioscorides* commends Garlick, with Fig-leaves and Cummin, and with Vetch Meal and Wine, also the leaves of Calamint, and burnt Barley with Vinegar; also he commends a Fomentation made

of

of sowre Pickle: *Archigenes* bids foment the part with Allum-water: *Agineta* saith, with much hot Oyl. *Nonius* prescribes hot Oyl of Rue.

Some commend exceedingly both outwardly and inwardly such things as are given against the biting of a Shrew. *Aristotle* writes that the Scolopenders are deluded and drawn forth with the fume of liquid Storax, and are easily taken whilst they stick to the clamminess of it.

Of the Juli.

THE kinds of the Juli follow next: which the Greeks call *Ἰούλι*; and that as I think not from their down, but from the tails of Walnuts and smal Nuts, whose hair being fastned in a hard substance, represents these Cats-tails, whence they had the names of Juli. I know the Latines call them *Juli*, but I should call them *Galleys*. For *Lycophron* called the *Galleys* of *Paris* that were swift with many ores, *Ἰουλίτες*. *Nicander* applies the same similitude to Scolopenders; whence it may easily appear, that Juli and Scolopenders are like one to the other. The Spaniards call these *Centopeas*: the Italians, *Centogambi*. It may be the English after me will call them Gally-worms: *Numenius* also called earth-worms black Juli, as *Athenaeus* witnesseth lib. 7.

Black Juli that feed on earth are called the earths bowels; yet unless they have many feet, they cannot be numbred or named amongst the Juli. Juli are as I said, short Scolopenders, that for the number of their feet, exceed not only Hoglice, and all Carterpillers, but also all other Insects. Some Juli are smooth, others hairy. I saw a smooth one in a Cabbage Lettice

as thick as a small river bulrush, and of the same magnitude you see it here: it had a very black head, the back was of a golden colour, the belly was silver coloured from gray, the incisions and hairy feet were so many that they easily overcame both the eyes and memory. The second was all black, except a white line, which was drawn down the back, straight from head to the tail. The third was a decayed yellow, his head and feet were red, the sailyards, and the hairs growing near the tail, were black and blew. If you paint the fourth with a body blackish red, and his feet and sailyards lighter, you have rightly set him out: we caught some of these coming forth of moss growing on the barks of trees, and others lurking under trees and rotten logs. I could meet but with two hairy ones. The first was white of this form and figure, it crept on a wall, the short hairs that grew on

were black. The second had a black and blewish belly, and a back spotted with an uncommonly yellow. The mouth was red, a black eye, the hairs were hoary. It lies hid in old decayed trees between the bark and the wood; and also amongst stones that are overgrown with mosse and thick downy hair. All these Gally-worms, if they be touched roll themselves up, and become round. I cannot tell whether they are venomous or not, but if they be, *Ohappy Pennius*, who divers times with his bare hand provoked and killed them, and yet was never bitten nor hurt by them. *George Agricola* tells us of a Gally-worm of a brazen colour (but he calls it a Scolopender) his words are these: A little Scolopender is bred and lives in the logs of trees, or in posts driven into the earth, (whence it hath its name) remove these or stir them, and it will come forth; otherwise it alwaies lurks there. It hath no feathers, but hath many feet: when it creeps it lifts up the middle of a body like a vault: if you touch it with a little wand or any other thing, it rolls it self together. It is of a brazen colour, a slender body, not broad, but three fingers long, or at most four.

Also it is found in another form, almost in the very same places, with a slender round body, the thickness almost of a thread, of an allayed bright bay colour, the feet are so many and so small, that it is impossible to number them. It is four fingers broad in length; it remains under rotten trees and plants. *Avicenna* makes the Scolopender (which is also a Gally-worm) to have 44 feet only, and to be the palm of ones hand long; so small and slender, that it can creep into the ears. *Lib. 4. Fen. 6. tract. 5. cap. 19.* This creature, saith he, hath no venome, or but very weak, and causeth no great pain: which is presently taken away with the flowers of *Asphodils*, or with Salt mingled with Vinegar. Our Gally-worms (saith *Gesner*) if they be in the houses, they will come together to *St. Thomas Sugar*, that is the most pure, (as Mice do to the best Cheese). Our Countreyman *Bruerus* (a skilful and laborious searcher of Nature) reports that he hath seen here in *England* Scolopenders, and kept them, that shined in the night, and in mossy and broomy grounds shined with their whole body: who was no lier, and I willingly give credit to him; and so much the rather, because *Ovidius* saith he observed the same in new *Hispaniola* in the fields, and *Cordus* did the like in *Germany* in moist cellars. It seems strange that *Plutarch* relates, *Lib. 8. Sympof. problem. 9.* that a stripling at *Athens* cast up a small ragged creature, together with a great deal of seed: it had many feet, and walked exceeding fast.

The Gally-worm found in cellars, burnt to powder, doth wonderfully provoke Urine. *Me-The Use.* The blood of Gally-worms, with the moisture pressed out of Hoglice, is a divine and excellent remedy to take away the white spots of the eyes. *Arnold. Brev. 1. cap. 18.*

them into moist white Ashes, and then give them with Honey. *Pliny* saith they cure short breaths 21 being bruised with Athenian Honey, and with little hot water, drank through a reed, that the teeth and mouth may not grow black. *Aetius* for the same infirmity, gives five or six with Hydromel. And *Marcellus* the Emperick reports, *cb. 35.* that 21 Hog-lice stamped with the best Honey, and drank with water, will cure short windedness, purpiveness, and such as are almost choked, and the Leprosie also, beyond belief. *Pliny* writes that they are good in drink for Consumptions, who farther maintains, that a penny weight of them given in three ounces of Wine to drink, will cure the pains of the loyns and hips. *Alexis* of *Piemont* subscribes to this; but *Calius Aurelianus* dislikes this, and the like remedies from Insects; being so perswaded from the unusualness of such remedies, rather than from any hurt or inconvenience that proceeds from them. Experience confirms that many fresh Hog-lice well bruised and drank with Wine, Ale, Beer, or any convenient liquor, or applyed but outwardly, can cure almost all diseases of the eyes that arise from any thing growing in them, or growing to them, (except the Cataract) which we observed in the former Chapter out of the Breviary of *Arnoldus*. For a Quinsey, saith *Galen*, *κρ ππ.* they must be licked with Honey, and the outside of the throat must be anointed with the same. Hog-lice boyled with oyl of Roses and heated in a Pomegranate shell, and poured into the ears that are pained, do cure them. *Dioscorides*. *Gal. lib. sec. loc. & Eupor.* commanded to boyl 2, 3 or 4 in oyl, and to press out the oyl and drop it into the ears of those wee deaf, or had pains or tinklings in their ears. Oyl of Chisleps dropped into that ear is next an aking tooth takes away the pain certainly, that ariseth from a hot cause. *Aetius* 24. 27. Some mingle them with some convenient unguent and drop them into the ears. *Severus* (saith *Galen*) poured them into ulcerated ears with good successe. *Faventinus* prescribes 21 Chisleps boyled in sower Oyl, for pains of the ears proceeding from cold: in which he shews that they must be anointed about the ears, and a little must be dropped in. *Cardan* justifies the same remedy by experience. For Wens, *Pliny* takes a fourth part of Rosin or Turpentine to the dunghil Chislep, by which Medicament (saith he) swellings under the ears, Kings-evils, and all such tumors are cured. *Marcellus Empericus* hath the same, and *Avicenna* 2.2. *cap. 729.* and from the authority of others, he adds, that Chisleps taken in drink, cure the Cramp, and Aluczes, which we have never known any to have said besides. If you often apply Oyl or Butter of Hog-lice to a pained head, you shall cure the pain. *Gal. Eupor.* 2. 91. and *Abysrtus de quadrup.* Bruised, they cure the Tonfils, and the diseases of the chops, *Dioscor.* A live Chislep laid to a whitloaf, cures it; and it takes away swellings, if it be laid on with a third part of Rosin or Turpentine. *Pliny*. Take Unguent populeon j. ounce, Oyl of Roses wherein Hog-lice have been boyled j. ounce and half, Saffron iv. grains, mingle them and make an unguent, that is a most noble cure for the Hemorrhoids, that swell and are painful. Others (saith *Alexander Benedictus*) boyl these Chisleps with Fat or Butter, then they put to it the yolk of an Egg; and with this they assuage that cruel pain. *Pliny* saith, they cure all hardness of wounds, and Cancers, and Worms in Ulcers, being mingled with Turpentine. And to conceal nothing from you, I thought fit to add, that *Pennius* himself lying sick of the Asthma, used for a long time Hog-lice steeped in Wine: but having done it alwaies to no effect, by my advice at last he did twice or thrice take in the smoke of Brimstone through a tunnel, and he grew perfectly well from that horrid symptome. Take oyl of Violets iij. ounces, wherein let four Chisleps boyl till a third part be consumed: it restrains a salt humour, being outwardly anointed. An incertain Author. Hens, water Lizards, land Frogs, and Serpents feed on Chisleps, as *Theophrastus* writes. *Ambrose Pareus*, a Chirurgeon of *Paris*, relates that one vomited a small living creature like to a Chislep: and such a like thing *Solerius* hath written concerning a certain woman, upon the second Book of *Aetius*.

CHAP. X.

Of Land Scorpions.

IT is called *σκorpion* in Greek, from scattering its venom, or as others wil have it, because it creeps lamely. Also *שׂרפ* signifies a Scorpion, or a kinde of Scorpion, whereof *Nicander* speaks in his Theriacks, the burning Scorpion must be pressed down when he creeps upon his feet, being a deadly creature. It is doubtful whether this be a kinde of Scorpion; it hath legs or clawes, and a sting in the tail. The Latines call it *Scorpius*, and *Pliny* *Scorpio*; *Cicero*, *Plautus*, *Varro*, and *Nonius*, call it *Nepam*, which name *Columella* useth often. In Hebrew it is called *Acrab*, and *Cancrab*, because it pricks those that tread on it. In Arabick it is *Natarab*, *Achrab*, *Necharab*, *Hacharab*, *Acrob*. *Rhasis* calls it

Couches, *Pandaetarius*, *Satscollen*; in Spanish it is *Escorpion*, or *Alacram*; in Italian, *Scorpione*, *Scurdificio*; in High Dutch, English, French, Brabant, it is called a *Scorpion*; in the Slavonian language, *Niedaradeck*; in Illyrium, *Istir*; in Danish, *Wollocow*; in new Hispaniola, *Alacrant*.

But that which hath a bunch on its back and drawes the tail after it rolled up, *Silvaticus* calls *Algararat*. It is an Insect with a body of the fashion of an egg; as it were smoked all over, at the bottome a tail comes forth, joyned with many round knots, the last as it seems longer than the rest, so that only is armed with a simple or double sting, and semething bended backward toward the end: it hath eight feet, and legs forked with claws; and strong pinfers; it hath a head as the others have, lying hid in the top of its brest, wherein you can perceive very small and almost no eyes; that Authors do scarce mention them. All Scorpions have tails, or no tails. Some of the tailed Scorpions are fenced but with one sting, but others with two; yet they do not differ in kinde and nature. *Nicander* describes seven kinds of land Scorpions. The first is white and not deadly. The second (saith he) hath a red mouth, from

whole sting ariseth vehement heat, feaverishness, and intolerable thirst. *Alian* saith the same. The third is wan and blackish, whose sting causeth a shaking palsey, and a Sardonian laughter, and vain, like to that of fools. The fourth is of a colour inclining to green: this so soon as it hath stung a man, a cold and shivering possesseth him, so that in the hottest Summer he will suppose himself covered with frost. This kinde hath many knots between seven or nine, which is also the cause that he wounds so deep, by reason of the length of his tail. The fifth is black and blew, or of a pale colour, of a large stretched out belly, for it feeds on grasse, and is unsatiable. It not only stings with the tail, but also bites with venom'd teeth. *Nicander* calls its poyson *Belopass*, because a Bubo riseth on a man that he stings. The sixth is like to a shore sea-Crab, yet not without a tail, but with a greater body and almost round, so that it represents a Crab with a tail. *Matthiolus* saith that he saw of this kinde some that were black, murrey and green in the County of *Arcinna*, not far from the River *Sarcus*. The seventh is like a Grampel: also it hath claws greater than that; and this kinde is produced by Crevis on the dry ground, that are entred into some hollow places to escape the Fishermen: in which places if they die or corrupt, these kinde of Scorpions grow from them: as *Ovid* most elegantly hath set it down:

Take off the claws of Crabs that use the shore,
And from their bodies with earth covered ore,
A Scorpion grows threatening with crooked sting.

Alian calls this the flame-coloured, for it is like the Crab that becomes red with boyling. There is another kinde of Scorpion which we call *Rhasis*, and the Arabians *Scorpion*, for *Nicander* and the Greeks never saw it: it is very bunchy, and runs swiftest of them all: it hath a tail for its small body that is very great; it seems to be pale, but the sting put forth is very white: *Rhasis* calls it *Fararets*; *Albuchasis*, *Grati*; *Avicenna*, *Algeraratie*. It is found in the Eastern Countreys, especially in *Cora*, and in *Hascari*, as *Gordonius* notes. Philosophers say that the stings of other Scorpions infuse a cold poyson: the Arabians say that only this one, infuseth poyson that is hot. I saw one brought forth of Barbary, and we here give you the picture of it. The sting of all the tailed Scorpions is hollow, whereby they cast poyson into the wound: as *Alian* reports l. 9. c. 4. To which *Pliny* subscribes, lib. 9. cap. 37. and *Nicander* in his *Theriacks*. Yet our *Galen* is of another minde, lib. 6. de loc. aff. c. 5. where he speaks in these very words almost, to those who ascribed a specifical quality of hurting or helping to humours or vapours. But the sting of the Scorpion deserveth much more to be admired, which in a very short time causeth extreme symptoms; and that which is injected when it stingeth, is either very little or nothing at all, there appearing no hole in its sting: And indeed, when we see that from the teeth pricks and stings of some creatures, fishes or plants, there is solid poyson conveyed into the wound by them; what need we fly unto secret bladders, and perchance such as were never seen, that lie hid under the root of their stings, such as fruitful wits have rather invented, than solid judgements and those that were studious for the truth? As I said, they have all six feet, besides the claws that are their fore-legs, as crabs have, (which I should more willingly call arms) some of them (if you look narrowly) are forked: their tail consists sometimes of 6, 7 or 9 knotted joynts: in the end of the tail is one hollow sting, two sometimes, (but that is more seldome). If it had its sting any where but in the tail (saith *Aristotle* lib. 4. *Histor.*) because it moves it self by steps, it were unuseful to sting withall: *Alian* saith, that its sting is very small, and scarce visible: out of whose invisible pipe, if there be any, such a venomous spirit, or moister humour is poured in by a wound made, that is scarce perceived or sensible. It walks side-waies as Crabs do, alwaies moving the tail ready to strike, that no opportunity may be let slip. The Males are the fiercer, slenderer, longer, and more spotted on their bellies, claws and stings. The Females again (as *Avicenna* well observes) are greater, fatter, greater bellies, and milder. The poyson

son of the Male is also more dangerous, as *Pliny* thought, the Female is more gentle; but all their venome is white, unless *Apollodorus* deceive us. It is apparent that they which have seven or nine joints on their tails, are the most curst: many have but six, it strikes athwart and bendingly. All of them have their poyson more violent at noon day, and in Summer, when they are hot with the Sun-beams, and when they are thirsty and are unsatiable for drink. The plague of it seems intolerable, and which with a heavy punishment destroys a man with a lingering death in three daies. Their stinging is alwaies mortal for maids, and most commonly for all women: and for men in the morning, before they have cast out their venome by some accidental stroke, and are new come forth of their holds. It is the property of Scorpions, that they will not sting the palm of the hand nor smooth parts, and no where unless they feel the hair. Scorpions, as *Pliny* supposeth, will hurt no living creature that wants blood: which *Dr. Wolfius* of *Turin* a most learned Physician hath proved to be false: for he saw, as he reported to *Pennius*, a Viper shut up in a vessel with a Scorpion, and they killed one another with mutual bitings and stings. And *Ælian* writes, *l. 8. c. 13.* that they do fight and contend with Vipers, and all kinde of venomous Insects for their meat: *Gesner* saith it is certain that a Viper will devour a Scorpion: and from thence his bite will be the more grievous. Also *Theophrastus* writes that by the sting of Scorpions Serpents will dye, and not men. But *Galen* depending on experience, hath proved it to be false, and appeareth it for a lie. *Pennius* shewes the fraud of *Ælian*, relating, *lib. 6. c. 23.* the wonderful fraud of Scorpions: but since I observed the same in *Italy*, I will maintain the truth of the Author, and free him of it. We know that the skill men have in that Countrey, they employ it all to escape from the Scorpions: whereupon they use sandals to defend themselves, and hang their beds on high from the ground, they place the props or supporters of their beds far from the wals, and set them in vessels full of water, and many other inventions they have to deceive or to destroy the Scorpions. But the Scorpions get up to the roofs of houses, and if they can finde any tyle broken they will remove it, and one of the strongest of their Captains, (trusting to the force of his claws) hangs down by this chink, and his tail hanging down, then another upon his back comes down as by a ladder, and takes hold by the others tail, and a third takes hold of the seconds tail, and a fourth by his tail, and so the rest, until such time as by links they can reach the bed, then the last comes down and wounds one that lies asleep in his bed, and runs back again by the links of his fellowes, and so all the rest in order shift away, unloosing as it were the chain, untill they are all got up again upon one anothers backs. Also *Clem. Alexand. 1. Stromat.* makes mention of this property. But they are not all venomous, nor do they hurt or sting all men alike. For they do not live in *Sicily*, and if there be any there, yet they do no hurt; and therefore the *Pisilli* lost their labour when they undertook to free *Italy* from this mischief that was a stranger to them, in hopes of gain. *Plin. lib. 11. cap. 25.* *Aristotle* writes of the same thing concerning *Pharos lib. 8. Histor. c. 29.* of the Island *Malta*, *Diodorus lib. 4. cap. 3.* of the Countrey *Noricum*, *Joseph. Scaliger, exerc. 189. 5.* where you shall come in no place but you shall finde abundance of them, and yet they either sting not at all, or else there is no danger unto men by it. But now in *Egypt*, *Sicily*, *Africa*, and *Albania*, they wound mortally, as we read in the Books of *Alexander de Alexandro*, *Pliny*, *Dioscorides*, *Strabo*. In *England*, *Scotland*, *Ireland*, and *Gascony*, Scorpions cannot live, nor in the colder Islands more Northward. For though they cannot well bear the heat of the Sun by day, and therefore lie under stones all day; yet it seems they want no less heat in the night, for love whereof they come not only into chambers, but get into feather beds, and lay themselves down sometimes close to those that are asleep. Men report many things concerning the Countrey of *Trent* set free from the deadly sting of Scorpions by the prayer of *St. Vigilius*. But it is at the Readers choise to take it for a Truth or for a Fable. In *Scythia* it is far otherwise, for there if a Scorpion sting a Man, a Hog, or any Beast or Bird, they are certainly killed. *Cardan* saith that such as wound mortally are seldome bred. But *Marcellus* reckons up an army of desperate symptomes that happen there, especially in *Hetruria*, by the stings of Scorpions, sometimes joyned with death. And *Ælian l. 8. cap. 13.* reports that in *Æthiopia* mens lives are not only endangered by the stinging of the Scorpions; but if they do but tread on their excrements, their feet blister, and they can hardly be cured. He calls these Scorpions *Sibrittas*, they feed on Vipers, Blind-worms, Lizards, Spiders, and other venomous Insects: whence they are so forcible with poyson, and have a kinde of graduation (that I may use *Paracelsus*) in the use of it.

Aristotle speaks of some Scorpions in *Caria* that are very loving to strangers. (*Ælian* reports that this is about *Latmus* a mountain of *Caria*, where they are sacred to hospitable *Jupiter*, and do not sting any stranger; or if they do, they do them no great hurt, but they kill the inhabitants presently when they sting them. A Lion whensoever he sees a Scorpion flies from him as from an enemy to his life: witness *Physiologus* and *St. Ambrose* gives credit to it. Men say that such are never stung by Wasps, Hornets, or Bees, who are stung by a Scorpion. *Pliny*. Their Generation is twofold, common by Copulation, more seldome, (so far as we know of it) from Putrefaction. Some maintain that they are not bred by copulation but by exceeding heat of the Sun. *Ælian lib. 6. de Anim. cap. 22.* amongst whom *Galen* must first be blamed, who in his Book *de fet. form.* will not have Nature but chance to be the parent of Scorpions, Flies, Spiders, Worms, Nature of all sorts, and he ascribes their beginning to the uncertain constitutions of the Heavens, Place, Matter, Heat: but doubtless they do copulate, and they produce little worms alive (which I have

have seen) they are white and like to eggs, and they sit upon them to hatch them. So soon as their young are brought to perfection by them, they are driven away by their young, as it falls out with Spiders also, (especially those are called *Phalangium*) and they are destroyed by their young ones in great numbers. Scorpions are fruitful creatures, for oft-times they bring forth eleven. Some also suppose that they devour their young (namely *Antigonus*), but only one that is more cunning than the rest, which hides it self about the dams legs, and so escapes the danger of its sting and biting. This afterwards revengeth the death of all the rest, and kills its parents from above. They bring forth twice a year, namely in Spring and Autumn. The original of Scorpions from putrefaction is more rare, and it is many waies. For they are bred from Crevis corrupted, *Pliny lib. 11. cap. 25.* and from the carcases of the Crocodile, as *Antigonus* affirms, *lib. de mirab. hist. cong. 24.* For in *Archelans* there is an Epigram of a certain *Egyptian*, in these words :

*The carcases of dead Crocodiles is made the seed,
By common Natures whence Scorpions breed.*

L. 10. c. 12.

Aristotle adds further, that from water Mints corrupting, Scorpions are bred. And *Kiramides* and *Pliny* say they breed of Basil. An *Italian* that delighted much in the smell of Basil, a Scorpion bred in his brain, which afterward caused most vehement, and long during tortures, and lastly death. *Hollerius, lib. 1. cap. 1.* of his practise. *Gesner* heard as much of a French maid, as he testifieth with his own hand writing. Doctor *Banchinus* second to none for Anatomy, reported to Doctor *Pennius*, that he hid Basil in a wall at *Paris*, and after a certain time he found two Scorpions in the same place, *Chrysippus* therefore not without cause, dispraised Basil to many men. There are some that maintain that if a man eat Basil the day he is stung with a Scorpion, he cannot escape death. Others say, that if a handful of Basil be bruised with ten sea Crabs or river Crabs, and be left in a place where Scorpions haunt, all the Scorpions will come about it. *Pliny lib. 20. cap. 12.* But *Dioscorides lib. 2. 135.* and *lib. 32. cap. 5.* saith that Crabs will kill Scorpions, if they be put to them with Basil. *Albertus Magn. lib. 19. anim. cap. 18.* Some are of *Avicenna's* opinion that they breed of corrupt wood, and are made many waies.

The place conduceth much to their generation and production. For in *Hispaniola*, the *Canaries*, *Numidia*, *Scythia*, *Pescara*, *Barbary*, *Ethiopia*, there are such multitudes of Scorpions, that the inhabitants are oftentimes forced to forsake their habitations : *Oviedus*, *Thevetus*, *Leo Afer*, *Pliny*. The Countrey about the Lake *Arrhata*, in the *East Indies* near the River *Estamenum*, is so fruitful and so pestered with Scorpions, that the inhabitants not knowing what course to take, left the place to them. *Alian lib. 17. cap. 40.* When you are two daies journey from *Susa* in *Persia* into *Media*, you shall light upon an infinite number of Scorpions, whereupon the King of *Persia* being to ride that way, commands the Citizens three daies before to hunt the Scorpions, and assigns a very great reward for those that catcht most of them. If he should not do so, by reason of the multitude of Scorpions lying under every stone, there could be no passage. *Alian. lib. 15. cap. 26.* The *East Indies*, as *Agatharsis* testifieth, and *Africa* also, breeds abundance and very great Scorpions, which also wound with their stings as the others in *Europe* do. The Scorpions of *America* are the smallest of all, yet the most venomous, next to those of *Africa* : their poyson works so suddenly, that it immediately flies to the heart and kills the party that is stung. The people of *Noricum* near the *Alpes*, have in their Countrey many Scorpions, but (which is wonderful in Nature) they are all harmless, as *Scaliger* affirms. In *Pharos* also, and the Territory of *Avarrium*, the Scorpions (as we said before) do no hurt. In some places of *Helvetia* (as about *Rappiswil*) there are found very small Scorpions, and innocent. *Gesner*. So it is also in some Countreys of *Germany*. In new *Hispaniola* there are a great many Scorpions, but not very venomous ; there is some pain that follows their stinging, but it is not great, nor of long continuance, and men are more hurt by the stings of Wasps or Bees : unless it were so that the Scorpions were fasting, or newly wounded. *Manardus*. But the Scorpions in the Island *Ferrara* (which is one of the fortunate Islands) and *Coptum* in *Egypt*, cause great pain, and their Venome is mortal. In *Castile* a Countrey of *Spain*, the countrey folk oft-times whilest they plough up the ground, do finde innumerable Scorpions, clustered together like *Pismires*, where they lye hid all the winter. *Matthiolus*. The colder Countreys have no Scorpions, as *Gascony*, *England*, *Ireland*, *Scotland*, *Denmark*, and great part of *Germany*, or if there be any there, they are not venomous. *Alian* reports a wonderful thing concerning the Priests of *Isis*, which in *Copto*, a City of *Egypt*, where there are abundance of deadly Scorpions, they can tread upon them, and cast them on the ground, and yet receive no harm by them. Also *Psylli*, a people of *Africa* cannot be hurt nor stung by Scorpions. For when they come to any venomous creature, it presently becomes stupid, as if it were charmed or struck dead, that it cannot move. Also all their Hogs, but not the black ones, (for if they be stung they die presently) are free from their stings. Lastly, a Scorpion nor any other venomous beast, doth not hurt a *Stellio*, an *Ascalabotes*, a Crab, a Hawk, as *Galen ad Pisonem*, and our friend *Gesner* have observed.

Their Food.

Their Use.

They live by eating the ground, and in some places they feed on Herbs, Lizards, Blinde-worms, Whurles, Beetles, and all poysonous beasts. *Alian*. But he that shall tread on the excrements will have his feet blistered. The Hens, Ibis, Vipers eat abundantly of them, whence *Aristotle* calls the Viper *απομύαζος*. And they are not more fit for their food, than they are a remedy for

for us. For being laid to their own wounds they made, they cure them, as is generally known. Their use in
 Also a Scorpion bruised resists the poyson of a Stellio. *Pliny*. Some bruise them and drink Physick,
 them in Wine, casting away their tails. Others lay them on burning coles, and perfume the
 wound, and then strew the Scorpions ashes upon it. Some binde them to the wound, being brui-
 sed with salt, Linseed, and Marsh-mallows. Against the Stone, *Lanfrancus* his powder: Take
 20. live Scorpions, close them in a pot with a narrow mouth, and with a soft fire burn them to
 ashes, which is a wonderful remedy against the Stone: A Scorpion torrifed and burnt to ashes
 and taken with bread, breaks the Stone of the bladder. *Author ad Pisonem*. Three Scorpions
 closed in a new earthen pot, and covering it with a cover well luted, with a fire made of Vine
 branches, bring them to ashes in an oven; the Dose is 6 grains with syrup *de quinque radicibus*:
 it wonderfully drives forth stones of the kidneys. New Authors exceedingly commend the ashes
 of Scorpions amongst the remedies against the Stone, and the oyl of them injected into the bladder,
 and anointed outwardly. *Alexand. Benedictus, Aggregator, and Leonellus Faventinus* out of *Galen* (*Eu-
 por. 3*) teach us to burn three small Scorpions, and to give their ashes in syrup, or a decoction, or
 some confection proper for it, to break the Stone. And *lib. 2.* he bids us to mingle them with fat,
 being calcined, and so to exhibit them; because otherwise the Patients would abhor the eating of
 them, wherefore they may be given without suspicion. That Medicament of *Abolans*, that *Arnoldus*
 praifeth so much, is made of the ashes of Scorpions, as you may see in *2. Breviarii cap. 18.* as also the
 admirable syrup of the King of France against the stone, which is described in the same Book and
 Chapter. *Rondeletius, capite de calculo*, in his practise, maintains that a Scorpion is cold, and
 therefore to drive out the Stone we must use the compound, and not the simple oyl of Scorpi-
 ons. *Matthiolus* teacheth to make that compound oyl, *Commentar. pag. 1407. 20.* But be-
 fore him, *Luminare Mainus*, made that after this manner. Take round Birthwort, roots of
 Gentian, Ciperus, Barks of Capers, of each j. ounce, oyl of bitter Almonds j. Kist, let them stand
 in the sun 30 daies; then add to it 15 Scorpions, and shutting the vessel again very close set
 them in the sun so many daies as before. Then strain the oyl and keep it for your use. Others
 prepare it thus: Take old Oyl as much as you please, put as many Scorpions into it as you can
 take in July (for then are they most venomous and fittest for this remedy) add to them whire
 Dittany, leaves of Wormwood, Betony, Vervain, Rosemary, of each j. handful, set them a sun-
 ning for a long time, then distil them in balneo in a Limbeck. It is called St. Bernards Oyl. It
 powerfully provokes urine. Anointed on the groin, it is prevalent against the bitings of Scor-
 pions, how venomous soever. It drives out worms miraculously. *Brassavolus*. Of Oyl of Scor-
 pions and Vipers tongues, is made a most excellent remedy against the plague, as *Criminus* testi-
 fies, *1. 7.* *Manardus* saith that Oyl of Scorpions is now made with old Oyl, adding many
 medicaments thereto commended against poysons, and it is admirable in the plague, and against
 all venome. I know a man that having only this remedy, made no reckoning of the greatest
 plague; and had not only preserved himself but his servants also, whom he sent to visit people
 that were sick of the plague; and I know very many that escaped only by anointing themselves,
 having drank the most deadly poysons. So sayes *Manardus*. A liniment of Scorpions against
 the plague, and all poysons, is described by *Fumanellus, lib. de cur. pest. cap. 12.* A Scorpion is
 good also against a wound given by a Viper, saith *Galen 1. de simpl. Samonicus* commends them
 highly against pains in the eyes, in these verses:

If that some grievous pain perplex thy sight,
 Wool wet in oyl is good bound on all night.
 Carry about thee a live Scorpions eyes

Ashes of Coleworts if thou do apply,
 With bruised Frankincense, Goats milk, and Wine,
 One night will prove this remedy divine.

If any one troubled with the Jaundies take Scorpions bruised in Wine and Honey, *Galen* saith he
 shall quickly finde help. *Kiranides*, against a Quartan ague, Quotidian, or Tertian, prescribes a
 Scorpion put into a glasse of Oyl about the wane of the Moon, and kept there; and with this
 Oyl anoint the whole body on the joynts, and the soles of the feet, and the palms of the hands,
 very well before the coming of the Ague. *Plinius secundus* saith, that a Quartan Ague, as the
 Magicians report, will be cured in three daies by a Scorpions four last joynts of his tail, toge-
 ther with the gistle of his ear, so wrapt up in a black cloth, that the sick patient may neither per-
 ceive the Scorpion that is applied, nor him that bound it on. But let these superstitions pass,
 and we shall speak something of Antidotes against Scorpions.

First therefore of *Prophylacticks*. Magicians deny that a Scorpion can pass over if he be com-
 passed in with a branch of Turnsole: and the herb laid upon him kills him. *Pliny*. A smoke made
 with Brimstone, Galbanum, and an Asses hoof, drives away Scorpions. *Rhasis*. Take Storax, Arse-
 nick, Sheeps dung, fat of the caul of Sheep, equal parts, dissolve them in Wine, and make a fume
 by the holes of Scorpions. If a Radish cut be put into their holes, they will not come forth. A
 Scorpion burnt is good, the live of an Ass, Sandarach, with Butter or Goats suet to make a
 fume. *Varignana* and *Diophanes in Geopon.* *Rhasis* commends the root of Elecampane carried
 about one. *Macer* writes of Honseck thus:

Preventions
 against the
 stinging of
 Scorpions.

Men say that Honseck hath so sovereign a might,
 Who carries but that, no Scorpion can him bite.

Cure of the
stings of
Scorpions.

If a man anoynt his hand with an herb called *Paris*, or with the juice of the root, he may safely take a Scorpion in his hand. *Flaminius*. Grapes preserve men from the stings of Scorpions, as also Filberds carried in their Purses. *Actius*. Also the seed of wilde Docks either drives them away, or their stinging is not mortall. *Dioscorid*. Who also saith from the *Africans*, that Basil will do the like. Larks spur, and wilde Campions also makes them stupid and attornished: The same Author. And saith he, they report, as long as any man hold Carduus in his hand, a Scorpion will not bite him, or if he do, it will not hurt him. The seed of Wood-forrell drank, preserves one from Scorpions. *Avicenna*. If you lay *Solomons Seal* under you, it keeps off Scorpions. *Isidorus*. And *Pliny* learned from the Inhabitants of *Africa*, that he that carries Radish-root, or Turnsole, or a dried beast like a Lizard about him, Scorpions will not hurt him: So Dittany in smoke, or wilde Mints, or Oyl of Scorpions anoynted about their holes, will keep them from coming into the Chambers. *Rhasis*. But these things will kill them laid upon them: Radish-root chewed, broad leav'd Basil that growes by the water side, Mallowes leaves, black Hellebore, (but the white will quicken them when they are dying, if *Pliny* may be believed) Scorpions grasse, Rose-root, Basil with a red flower, the spittle of a cholerick man fasting. *Rhasis*, *Pliny*, *Avicenna*, *Democritus* in *Geopon*. To cure the sting and wound *Guilielmus de Placentia*, prescribes this in general, namely, to give and apply inwardly and outwardly, presently, good Theriac; then the part affected must be cut, and an actuall Cautey set to it, and the poyson drawn forth with Cupping-glasses. *Galen* bids binde the part above, and to cut off the parts affected. *Gal. 5. de loc. aff. c. 3.* But since that is a very hard and cruel remedy for the patient, I thought fit to write from the Antients what remedies are cures for this wound. You shall first know the stinging of a Scorpion thus: The place is presently red and inflamed, and by turns, (as in an intermitting Ague) waxing cold, and the sick is sometimes better, sometimes worse. He sweats all over, his hairs stare upright, his whole body waxeth pale, his secretes swell, he breaks winde backwards, his eyes run with clammy tears and filth, his joynts grow hard, and he hath the falling of the Tuel, he fumes at mouth, he is drawn backwards by convulsions, and troubled with the Hickop, and sometimes great vomiting, he is quickly weary of labour, he is vexed and troubled with sense of horror, the outward parts of his body are cold, a pricking pain runs over all his skin, sometimes he thinks that hail falls upon him; for *Galen* asking one that was stung with a Scorpion, what he felt, (*3. de loc. aff. c. 7.*) he said he seemed all covered over and almost frozen with hail. *Actius* addes, *μυρμηκων* or warts of the fundament like Ants; after these fainting, then swooning, and finally death. *Actius* writes, that if the lower parts be stung, the groins swell presently, if the upper parts, then the Arm-pits. The wound being now known and viewed, and opened by section, and the generall cure we speak of applyed, whereof Authors are plentifull. *Galen* amongst outward remedies, reckons *Balsamum*, true *Worm-woods*, or the juice of black *Mirtle-berries* anoynted. Also he diversly commends the spittle of one that is fasting, and useth it as a Charm, *lib. 10. Simpl.* And he bids give inwardly the *Balsam with Womans milke*, the *Saphire stone in Powder*, *Assa fetida*, *Scordium*, *Centaury the lesse*, *Rue*, *Castoreum*. Out of *Cassion* the Phisician he commends this: Take *Assa fetida*, *Galbanum*, each alike, make it up with the decoction of *Scordium*, and round Birthwort. The Dose is the big- nesse of a small Nut with hot water. Out of *Andromachus* he commends this, *lib. de Theriac*. Take *Theriac* two drams, Wine four ounces, mingle and drink them.

Dioscorides outward remedies applyed.

Cyprus bruised and laid on.
Amomum used with Basil.
The Milk of the Fig-tree, or the juice of Sage
dropt in, the Scorpion it self bruised.
Sow-thistle beaten.
Succory.
Hawk-wood.
Balm.
Bush-flower.
Mull-berries.
Larks-heels.
The flesh of a Fish called *Smaris*.
The Barbel Fish cut in two.
A Fish called *Lacerta* salted and cut in pieces.
House Mice cut asunder.

Internal remedies from Dioscorides.

Cardamomum.
Juice of Myrtles.
Bay-berries.
Horse or As's dung.
Seed of Campions.
Mullens.

Chamaepitys.
Scorpion-grasse.
Turnsole.
Calamint.
Trifoly.
Scordium.
Lotus rustica. } applyed.
Basil with Barley-flour.
Wheat-meal with Vinegar and Wine.
Marjoram with Vinegar and Salt.
Assa dissolved in Wine.
Sea-water.
Quick Brimstone with Rosin and Turpentine.
Salt with Linseed.
Galbanum made for a Plaister.

Other External remedies out of Avicenna.

Marjoram laid on with Vinegar.
Root of Coloquintida bruised.
Reed roots bruised.
The Shell of an Indian small Nut.
Rams flesh burnt.
Mummie four grains, with Butter & Cows milk.
Decoction of Ameos.

Bras

Bran plaister-wise.
 Wine new boyled.
 Bark of Frankincense.
 The white Thistle.
 White Thorn.
 Pine kernels.
 Dares.
 Figs.
 Mountain Poly.
 Anacardi.
 Ashes of Kaly.
 Wheat Bran boyled with Pigeons dung.
 Salt of Urine.
 Oyl of Wormwood.
 Decoction of Nettles or Chamomile.
 But white Naptha is the principal remedy, laid on hot. It is also good to suck out the venom with ones mouth, unlesse it be first ulcerated, and then to apply such things as inflame, as Pellitory of *Spain*, and Garlick.
 Seed of sower Dock.
 The herb *Phalangium*.
 Daffadil seed and flowers drank in Wine, and also Bramble flowers so taken.
 Parsnip-seed.
 Turnsole.
 Cypress boughs.
 Rue.
 Origanum.

Loveage with black leaves.
 The juice of Dog-fennel } drank.
 Sow-thistle }
 The Decoction of Gentian-root.
 The bark of Birthwort.
 Penniroyall.
 A broiled Scorpion eaten.
 River-crabs raw and bruised, and drank with Asses milk.
 Mans urine drank.

Internals of the same Author.

Juice of Worm-wood with Vinegar.
 Doronicum.
 Cinamon.
 Myrrhe.
 Wilde Saffron-leaves and fruit.
 Citron-seed.
 Mummie.
 Galbanum.
 Roots of Coloquintida and Gentian.
 The *Indian* small Nut eaten, and the Theriac of it.
 The root of Squills eaten, is admirable against the bitings of Scorpions.
 Locusts broiled and eaten.
 Juice of Onions and of Worm-wood.
 Juice of the lesser Centaury.
 Also new boyled Wine helps much.

The Antidote of Anderam, otherwise Braz. the King of Sicily.

Take Castoreum one dram, Scordium two drams, Costmary one dram and half, *Assa fatida* three drams and half, make it up with Honey. The Dose is one dram and half, or two drams with wine.

Another of the same.

Take Birthwort round and long, each one aureus, Cumin-seed three drams, *Assa fatida*, Caraway, Rue-seed, each two drams, Castoreum four drams, make it up with Honey. The Dose is two drams with the hot decoction of Gentian root, or Birthwort, and wine; he gave also two drams of *Assa fatida*, and sometimes three drams, Wood Laurell with Vinegar.

A Medicament of Andro a Greek Philosopher.

Take Rue-seed, live Brimstone, of each six aurei, Castoreum one aureus, *Assa fatida* one aureus and half, Pellitory of *Spain*, liquid Storax, of each one aureus, make it up with Honey. The Dose is half an ounce with Vinegar of the best wine.

Another excellent remedy.

Take Rue-seed one aureus, Castoreum half so much, Birthwort round and long, of each two aurei, roots of Gentian, *Assa fatida*, of each eight drams, (or eight aurei) make it up with Honey. The Dose is one dram and half with pure wine. *The Electuary of Zeno, or Diaruta.* Take *Assa fatida*, bitter Costus and sweet, each five aurei, round Birthwort, Agarick, each two aurei, Castoreum, Cinamon, Aloes, each three drams, roots of Orris, Sarcocolla, each one dram and half, long Birthwort, Gentian, each six drams, make it up with Honey. The Dose is three drams. He commends also the great Theriac of *Andromachus*, *Esdras*, Mithridate, and the *Theriac diateseron*. The description of it is this. Take Gentian, Bay-berries, long Birthwort, Myrrhe, each alike, make it up with clarified Honey. The Dose is one aureus with hot water. *Another against the bitings of Scorpions.* Take seed of wilde Rue, *Ethiopian* Cumin, seed of Trifolie, Minianth, each alike, with Vinegar what may suffice, make a Confection. The Dose is one aureus. *Another.* Take Garlick, Nuts, of each one part, Rue leaves dried, *Assa fatida*, Myrrhe, of each half as much, make it up with milk. The Dose is three drams. *Another.* Take Castoreum, white Pepper, Myrrhe, Opium, of each alike, make Troches. The Dose is three oboli with four ounces of wine. *Another.* Take Opoponax, Myrrhe, Galbanum, Castoreum, white Pepper, each alike, make them up with liquid Storax and Honey. *Another.* Take roots of Coloquintida, of Capers, Worm-wood, long Birthwort, wilde Succory, each alike. Give children one scruple, men one dram, it is of wonderfull vertue in this disease. *Another.* Take green grassewort juice with Cows milk, boyl it like to an Electuary. The Dose is two aurei, they say this helps much. *Another.* Take Opium, seeds of white Hen-bane, make it up with Honey, and mingle it with hotter things to temper it. If any man will have more from *Avicenna*, he shall finde it *Can. 4. Fen. 6. Tract. 3.*

Externall remedies out of Rhafis.

The hot Oyl of Anacardi standing in the shell of an Egge, rubbed in, let the wounded part be first

first bound, then let it loose, and anoynt it with Jefamin Oyl. The third day open a vein, but after meat and sleep. Also anoynt the place with Castoreum, Melanacardium, and Garlick, laying on a plate of lead anoynted with Quick-silver.

Sagapenum applied outwardly heats the wound, and a Weasels flesh laid over it.

Rub the place with a Topaz, and it will be cured.

The wound is bettered by rubbing a Flie upon it.

It may be cured with water from Radish-leaves, and Oyl of Mustard-seed, and Marjoram.

Serapio writes that boyled Butter doth good.

Internals of Rhafis.

Sweat must be procured any way, by external and internal means.

Take Nuts, and Garlick cleansed, of each alike, bruise them.

The Dose is one ounce, and an hour after let him drink wine. Others adde to this a like quantity of dried Rue, Myrthe, and Asa. The Dose is three drams with pure wine.

Another. Take Nigella seed one part, Asa three parts, the Dose is one Trochis, with one ounce of wine.

Another. Let him drink strong Wine till he be almost drunk, and in the morning open a vein.

Another. Take roots of Coloquintida, bark of roots of Capers, Worm-wood, long Birthwort, Endive-seed, of each alike, make a powder. The Dose is one dram, for children one scruple.

Another Theriac against the stings of Scorpions. Take round Birthwort, roots of Gentian, Bay-berries, roots of Capers, Coloquintida, Worm-wood, Swallow-wort, white Briony, each alike, make it up with Honey.

Another. Take Myrthe, Opoponax, Smallage, each one dram and half, white Briony, long Birthwort, Pellitory of Spain, each six drams, seeds of Rue, Gith, Trifoly, each three drams, Gum, Arabick, what may suffice, with Vinegar make Trochis. The Dose is one dram to one dram and half. Another. Take Cloves of Garlick cleansed five drams, Nuts ten drams, Asa one dram, incorporate them well. The Dose is two drams. Another. Take Gentian, Birthwort, Myrthe, bitter Costus, Rue, Castoreum, wilde Mints dried, Pellitory of Spain, Pepper, Gith-seed, Asa fetida, each alike, make them up with Honey, The Dose is one aureus with wine. Also the powder of Eringo root is good with hot water, and the powder of Dodder. Also one aureus of Napellus with water. Ivy and Polium with water are very profitable. If a fever come upon it, open a vein. Asses drie dung drank with wine is very helpfull. Thus much from Rhafis.

External remedies from Albucasis.

Anoynt the place with Oyl of Ben. for many dayes, or Oyl of Jasmin, grinde Euphorbium with it, and Castoreum, or else Castoreum and Garlick ground together, with old Oyl for a plaister.

A Frog cut and laid on is very good. Take old Oyl one pound, Wax four ounces, Euphorbium one ounce, melt it in the Oyl, and anoynt the place with it.

Internals from Albucasis.

Let him drink hot milk from the Cow with wine or Honey. Cinquefoil-seed, and lees of wine, are Theriac in this disease, as also Rocket-seed.

Hiera Anacardina against the stings of Scorpions. Take Pellitory of Spain, Gith-seed, bitter Costus, black Pepper, Acorns, of each ten ounces, leaves of Rue, Asa fetida, roots of Gentian, long Birthwort, Bay-berries, Castoreum, Cassia lignea, Mustard, Melanacardium, of each five drams, make up the powders with Oyl of Nuts, and with juice of Radish-root make it compleat. The Dose is one dram daily, it causeth sweat. The brains of a hen in drink is very usefull.

Haly Abbas brings nothing that is new, but only takes other mens prescriptions. Concerning some Seals (amongst the hundred sayings of Ptolemy) and some fashions for Charms, both he and Kiranides make mention, but a Christian beleeves it not, nor are they worthy to be recorded by him.

Joannitius mightily commends a Plaister with Garlick and Butter, or to anoynt the place with Oyl of Peter, or pure juice of Leeks.

He prescribes to give inwardly of the pith of the greater Spurge four scruples, with warm water.

Rabby Moses prescribes one Sextula of Frankincense with Wine sufficient. Also he exhibits Pigeons dung dried, and finely powdered with Butter and Honey. The Dose is two Sextulas.

Guil. de Placentia bids men give drie or green Marjoram inwardly, to drink it with mans Urine, and to apply it outwardly.

Constantinus 4. Pantechn. lib. commends Hens dung, or the heart applied outwardly, and Pimpernel inwardly, taken with Wine, and powder of Gentian, Cinamon, Centaury.

Averrhois extolls Bezar stone above all, the Dose is the fourth part of an aureus.

Aristoteles mei θαυμασιον ανσινδρον, describes a kinde of Locust that is an Antidote against the Scorpion, which eaten presently cures the stings of Scorpions.

Serapio affirms the root of the male Coloquintida bruised and laid to the wound, that it will take away the pain. He commends inwardly Wormwood, Lettice-seed with Garlick, Mummy two grains, with the decoction of Sampire, and leaves of Laserwort.

Oribasius approves of the Lilly roots, and leaves, bruised and applyed, as also a Plaister of Vervain, and it is thus made. Take Vervain three ounces, Rosin six ounces, Wax, Pitch, of each two ounces and half, Oyl half an ounce, make a Plaister.

Inwardly he commends the ashes of River-crabs with Goats milk, or juice of Agrimony two ounces, with a draught of Wine, or the root of Dragons bruised, with wine.

Actius commends water Calamints and Nip, which some think to be so called because it is an Antidote against *Nepas*, that is Scorpions. He saith, Garden-snails bruised and laid on draws forth the venome; he commends also upright and green Vervain, if it be laid on for a Cataplasm. Also Sheeps dung laid on with Wine. He makes also this Plaister. Take wilde Rue bruised with Vinegar one dram, Wax one dram, Pine Rosin three ounces, make a Plaister, it is admirable against the stings of Scorpions.

Inwardly, he writes that Garden Parsnips cure beyond expectation, be it eaten green or dried, and drank with Wine. Take Castoreum, Lazerwort, Pepper, of each four drams, bitter Costus, Spikenard, Saffron, juice of Centaury the lesse, of each two drams, clarified Honey what may suffice, mingle them. The Dose is the quantity of a Hazel-nut with Wine and water; it drives the Scorpions venome from any part, as *Actius* proved on himself. *Egineta* gives quick Brimstone bruised with a River-crab to drink in Wine.

Nonus bids lay on Licharge or Silver presently upon the place stung, and he commends Brimstone, if it be taken the quantity of an *Egyptian* bean with eight grains of Pepper in Wine.

Anatolius commends this, to sprinkle Crows dung upon the stinging of the Scorpion.

Silvaticus out of *Haly*, commends a Want, or the greater house Mouse laid on, and out of *Serapio*, Pewter powdered and drank.

Orpheus commends Coral in drink, and the stone called *Scorpiodes* laid on with a Garlik-head.

Octavius, *Aretius*, *Horatius*, *Zoroastres*, *Florentinus*, *Apuleius*, *Democritus*, and other Authors of the *Geoponica*, adde but a few things to the Medicaments of the Antients, besides some old wives fables, and enchanted prints that are hatefull to God and man. *Pliny* tells such a fiction, but no man can tell with what reason or credit: If, saith he, one that is stung with a Scorpion get up upon an Asse, with his face toward his tail, he shall do well, but the Asse will suffer.

Myrepsus extolls the herb Flower-de-luce, well bruised, and then drank with Wine or Vinegar.

Quintus Serenus writes thus, and adviseth,

*These are small things, but yet their wounds are
And in pure bodies lurking do most harm, (great,
For when our senses inward do retreat,
And men are fast asleep, they need some charm,
The Spider and the cruel Scorpion
Are wont to sting, witnesse great Orion,*

*Slayn by a Scorpion, for poysons small
Have mighty force, and therefore presently
Lay on a Scorpion bruised, to recall
The venome, or Sea-water to apply
Is held full good, such vertue is in brine,
And 'tis approv'd to drink your fill of Wine.*

Pliny amongst outward means addeth these: Mustard-seed bruised, Pimpernel, roots of Chamaeleon, Sea-weeds, wilde Onions, Hares rennet, Tortoyse-gall, ashes of Hens dung, Colts-foot, and Mullen-leaves: It is exceeding good to purge the body within, very well, with the seed of wilde Cucumber, and *Elaterium*, and then to drink the juice of Lettice, and to drink the dried leaves and stalks in Vinegar.

Ammi drank with Linseed.

Wilde Cumin.

The third kinde of Canila.

Fennel-seed.

Root of Cyprus.

Great Saffron.

Cresses.

Yellow Camomil.

The tender stalks of green Figs.

Bay-berries.

In Wine.

The seed of Hyacinth with Southernwood.

Seeds of Trifoly, and Rocker.

Four oboli of Agarick.

The juice of Jelly-flowrs and Plantain.

The Ashes of River Frogs.

Chamaipythe.

The herb *Nodia*.

Seed of white Thorn.

Flame-coloured Campions.

Arnoldus Villanovanus hath these: Herb *Trinity* cures the wounds of Scorpions, and kills the Scorpions themselves. Let the sick drink one spoonfull of the juice of the root of Dwarf-elder with Wine, and it is an infallible remedy. Take of the roots of Cappars, Coloquintida, Worm-wood, long Aristolochia, Gentian, Bay-berries, Yellow Ben. White Briony, of each alike, make it up with Honey. The Dose is the quantity of a Nut with Wine. *Another*. Take seeds of wilde Rue, Cumin, Garlick, Hazel-nuts, of each one dram, leaves of dryed Rue one grain and half, Myrrhe, Frankincense, each one grain, white Pepper, Opium, each three drams, Opoponax, Galbanum, of each half a dram, make it up with Honey. The Dose is the magnitude of a Bean with Wine. *John Arden* an *English* man; (he was in his time the most skilfull Chirurgion in *England*) after his long practise in *England* and *France*, he affirms he could finde nothing more safe against the sting of the Scorpion, then to draw forth two or three drops of blood hard by the

X x x x

the wound, and presently to anoint the wound with the same blood. *Celsus* saith that those Physicians did some such thing, who were wont to keep the blood they drew forth of the arms of those that were stung. *And this shall suffice for remedies against the stings of Scorpions.*

If any man chance to be bit by *Rhasis* Scorpion, (which we called Bunch't-back) the first day a small pain is perceived, but the second, straightness, heaviness, and sadness is seized on the sick; the colour of the body is divers almost every hour, and changing from green, yellow, white, and red; whence it may appear, that all the humours are infected, the place burns by the confluence of pain, and humour, swooning followes, and trembling of the heart, an acute Fever, and swelling of the tongue, by reason of humours melted and corrupting in the brain, and falling down on the roots and muscles of the tongue: sometimes also the urine is bloody, by reason of the acrimony of the venomous matter, and green choler is cast forth by vomit, also the guts are tormented with a sharp and vehement pain. Almost all symptoms fall upon the nerves that can happen to them. *Rhasis bids cure all these things this way:* First, incision being made on the place, and cupping glasses applyed, burn it with a strong actual cautery, then anoint the wound with the juice of wilde Endive, or with oyl of Roses, Barley water, Juice of Apples, and with all cold things. If the belly be not soluble, make it so with a gentle Clyster, and the juice of Blites, Nitre, and oyl of Violets, and let the patient take this Theriack. Take Opopanax, Myrrhe, Galbanum, Castoreum, white Pepper, of each alike, make it up with liquid Storax and Honey. The Dose is the quantity of a Jujube: the part must be fumed with a piece of a millstone heat, and sprinkled with Vinegar. Also foment it with water of wilde Lettice. The usual Theriack. Take the rind of the root of Capparis, root of Coloquintida, Wormwood, round Birthwort, Hepatica, wilde Dandelion, dried, each alike: make a Powder: the Dose is two drams; also sowre Apples must be eaten. *For pain in the belly:* Let him drink oyl of Roses, with Barley water, Citrals, Gourds, also give sowre Milk. *For trembling of the heart:* Let him take juice of Endive, or syrup of Vinegar, or syrup of Apples, with troches of Camphire, or sowre Milk the same way. *If the wound be afflicted with great pain:* Lay on a Cataplasme of Bole and Vinegar: for a defenative and for a sharp remedy, lay on Euphorbium, or Castoreum, Poly root drank with water, and a Rans flesh burnt, is profitable. *Theriack called Hascarina, first invented in the Province of Hascarium.* Take leaves of red Roses iv. drams, Spodium ij. drams, Citron Sanders ij. drams and half, Saffron j. dram, Licorice ij. drams, seeds of Citrals, Melons, Cucumers, Gourds, Gum tragant, Spike, each j. dram, Lignum Aloes, Cardamon, Amylum, Camphir, each j. dram, most white Sugar, Manna, each iij. drams, with the mucilage of Fleawort and Rose-water, what may suffice, make it up. The people of *Hascarium* was wont to draw blood from the sick (saith holy *Abbas*) almost till they fainted: then they gave sweet milk to drink, and water distilled from sowre Apples. Also they gave sowre Milk in great quantity. Thus the *Arabians* speak of this pestilent kinde of Scorpions that *Nicander* and all the Greeks were ignorant of, and that was too common in the Countrey of *Hascarium*. Now we will speak of Spiders.

CHAP. XI.

Of the Name of Spiders, and their Differences.

The Name.

THE Latine name *Araneus*, or *Aranea*, is in Greek, ἀράχνη, from the slender feet it hath, or from its high gate, from the cobwebs it spins: Others call him μύροχάλην, or *Muscatricem*; *Kiramides*, κίραμιδες; *Hesychius*, σίδην; the Hebrews, *Acabitha*, *Achar*, *Acabish*, *Semamith*; in Arabick, *Sibth*, and *Phibit*, *Aldebabi*, and *Aldebani*, as it is called by *Bellunensis*: the Germans call it *Spinn*, and *Banker*; the English, *Attercop*, *Spider*, *Spinner*; the Brabant, *Spini*, and French, *Araigne*; Italian, *Ragno*, *Ragna*; the Spanish, *Arana*, or *Taranna*; the Slavonians, *Spanauk*; the Polonians, *Paiack*; the Barbarians, *Koatan*, *Kersenati*; *Isidore*, l. 12. c. 12. saith it is called *Aranea*, because it is bred and nourished by the air: a twofold error: for if they live by the air, wherefore are they so careful to weave nets, and catch Flies? and if they were bred of the air, wherefore do they copulate? wherefore do they thrust forth little worms and eggs? but we will pardon the elegant Etymologer, because who makes a custome to play thus with words. There are many of these kindes, and all of them have three joynts in their legs:

*A little head and body small,
With slender feet, and very tall;
Belly great, and from thence come all
The webs it spins.*

The differences.

Now Spiders are venomous, or harmless; of harmless some are tame or house-spiders, those are the biggest of all; others live in the open air, and from their greediness are called hunters or wolves: the smaller kindes of these do not weave; but the greater sort begins his web very sharp and small by the hedges, or upon the ground, having a little hole to creep into, and laying the beginnings of his webs within, observing whilest something shakes the web, then he runs to catch

catch it. The venomous Spiders called Phalangia, are so venomous, that the place they wound will presently swell. These are of two kinds; for some are less, some greater; the less are various, violent, sharp, falacious, and going as it were rebounding, which as we read, are called *Lumax*, or *Fleas*, or *Apes*; others are called *Oribates*, which are found especially on trees in mountains; they are called *Hypodromis*, because they live under leaves. *Gesnerus*. It is a hairy creature, and breeds in the greater trees. The belly of it is moderately with incisions, that the cutting may seem to be marked by thred. *Ælianus*.

CHAP. XII.

Of Spiders that are hurtful, or Phalangia.

IN Italy they know not the *Phalangium*, (said *Pliny*) It is of sundry kinds; one is great like *The difference* to a Pismire, but much greater, with a red head; the other part of his body is black, with of Phalangia white spots running between. The Pismire kinde of *Actius* hath a smoky body, an ash-coloured and descripti- neck, and the back as it were adorned with stars. *Nicander* his ἀργεον; *Actius* calls αὐχον; the on. Latines call it *Venator*; it makes a weak wound and without pain, but yet a little venomous: it is found amongst the Spiders webs, where (like hunters) it catcheth Flies, Bees, Horse-flies, Oxe-flies, and Wasps also, and (unless you will not credit *Lonicerus*.) Hornets too, and it spoils all that the nets can take and hold: that this is the same with *Aristotles Pulex* no reasonable man will deny. It hath a broad round volubilous body, the parts about the neck have an inci-

sion; and there are bred three eminences about the mouth. There is another Phalangium which *Nicander* calls βῆξ; *Actius* βῆξον; *Ælian*, βῆξ; (from the likeness of it to the stone of a black Grape) it is round, and black, and shining, and globe-like, the feet are extreme short, as if they were imperfect, but it moves swiftly: it hath a mouth, but with teeth bred under the belly, and it moves with all the feet at once. Whether *Aristotles* Spider will bite, let the Reader judge. Truly it is not much unlike it, as *Grevinus* rightly conjectured. In this description, *Actius*, *Ælianus*, *Plinius*, do almost agree with *Nicander*. *Ælian* put long feet amiss for small feet, and affirmed it to be only an African creature. *Asclepius*, were the same, unless it were distinguished by certain white stars and lines, that are fat and transparent. Only *Pliny* after *Nicander* made mention of this, as if it had been unknown to *Aristotle*, *Galen*, *Actius*, *Ælian*, *Avicenna*. The blewish coloured Spider is worse than all these, called by *Nicander* μέδνηξ; going on both sides with very long and tall feet: the Scholiast adds δαυδ, that is downy and high, not high downy, as *Lonicerus* translates it. *Pliny* saith hairy with black down, though I can hardly be induced to believe that the blewish Phalangium is hairy with black down. *Nicander* calls that Phalangium δὲ δναι, which others call σφονδύριον, differing only from the red Hornet by want of wings, and is wonderful red. It is held far worse than the blew, though that by only touching doth communicate her venom, and break a crystal looking-glass (saith *Scaliger*) by running over it. There are two kinds of *Tetragnathi*, the worst is with a white line running along the middle of the head, and another across that. The milder or ash-coloured, white on the latter part, is of the same colour, and that makes very broad nets for flies on the walls. *Plin.* and *Hermolaus*. But as *Actius* saith, *Tetragnathus* is one kinde of Phalangium, with a broad body, whitish, with rough feet, it hath two little risings in the head, one upright, the other broad, that it seems to have two mouths, and four cheeks. *Ælian* saith there is a great number of them about the River *Arrhata* in *India*, sometimes deadly to the Inhabitants. In harvest time they are found amongst pulse, (when they are gathered with the hands) some small Phalangia are like to Beetles,

ties, of a flame-red colour; such are those the English call *Twings*, by eating whereof cattel are oft-times killed: Phalangium breeds amongst rees, and in the Peach-tree, they call it *βεγγοναδένις*, by *Nicander* and *Aetius*; κεφαλονέσις, by *Dioscorides*, because it boldly strikes the heads of those that pass by it, when it descends by a thred, or falls down without it. It is a little creature in the shape of a Butterfly Phalana: it goes horridly with the head alwaies nodding, and a heavy belly, it is of a long body and a greenish colour; it hath its sting in the top of its neck, if it light upon any man, it will especially wounds the parts about the head, as *Aetius* witnesseth; it is nourished in the Peach-tree leaves, and hath wings like to some Butterflies: whence the Scholiast would insinuate that this kinde of Phalangium is winged, which no man hath observed yet. *Ponzettus* and *Ardoynus*, deceived by *Rabbi Moses*, suppose it to be *Cranocleptes*, and the Tarantula; *Gilbert* an English man followed this error, in the Chapter of the Tarantula. *Sclerocephalus*, or hard-head, little differs in fashion from the former; it hath a head as hard as a stone, and all the lineaments of its body like those little creatures that fly about candles. *Scoleton* is a long Spider, and varied about the head especially with some spots. There is also a kinde of Phalangium, *Pliny* calls it the downy Spider, with a very great head; which being cut, they say that two worms are found, which bound to women before conception in a crows skin, will keep them from conceiving: and this verue of them will continue for a year, as *Cecilus* hath left it written in his Commentaries. We call the last *Appulus*, and commonly *Tarantulas*, famous by that name, from the Countrey of *Tarentum*, where they are most frequent, it borrows its name, we give you here the picture of it, that was bestowed upon *Pennius* by an Italian Merchant of happy memory; where if you paint the white places with a light brown, and the black with a dark brown, you have the true spotted Tarantula; I know no man yet that described it as it should be. *Ferdinandus Ponzettus* doth saign it to be only with six feet, and *Ardoynus* thinks the same, and saith more, that it hath a long tail. *Rhasis* calls it *Tarantula*, *Sytra*, *Albucasis*, *Alsari*, *Rabbi Moses*, *Aggonfarpa*, *Avicenna*, *Sebigi*, *Gilbert* an English man, *Taranta*; for he followed *Ardoynus*, who made two kindes of Tarantula's, one brownish, as we have pictured it: another Saffron coloured and clear, such as *Egypt* produceth.

Phalangium is not known in *Italy*, as we said out of *Pliny*, but now they are all almost found in the south Countrey, with great inconvenience to mowers, and hunters, as is manifest by daily experience. *Ponsertus* was wonderfully deceived, who in l. 3. c. 15. of the Scorpion, calls Phalangium a venomous Fly. It is a cruel creature (saith *Alexander ab Alexandro*) pestilent to touch. In summer when the sun is very hot, their sting is venomous, at other times not. In the coldest Countreys there are many Spiders, but no Spiders called Phalangia, or if there be any, they are free from all venome and infection. Tarantulae lie hid in the chinks of furrowes that are cleft with heat, and they strike and wound with their teeth mowers or hunters that are not aware of them; wherefore the inhabitants defend their hands and feet, when they go to mow, or to hawk or hunt, she makes her web like a net very silently, and all the little creatures she can catch, she provides for her supper. All the Phalangia bring forth in their net, (that they make thick) and they do as it were sit upon eggs in a great number, and when the young grows up, it embraceth the dam and kills her, and oft-times casts out the sire, if it can lay hold of him, for he helps the dam to sit, and they bring forth 300. *Belonius* l. sing. obs. c. 68. observed little Phalangia in sandy grounds creeping up the Horses legs, (may be that is it the Germans call *Stein spinnen*) by whose continual bitings they suddenly fainted, and staggering continually they consumed. *Basilius* saith that there are ten kindes of Phalangia, but he describes them not. *Avicenna* (I know not out of what Book of *Galen*) divides the Spiders Phalangia into the Egyptian, the black, the bright red, that men call *Raches*, the white, Citron coloured, Grape coloured, Pismire-like, like *Cantharis*, Waspy, and mountainous. But both he, and all the Arabians describe them so foolishly (to say no more) that there can be nothing more confused in so great a matter. Lastly, to add all the kindes of Phalangia which we have seen or read of. I shall annex the *Cretian Phalangium*, you have here the picture of it exactly printed. It is of colour brown and ash-coloured, a smooth body, and hairy legs: near the mouth it is fenced as it were with two hooked prickles, with which it bites and wounds. It lives as the Spiders do by Flies & Butterflies, & makes nets to catch them: she laies eggs, and fosters them under her breast, whence the young ones are thrust forth, which stick under the dams belly, till growing elder they kill her. They dig a hole fit for the bigness of their body; for as they are not every where of one colour, so they are not of the same magnitude. They dwell in a cave two foot deep, and on the outside they cover it with straw that the dust get not in. All these venomous Spiders are naturally so, for they suck not their poyson from herbs, (as some think from their

their likeness) for they do not so much as taste of them, nor yet from the malignity of their food. For they feed principally on Flies, Gnats, Bees, and they suck no ill humours from them.

Grievous symptoms follow the bitings of Pismire Phalangium, for there follows a mighty swelling on the part bitten, the knees grow weak, the heart trembles, the forces fail, and oftentimes death succeeds. *Nicander* saith that the sick sleep so deeply, that they are alwaies asleep at last, and are in the same condition as those are that are stung by the Viper: Histories relate that *Cleopatra* set one to her breast, that she might escape *Augustus*, without pain, nor is the wound deadly unless it be wholly neglected. *Rhagium* makes a very small wound, and that cannot be seen, after it hath bitten: the lower parts of the eyes, as also of the cheeks wax red, then horror and fainting seize on the loyns, and weakness on the knees, the whole body is very cold & hath no heat, and the nerves suffer convulsion from the malignity of the venome. The parts serving for generation are so debilitated, that they can hardly retain their seed, they make water like to Spiders webs, and they feel pain as those do are stung with a Scorpion. From the sting of *Asterion*, men seem wholly without strength, their knees fail them, shivering and sleep invade the patient. The blew Spider is worst of all, causing darkness and vomitings like Spiders webs, then fainting, weakness of the knees, Coma, and death. *Dysderi*, or Wasp-like Phalangium, causeth the same symptoms with the blew, but milder, and with a slow venome brings on putrefaction. Where the *Tetragraphii* bite, the place is whitish, and there is a vehement and continual pain in it, the part it self growes small as far as the joynts. Lastly, the whole body findes no profit by its nourishment; and after health recovered, men are troubled with immoderate watchings. *Aetius*: *Nicander* denies directly that the ash-coloured *Tetragnathon* can poyson one by biting him. The *Cantharis* like, or pulse Phalangium raiseth wheals, which the Greeks call *φουκλαίνας*, the minde is troubled, the eyes are wrested aside, the tongue stammers and fails, speaking things improperly, the heart is as it were moved with fury, and flies up and down. The *Vetch kinde* produceth the same mischiefs, and cause Horses that devour them, and cattel to be very thirfty, and to burst in the middle. *Cranocalaptes*, saith *Pliny*, if it bite any one, death followes shortly after. But *Aetius* and *Nicander* affirm the contrary, and that the wound thereof is cured without any trouble almost at all. Head-ache, cold, vertigo, restlessness, tossings, and pricking pains of the belly follow, but they are all asswaged (saith *Nicander*) by fit remedies. *Sclerocephalus*, is like to this in form, and forces and effects the same things, as also the *Scolecium*. We said that the downy Phalangium drives away barrenness, if it be carried about one, but whether it be violently venomous, I know no man that hath determined it. The spotted or Phalangium of *Apulias* doth produce divers and contrary symptoms according to the complexion of him that is wounded, and his present disposition. For some laugh, some cry, some speak falteringly, others are wholly silent, this man sleeps, the other runs up and down alwaies waking; this man rejoiceth, is merry and moves up and down, that is sad, slothful, dull; some think themselves to be Kings, and command all; some are sad, and think they are in captivity, and fettered: lastly, as men drunk are not of one quality: so are these that are mad, some are fearful, silent, trembling; some are bold, clamorous, constant. This is common to them all, to delight in musical instruments, and to apply their mindes and bodies to dancing and leaping at the sound of them. Lastly, when by continuance of the disease and the vehemency of it, they seem next unto death, yet when they hear musick they recollect their spirits, and they dance with greater chearfulness every day. These dancings being continued night and day, at length the spirits being agitated, and the venome driven forth by insensible transpiration they grow well. But if the Musicians upon any cause do but leave off playing, before the fuel of this mischief be spent, the sick fall into the same disease that they were first oppressed with. We must admire this most, above other things, that all those that are stung with the *Tarantula*, dance so well, as if they were taught to dance, and sing as well as if they were musically bred. (In *Italy* it was first invented, and custome hath taken it up to call such as are bitten, *Tarantati*, or *Tarantulati*.) *Cardanus* against faith and experience, denieth that musick can restore any that are bitten; yet we heard the same thing fell out at *Basil*, from *Felix*, *Platerus*, *Theodore*, *Zuingerus*, our most famous, and dear Masters, and we read the same in *Matthiolus*, *Bellunensis*, *Ponzettus*, and *Paracelsus*. And if the sweet musick of pipes could help mad horses, and pains of the hips, (as *Asclepiades* writes) why may it not help those are stung with a *Tarantula*? Somewhere are that assign to this disease, some I know not what small deity, as superintendent over it: they call him *St. Vitus* that had formerly great skill in singing, he being called upon and pacified with musick, as he is the parron of musick cures them, so that men superstitiously impute that to him, which they should do to musick and dancing. *Bellonius* reports that the *Cretian* Phalangium induceth the like mischiefs, and the pain and wound of it is also cured by musick. It is no wonder the Ancients described not these two kinds of Phalangia, because they knew them not, nor did they shew the waies how to cure their stings. *Dioscorides* writes thus of the common bitings of the Phalangia. The symptoms that follow their bitings are commonly these: The place stung looketh red, but neither swells, nor waxeth hot, but it is something moist; when it growes cold, the whole body quakes, the hams and groins are stretched out, there is a collection made in the loins, they are often urged to make water, and they sweat with very great pain, and labour to go to the stool, and cold sweat runs down every where, and tears trickle down from their darkned

This is the
sense of *Galen*,
but not the
same words.

darkned eyes. *Actius* adds further: They are kept waking, they have frequent erection of the yard, their head pricks, sometimes their eyes and their legs grow hollow. Their belly is unequally stretched out with winds, and their whole body swells, chiefly their face, their gums, their tongues, and tonsils, they bring forth their words foolishly and gaping, sometimes they are troubled with difficulty to make water, they are pained in their secrets, they make urine like water and full of cobwebs. The part affected is pricked and swells, (which *Dioscorides* denied before) and it is moderately red. So saith *Actius*, from whom *Paulus*, *Actuarius*, *Ardoynus*, differ but little. *Gal.* 3. de loc. affec. c. 7. hath it thus. The bitings saith he of the Phalangia are scarce to be seen: it first affects only the skin, and from the superficies of it, it is carried by the continuity of the fibres to the brain, and into the whole body: for the skin comes from the membranes, and they from the nerves and the brain; this is clear, because by presently binding of it on the farther parts, they are preserved from the venome that is near to them. In *Zacinthus* they that are bit by the Phalangia are otherwise affected, and more grievously, in other parts: their body is astonished, weakened, trembles, and is very cold: vomiting and convulsion followes, and inflation of the yard: their ears are afflicted with most cruel pains, and the soles of their feet. They use bathing for a remedy; if the party recovered go willingly into bathes afterwards, or were by chance or by craft brought into them, by the hot water the contagion passeth over the whole body, and he perceives the same mischief in the whole body. *Dioscorides* writes the same things in the chapter concerning Trifoly that smells like Asphaltum. The decoction of the whole plant easeth all the pain by fomentation, where Serpents have stung men, what man soever that hath ulcers and washeth himself in the same bath, is so affected, as he that was bit by a Serpent; *Galen* saith he thinks it is done by a miracle, *Lib. de Theriaca ad Pisonem*, if *Galen* did write that Book. But *Alian* speaks more miraculously, where he affirms that may happen to those that are sound, making no mention of ulcers. And thus much for symptoms. Now for the cure.

The cure,

The cure is particular or general. Physicians speak of but a few particular cures, because the general is commonly effectual.

But *Pliny* sets down a remedy against the biting of the Phalangium called *Formicarium*, that hath a red head: to shew another of the same kinde to him that is wounded, and they are kept dead for this purpose. Also a young Weasel is very good, whose belly is stuf with Coriander, kept long and drank in Wine. A Wasp, that is called *Ichneumon*, bruised and applied, drives back the venome of the *Phalangium Vesparium*, (saith *Bellonius*) not otherwise than as one living kills another, that is alive. For *Ichneumon* (saith *Aristotle*, is a small creature that is an enemy to the Phalangia; it often goes into their holes, and goes forth again, losing its labour. For it is a matter of great labour for so small a creature to draw forth its enemy greater than it self by force; but if he light upon his enemy preying abroad, he drags the Phalangium as easily with him as a Pismire doth a corn; and the more stiffly he drawes himself back, the Wasp draws him on the more fiercely, and sparing no pains, doth bestir himself with all his might; sometimes when he is tired with too much labour, he flies away and breathes himself, and having recovered breath, he goes to seek for the Phalangium again, and striking him often with his sting, at last he kills him; when he hath killed him, he carries him into his own habitation on high, and there it renews its kinde by sitting upon them. Those whom the Tarantula strikes, are helped by violent and constant motion, but *Celsus* on the other side commands those that are stricken by the other kindes of Phalangia, to be quiet and to move but little. But musick and singing are the true Antidote of it. *Christophorus de honestis*, bids presently exhibit *Theriaca Andromachi*. Also he gives Butter and Honey, and Saffron root with Wine. The Bezar of it are the green grains of the Mastick tree. *Ponzettus lib. de venen.* perswades to give ten grains of Mastick with Milk, or juice of the leaves of Mulberries, j. ounce and half. In the augmentation he cureth it with Agarick of white Briony, after sweating much they must be refreshed with cold and moist things, as with Poppy-water. *Mernula* saith they are cured with singing, dancing, leaping, and colours; I will not contend for the first three, but I cannot see how they can be cured with colours, especially when as they that are stung are blinde, or see very little. He saith also that inhabitants and citizens are hurt by them, but strangers are safe and out of danger, which no man of a smal belief, or not very great faith can believe. *Dioscorides* appoints a general cure: First, scarifying must be repeated, and cupping glasses set on with a great fire. *Absyrus* counsels to fume the part stricken, with the shels of Hens eggs first steeped in Vinegar, and burned with Harts-horn, or Galbanum.

Then you must use scarification, and draw fourth the blood by sucking or cupping glasses. Or, which is safest, burn the place affected with an actual Cautey, unless it were full of nerves; for then it is best to set a Cautey on the neighbouring parts. Then sweat must be provoked with clothes laid on, or rather by gentle and long walking. Lastly, to perfect the cure, you must prove by external and internal Medicaments, such as we here set down, and the most commendable and most noted we mark with an Asterisk. Internal remedies out of *Dioscorides*: Take seeds of Southernwood, Anniseed, Cummin seed, Dill, round Birthwort, wilde Cicers, Cedar fruit, Plantain, Trifoly, seed of Minianthes, each alike, bruise them severally; the Dose of them severally is ij. drams in Wine, but if you joyn many of them together, drink ij. drams or iv. with Wine: also j. dram of the fruit of Tamarisk is effectual, with Wine. Chamepithy, and the decoction

decoction of green Cyprus nuts with Wine. * Some prove of the juice of River-crabs with Asses milk and Smallage-seed, and they promise it shall presently take away all pains. Also a Ly of the Fig-tree is drank against the bitings of the *Phalangia*: also it is good to drinke the fruit of the Turpentine tree, Bay-berries, Balm-leaves, the seeds of all the wilde Carrots, and of Coriander, the juice of Myrtle-berries, Ivy, Mulberry, Cabbage and Cliver-leaves, with Wine or Vinegar, one dram of the leaves of Bean Trifoly drank with Wine.

Decoction of Sparagus root, juice of Houfleeke, juice of Clivers with Wine. He also commends a Snail bruised raw, and drank with Asses milk. * Also Balm-leaves with Nitre, and Mallows boyled with the roots, drank often. The leaves, flowers, and seeds of the herb *Phalangium*, and the seed of Gith, the Decoction of Asparagus, Mock Chervil, and the juice of Mullberries.

Out of Galen.

Take Birthwort, Opium, of each four aurei, roots of Pellitory of Spain three aurei, make Trochis as big as a Bean; the Dose is two Trochis with three ounces of pure Wine. The ashes of a Rams hoof drank with Wine and Honey. The remedies of *Diophrantis*, against the bitings of the *Phalangia*. Take Birthwort four drams, Pellitory as much, Pepper two drams, Opium one dram, make little Cakes as big as Beans, take two, with two Cyathi of the best Wine.

Another that is better. Take seeds of wilde Rue, Rocket-seed, Pellitory, Storax, quick Brimstone, each six drams, Castoreum two drams, mingle them, make Trochis as before with Snails blood; the Dose is three oboli in Wine. *Another.* Take Myrrhe, Castoreum, Storax, each one dram, Opium two drams, Galbanum three drams, Anniseed, and Smallage of each one acetabulum, Pepper thirty grains, make it up with Wine. *Another.* Take Myrrhe five drams, Spike of Syria six drams, flowers of the round Cane two drams and half, Cassia four drams, Cinnamon three drams, white Pepper one dram and half, Frankincense one dram and one obolus, Costus one dram, make it up with *Athenian* Honey; the Dose is the quantity of a Hazel-nut with water, or with Honey and water. *Apollodorus* * remedies. Take wilde Cumin one acetabulum, blood of a Sea-tortoise four drams, rennet of a Hinde or Hare three drams, Kids blood four drams, make them up with the best Wine, and lay them up; the Dose is the quantity of an Olive, in half a Cyathus of Wine. *Another.* Take seed of bituminous Trifoly, round Birthwort, seeds of wilde Rue, Tare-seed dried in the Sun, each six drams, drink them in Wine, and make Cakes, four drams weight; the Dose is one Cake, *Gal. 2. de Antid.* where he hath collected many remedies from Authors.

Out of Aetius and Aegineta.

Take quick Brimstone, Galbanum, each four drams, bitter Almonds blancht, juice of Laserwort two drams, of Asa four drams, mingle them with Wine and Honey, and drink them, also lay them on thus. *Another.* Take Ameos two drams, Flower-de-luce one dram, or of St Johns wort, or bituminous Trifoly, drink them in Wine. Or take Anniseed, wilde Carriot-seed, Cumin-seed, Gith, Pepper, Agarick, each one dram, drink it. Or take leaves of Cyprus-tree, or the Nuts bruised in Wine and Oyl one Hemina, and drink it.

For this end he prescribes Bay-berries, the herb Scorpions grasse, Serpenter, Laserwort, Calamint, Chamapitha, by themselves, or with Rue and Pepper. *Another.* A bunch of Mints boyled in fresh Posca, let the sick drink two Cyathi: Also Germander, Chamapithy, white Thorn, and Penitoyall in decoction are good. Also a Ly, and juice of Ivy with Vinegar. *Asclepiades used these.* Take seed of Sphondylium dried, Calamint, each alike, bruise them, and drink often in a day two Cyathi of Wine with them. *Another.* Take juice of Laserwort, Daucus-seed, dried Mints, Spikenard, each alike, make it up with Vinegar; the Dose is one dram: take it with Posca and Wine, four Cyathi, and presently go into a hot Bath; when Laserwort is wanting, take the double portion of pure Asa.

One that is better. * Take of Cenchryus, seeds of wilde Rue, Pepper, Myrrhe, wilde Vine, of each one dram and half, Cyprus root one dram, make a Confection; the Dose is one dram, with four Cyathi of Wine, and one Cyathus of Honey. Also the eating of Garlick is good, as also a Bath and Wine, and such things as help against Vipers stings. *Paulus* repeats the same remedies, and *Theban* Cumin, or seed of *Agnus Castus* or leaves of the white Poplar-tree drank in Beer are very effectual.

Out of Nicander. Rosin of the Turpentine tree, Pine or Pitch-tree, drank or swallowed, is exceeding good, which *Gesner* and *Bellonius* say they learned by experience, to be true.

Out of Avicenna. The Myrtle-tree and the fruit of it, *Doronicum*, Mastick, *Assafoetida*, Dodder and its root, the Indian Hazel-nut (which is *Theriac* for this disease) white Bdellium, all of these drank with Wine. Take roots of Birthwort, Flower-de-luce, Spike Celtica, Pellitory of Spain, Daucus, black Hellebore, Cumin, root of Daffodil, leaves of Winter Wheat, leaves of Dogs-tooth, Pomegranate tops, Hares Rennet, Cinnamon, juice of River-crabs, Storax, Opium, *Carpobalsamum*, of each one ounce, beat all to powder, and make Troches, the weight of one aureus, which is the Dose of them. Also give in Wine the decoction of the leaves of bituminous Trifoly, of the Cyprus Nut, Smallage-seed. Moreover give to drink, Pine kernels, *Ethiopian* Cumin, leaves and rinde of the Plane-tree, seeds of Siler Montanum, black wilde Chiches, seed of Nigella, Southern-wood, Dill, Birthwort, fruit of the Tamarisk, for all these are very good. Also the juice of wilde Lettice and Houfleeke are commended.

The

The decoction of Cyprus Nuts, especially with Cinamon and River-crabs juice, and juice of a Goose: Also the decoction of Sparagus with Wine and water.

Another. Take Birthwort, Cumin, each three drams with hot water: *An approved Theriac.* Take Nigella seed ten drams, Daucus, Cumin, each five drams, Cyprus roots and Nuts, each three drams, Spikenard, Bay-berries, round Birthwort, *Carpobalsamum*, Cinamon, Gentian, seeds of Siler Montanum, and of Smallage, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. *Confection of Assa.* Take *Assa fetida*, Myrthe, Rue-leaves, each alike, make it up with Honey; the Dose is one or two drams with Wine.

Out of Absyrus, Lullus, Albucasis, Rhafis, Ponzettus. Take white Pepper thirty grains, with a draught of old Wine, take it often. Also Thyme is given in Wine. *Abysrus.* Drink upon it one spoonfull of Wine distilled with Balm. *Lullus.* Take dry Rue, Costus, wilde Mints, Pellitory of Spain, Cardamum, each alike, *Assa fetida* one fourth part, Honey what may suffice, mingle all, and make it up; the Dose is the weight of an Hazel-nut in drink. *Albucasis.* A Hens brain drank with a little Pepper in sweet Wine or Posca. The decoction of Cyprus-nuts with Wine. *A Theriac against the bitings of Phalangia.* Take Tartar six drams, yellow Brimstone eight drams, Rue-seed three drams, Castoreum, Rocket-seed each two drams, with the blood of the Sea-tortoise, make an Opiate; the dose is one dram with Wine. *Another.* Take Pellitory of Spain, round Birthwort, each one part, white Pepper half a part, Horehound four parts, make it up with Honey; the Dose is one dram. *Another.* Roots of Capers, long Birthwort, Bay-berries, Gentian root, each alike, drink it with Wine. Or drink Diasia with strong Wine, and Cumin, and Agnus Castus seed. *Another.* Take Nigella seed ten drams, Daucus, Cumin, each five drams, wilde Rue-seed, Cyprus Nuts, each three drams, *Indian Spike*, Bay-berries, round Birthwort, *Carpobalsamum*, Cinamon, Gentian root, seed of bituminous Trifoly, Smallage-seed, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. *Rhafis.*

Out of Pliny, Celsus, Scaliger.

It is good for those that are bitten by the *Phalangium* to drink five Pismires, or one dram of the *Roman* Nigella seed, or black berries with Hypocistis and Honey. Also Marsh Smallage and wilde Rue, are peculiar against the bitings of the *Phalangia*: Also the blood of the Land Tortoise is good, juice of Origanum, the root of Polymonia, Vervain, Cinquefoil, the seed of Garden Onyons, all the kindes of Housleek, roots of Cyprus, Turnsole with three grains of juice of Ivy-root, in Wine or Posca; also Castoreum two drams, in Mulsum to cause vomit, or in juice of Rue to stop it. Also Agnus Castus seed two drams: *Apollodorus* that followed *Democrates*, calls a kinde of herb *Crocides*, by the touch whereof *Phalangia* die, and their force is abated; the Mat-rush-leaves next the root, eaten do profit. *Pliny.* Take wilde Vine-berries, Myrthe, each alike, drink them out of one Hemina of sod Wine. Also the seed of Radish, or root of Damel must be drank with Wine. *Celsus.* But amongst many other remedies that are proved, one Antidote is due to *Scaliger*, who was the ornament of our world and age; the form of it is this. Take true round Birthwort, Mithridate, each two ounces, *Terra Sigillata* half an ounce, Flies living in the flowers of *Napellus*, 22. Citron juice what may serve turn, mingle them. For saith he, against this venome or any other bitings of Serpents, Art hath scarce yet found out so effectually a remedy. *Scaliger.* Juice of Apples drank, or of Endive, are the Bezar against the bitings of the *Phalangium*: *Petrus de Abano.* These are the most approved outward remedies. Five Spiders putrefied in Oyl and laid on, Asles or Horse dung anoynted on with Vinegar or Posca: Take Vinegar three sextarii, Brimstone a sixth part, mingle them, foment the place with a sponge, or a bath, the pain being a little abated, wash the place with much sea-water: Some think that the stone Agates will cure all bitings of the *Phalangia*, and for that reason it is brought out of *India* and sold dear. *Pliny.* Fig-tree ashes with Salt and Wine, the root of the wilde Pannace bruised, Birthwort and Barley-meal impasted with Vinegar, water and Honey and Salt for a fomentation. Decoction of Balm, or the leaves of it made into a Pultis and applyed; we must constantly use hot Baths. *Pliny.* Open the veins of the tongue, and rub the places swolne with much Salt and Vinegar, then provoke sweate diligently and warily. *Vigerius.* The practically men mightily commend the root of Panax Chironia. *Theophrastus.* Anoynt the wound with Oyl, Garlick bruised, or Onyons, or Knot-grasse, or Barley-meal with Bay-leaves, and Wine, or Wine Lees, or wilde Rue, lay it on with Vinegar for a Cataplasme. *Nonus.* Take live Brimstone, Galbanum, each four Denarii, *Lybian* juice and Euphorbium, each alike, Hazel-nuts pild, each two drams, dissolve them in Wine, and with wine make a Cataplasme, also inwardly it helps much. Flies bruised and laid on the part affected. Also a Barbel heals the bites of a venomous Spider, if it be cut raw and applyed to it. *Galen.* Anoynt all the body with a moist liquid Oyntment with wax. Foment the part affected with Oyl, wherein bituminous Trifoly hath been soaked, or with a Sponge and hot Vinegar, very often. Make also a Cataplasme of these that follow, namely, with Onyons, bloodwort, *Solomons* seal, Leeks, Bran boyled in Vinegar, Barley-meal, and Bay-leaves, boyled in Honey and Wine. Make them also with Rue, Goats dung with Wine, Cyprus, Marjoram, and wilde Rue with Vinegar. *Asclepias his Plaster.* Take seed of wilde Rue, Rocket-seed, Staves-acre, of Cenchrus, Agnus Castus, of Apples, Nuts, of leaves of Cypress, each alike, bruise all with Vinegar, and with Honey make a Plaster. *Actius.* Lay the decoction of Lupines upon the place affected, the Eschar being first taken away, then anoynt

anoynt it with Goose grease, wilde Rue, and Oyl in the hot Sun or by the fire, or make a Cataplasme of Barley-pap, and broth of Lupines. *Oribasius*. An Indian Hazel-nut smeared on cures the bitings of the *Phalangia*: Oyl of Worm-wood, and the milk of Figs anoynted on, doth profit very much. *Avicenna*. Of hot ashes, Figs and Salt with Wine make a Plaiter: Also it is convenient to hide a great boll in sand or hot ashes, and by that means to sweat with Antidotes. *Rhazes*. Goats dung must be dissolved with the Pulstules, and laid to the part affected. *Kiraniides*. Lay on often cold Iron. *Petrus de Albano*. Foment the place with juice of Plantain daily. *Hildegard*. Oyl of artificiall Balsam is exceeding soveraign. *Euonymus*. A Fomentation of the branches and stalks of Masterwort must be continued, or let him drink Ver-vain with Wine, and lay it on outwardly, first bruised. *Turneser*. Bruise Rue with Garlick and Oyl and lay it on. *Celsus*. You shall lastly finde divers such remedies in *Pliny* and *Dioscorides*, so digested into order, that they rather require our silence, than our curious, and unusefull repetition. Of this therefore thus far.

Now let us see

That Spider with which our mindes well agree,

Who sits within the midst of's Net to watch

Where the East winde blowes, it shakes, he doth catch

Flies that but touch his Web, none can him match.

CHAP. XIII.

Of the tame or house Spider.

Amongst Insects, though many may be found (as *Pliny*, *Calius*, *Curio* the second, out of whom we have fetched many of these things, say rightly) that may exercise great wits, yet the nature of Spiders is worthy to be admired in chief, and is apparent by their curious working, as any reasonable man will judge. *Aristotle* the greatest diver into Nature, saith that this is the most magnificent, and wisest of all Insects. And *Solomon* himself at whose wisdom all the world admired, amongst those four Animals that exceed Philosophers for their knowledge, reckons up the Spider, dwelling as he saith in Kings Palaces, and weaving Webs that man cannot do the like. The Poets saign that the Spider was once a *Lydian* Mayd, that *Minerva* had taught to work with the needle, and weaving all curious artificiall work: But she was grown so proud of this skill, that she denyed that ever she learned this of *Pallas*, and she proceeded so farre in arrogancy, that she boldly challenged *Minerva* to work with her in all these Arts: Wherefore *Pallas* disdainig her pride, came, and sharply rebuking the Mayd for her insolence, brake all her fine wrought works with a Wand: At this the Mayd was sore abashed, and thought to have hanged her self; but the Goddess pitieing the poor Maids condition, would not suffer her to do so, but as she hung by a very fine Cord, she changed her shape into a Spider.

Pallas was angry, and in wrath she said,

Yet live and hang thou proud and haughty Mayd,

And that thou mayst still suffer 'tis my minde,

The same Law lasts for thee and for thy kinde.

But they that interpreted this a Fable or a History, say that *Arachne* found out the art of spinning, sowing, and weaving hemp, taking pattern by the Spiders. And this needs not seem strange to any man, since the Swallowes found out the Art of plaistering, and for Oculists, Eagles for building, *Hippotamus* for letting blood, *Ibis* for giving Glysters, Goats for Antidotes, so Tortoises, Weasels, Storks have instructed us.

To praise the Spider as I ought, I shall first set before you the riches of its body, then of its fortune, lastly of its minde. If you consider the matter of it, it is light, partaking much of Air and Fire (that are the most active and noblest Elements) but it hath little of earthly dregs and gravity. Consider the figure it is wholly round and orbicular, or at least Ovall, that is next unto it. The substance of it is thin, transparent, subtile, and though sometimes by the abundance of plunder and prey, it becomes so cram'd, that it growes as great as a Walnut, and (if *Cardan* erre not) as great as a Sparrow sometimes, yet if you see it hanging in its Web, against the light, it shines all through like a *Chrysolite*, and makes reflexion of beams most gratefull to the eye. It hath the same colour that *Ovid* writes that Lovers have, that is, pale; and when she sticks aloft with her feet cast every way, she exactly represents a painted Starre. As if Nature had appointed not only to make it round like the Heavens, but with rays like the Stars, as if they were alive. The skin of it is so soft, smooth, polished and neat, that she precedes the softest skind Mayds, and the daintiest and most beautifull Strumpets, and is so clear that you may almost see your face in her as in a Glasse; she hath fingers that the most gallant

The praise of

der taken
from the bod-
dy of it.

gallant Virgins desire to have theirs like to them, long, slender, round, of exact feeling, that there is no man, nor any Creature that can compare with her: she hath feet not numberlesse, as the Scolopendra, nor is she without feet, as some Insects are, nor hath only six feet, as those that want wings have, but eight feet, which number is next to the most perfect number, as all men know. These legs also are made in a sesquiterciall proportion, which is most admirable and venerable; so that though the latter feet be alwayes shorter then the former, yet they hold still their proportion. Many Philosophers who hold that Spiders are blinde, are blinde themselves, for were they blinde, how should they make choice of those places that are most convenient for to pitch their nets, and who should lead them to fasten one thred to another, and should know how to mend their Webs when they are broken by accident? when as also the tame and familiar Spiders will come from a distance to catch a Flie that toucheth but the sides of their threds, they are the more bold to pursue them, and will take them as it were from hand to hand, as we have often seen. Truly they are blinde at noon-day, and understand nothing, who say, that Spiders are blinde. In this Spider there is no poyson nor hurt, for if it bite it is without harm, and it is rather tickling then painfull. Also their very Carkases, and their bodies, their eyes, their excrements, are good and usefull for many diseases, as we shall make it plain enough when we speak of their use. I know not what it was that made *Pennius* so frighted when he thought of eating them; for he knew a Noble *English* Lady, and *Phaernus* a Physician, that did often eat them without any hurt at all. For the truth is, Spiders are free from poyson, and are very good for ones health. But because it seems so horrid a Creature to some people, that the very sight of it makes them fly from it, I rather attribute that to their melancholy apprehension, tendernesse and distemper, than to the ill form of the Spider. Nature hath used no lesse elegancy and bounty in the Spider, then she hath done in the Butter-fly, and Flie, and it is no light disease of the minde to disdain so beautifull a work, and to be afraid of a Creature that weaves so curiously. Lastly God hath given a wonderfull disposition and nature of the skin to so wonderfull a body; for it doth not only once a year (as Vipers do) but every Moneth if she be well fed she changeth her skin, and recovers a new one that is more curious. Also it is of so excellent a temper, and so frugall in its diet, that in a wholesome place, where

The praise of
the house Spi-
der from the
goods of For-
tune.

she can get any provision, she will live alwayes. I think that to be the chiefeft good amongst the goods of Fortune, or rather Fate, that they carry the matter of their Webs in their belly, and they are so well stored with it, that a Spider can draw forth innumerable threds and weave them, and catch if need be, a hundred Flies, and have Nets enow to wrap them in. And though they have not meat in a Granary as Pismires have, nor ready and growing up, as Bees have, but they live only upon food they light upon by chance, yet by Gods providence the prey comes flying by that sustains them, and oft times they grow fat with plentifull dishes that they take by hostility. Further, I should think it no small part of good Fortune given to the Spider, that when she is satisfied with the troublesome fare of the Court, yet she never hath the Gout. You have heard that *Solomon* of old assigned her a place in Kings Palaces, that she might be a pattern to his Courtiers, to labour, to be ingenuous, wise, frugall, and vertuous. There beginning her Webs she workt with hands and feet, and never need to goe a hawking for Flies, she feared no assaults, no treachery: and briefly, this most wise creature did bear rule in the great Palace of that great King. After him arose bad Princes, that were idle, followed ill counsell, that came to ruine, it is hard to say, how hardly they used the poor Spider, and commanded forthwith to sweep her down with beesoms and poles, as if she had been a night-robber, and to tread her under foot, and to kill her. Presently Furies ran and swept down and spoyled all those learmed works that had been wrought, so that she could hardly escape the quick-sighted beesoms of those lazy devils. She was most miserable now, left all alone in so great abundance, and in so large houses, she could not finde one corner to be in. And by the Kings example, the Nobles and rich men drove out this Mistresse of labour and vertue, and they would not suffer one thred to remain, that was a Token and Ensign of her great wisdom. She when once she went abroad to travell (as the Fabulist wittily saith) the Gout by chance came to keep her company, though she could hardly hold pace with her, but with great toil. When as now they had travelled one dayes journey, at night they took counsell to try their Host, but they were of different opinions. The Spider going into the City, got into the house of a rich Citizen, and so soon as she began to work and to spread her Tapestry and hangings, (by the example of the bad Kings) he forthwith hates her, and drives her out, and the same night he expos'd her to the rain and open air. But the Gout being lame, when he could go no further, got into the first house of the Town, and could scarce intreat to be harboured in the poorest Cottage there; and when she lay down, she found misery enough; she had for supper brown bread that her stomach rose against, and a little herbs, scarce any salt upon them, and water was fetcht from the next pond, in an earthen Pitcher to quench her thirst; being thus entertained, she required a bed to ly on, she could get none but straw or the planks to ly upon, and so she lay down in pitifull misery, lamenting and sighing: But alas how wretched a thing it is for tender limbs, and that cannot endure to be touched (as saith *Hippocrates*) to ly upon such a hard bed and pillowes. The next morning the Spider and the Gout met again; the Spider complained terribly of the incivility and rudennesse of the rich Citizen, and the Gout on the other side complained of her Hosts poverty and poor fare, shewing the

the black and blew marks the hard lodging had made in her skin; and when they had a while taken deliberation about it, they both agreed upon this, that the next night they would change their host; that the Spider should go to the poor cottages, and the Gowt to the Kings palaces and rich mens houses: the Gowt not unmindful of this agreement, went to a very rich mans house, and lay down at the feet of a very well fed Master, that was very rich, and so soon as this kinde host perceived her, with what humanity, embracings, and cheerefulness did he entertain her! down pillowes were laid under her, all the stools and chairs in the chambers are filled with the best feathers, and cushions laid upon them; the Kitchen was very hot, and all officers at work for provision; the table is spread with all dainties, and the cups fill'd with Wine; fat and cramb'd Capons, Pheasants, Partridge, Peacocks, Quails, Turtles, that feed on figs and grapes, and those birds that have two hearts to set them forth come flying to the table: Turbots, Gilt-heads, Sturgeons, are not worth speaking of. The shell-fish of *Campania* with purple juice, and Oysters from *Abydus*, and whatsoever the whole ocean can afford, are ready. The Wines, are white, black, red, purple, sweet, delicate, sharp, *Cecubum*, *Falerum*, *Chium*, powred forth in full bowls. To say nothing of the second table brought from *Tarentum*, and the dainty cates, with Rose, Violet, and Iacinth coloured. Lastly, no delights, dainties, pleasures, or joyes are wanting, that the rich Gowt, (for she is daughter to *Bacchus* and *Venus*) with her sisters, the hand and knee-gowts, may be entertained delicately. The Spider also as good hap was, light upon a poor Cottage instead of a rich palace, and there she teacheth man and wife what duties are useful for both, and fatts her self with care. But perhaps some man wil object that they can finde no good fortune in this, but only the Spider may be commended for changing her habitation and her host; but it is very fortunate for her: for she lives not only safer, and more at rest, but she doth not from the roof as from a watch-tower, behold any more adulteries, gluttony, riot, prodigality, lasciviousness, plays, dancings, wantonness, dicings, cardings, and lastly those vanities, and beattiness, that never enter into poor mens cottages, whereof she knew her self to be guilty, whilest she lived in Courts and Palaces of great men, who so soon as they had driven forth the Spider, (the mistress of labour and frugality) were presently seized on by the Gowt, and not only so, but all luxury, dissembling, lying, flattering, pride, entred into their palaces, or rather into their ears, eyes, and mindes, and polluted them with all wickedness and companions of all mischiefs: were it not better for Kings to allow this good, frugal, wise, harmless little creature a room in their large chambers, than to hearken to, and to reward so much such pick-thanks, and Court-flatterers, and voluptuous persons, who by their wicked counsel and example will quickly corrupt the best men? I know not whether I Prayles of the Spider from the gifts of her minde.

where she lived in Courts and Palaces of great men, who so soon as they had driven forth the Spider, (the mistress of labour and frugality) were presently seized on by the Gowt, and not only so, but all luxury, dissembling, lying, flattering, pride, entred into their palaces, or rather into their ears, eyes, and mindes, and polluted them with all wickedness and companions of all mischiefs: were it not better for Kings to allow this good, frugal, wise, harmless little creature a room in their large chambers, than to hearken to, and to reward so much such pick-thanks, and Court-flatterers, and voluptuous persons, who by their wicked counsel and example will quickly corrupt the best men? I know not whether I Prayles of the Spider from the gifts of her minde.

No indeed, but the Spider hath a certain divine wisdom given her, as the Poet sang truly,

*Her body moves by vertue of her minde,
Diffused in every part —*

Moreover, so soon as they see an enemy fallen within their nets, they do not presently wound him, or bite him in a hostile manner, but they kisse as it were and tickle him, until they have all smeered him over with a clammy web fetcht out from the hinder parts with their hindmost feet, and have as it were bound him with bands, taking away from him all power of resistance, flying away or moving; then that thred being fastned to their web, they run to the centre to observe, if any new prey may fall within their nets: and thus sometimes you shall see ten or twenty Flies hung up on a line on high, and the Spider will take them one after another, breaking their line they hang by, and fastned to one of the hinder legs, will carry them to the centre of her work, and there devour them: she feeds on nothing but the juice of Flies, and when the carcass is dry and void of all juice, she throws it down as an useless burden to her web. Moreover, because the female is something greater than the male, therefore she hangs under and observes, for fear the small creatures should perceive and take heed, but that they may fall unawares into her net, for by reason of her greater body she is not so fit to catch her prey. But the male is more active, and lies a top, as if he were otherwise imployed, or else seeing all things from a very little hole in his net, he conceals himself that he cannot be seen. And when any by chance comes to his lot, how vigilant is he and intent after his game? for he will not let his prey escape, but he runs from the uppermost line to the lowest suddenly, and when he hath his belly full, he laies up the rest of his provant, and hangs them up by a thred to suck them another time. And when as by age the webs have lost their clammy quality to hold fast, the Spider either new weaves them, or else begleues them anew and repairs them. Her work ended, she either contains her self in her hole, or watching above she holds the thread drawn from the centre, as it were with

with her hands, whereby she can go and come to her nets and retreat at pleasure, and also (if any prey be taken) she perceives it by the motion of her web. But to be more certain, before she comes down, she drawes her thred back sometimes, that she may know how it is by motion and weight. Then first she hastneth to the centre; which the ensnared little creatures either feeling or conjecturing, do lie still, lest by motion they should discover themselves and be more entangled; yet they cannot deceive the Spiders who with feet and eyes perceive their prey, and run swiftly unto it suddenly. But good God, what and how great justice is seen amongst Spiders? None of them robs another of his wife, none of them enters upon anothers house; each of them lives by his own labour and possessions, and they hold it unlawful to break the bands that belong their neighbours:

*But men are not so just, oh pity 'tis to see
How covetous they are, lust reigns in each degree:
Adding house to house, both seas and lands,
And more worlds they fain would have in their hands.*

Farther, they do not pitch their nets for such creatures as are good, and useful, but to catch Hornets, Oxe-flies, Horse-flies, Wasps, Drones, Breezes, Gnats, common Flies, which are to us like bawds, thieves, flatterers (as the Comedian speaks) that breed us many inconveniences, but are no way fit to do us any good. Moreover, she dares (as she is very valiant and magnanimous) hunt after the Lizards young ones, whom she presently involves in her net, as they make resistance, then laying hold of both their lips with a deadly biting, she holds them so fast, that she makes them dye under her. And lastly like another *Cacus* she drawes them backward dead into her lurking place. And if by chance in this great contest, she findes her nets broken or folded together, she presently repairs, unfolds, and spreads them anew with great dexterity. Farther yet, there is a fierce and everlasting feud between the Spider and the Serpent: for if at any time the Serpent seeking shady places, falls upon some places under a tree where many Spiders are, one or other of them will fall right upon the Serpents head with his net, and she will so beat upon his brain with her mouth, that he will make a noise and hiss, and be so vertiginous, that in this miserable condition, he can neither break her thread, nor escape from her. Nor is their end of this combate, till the Spider have destroyed him. Let the *Romans* be silent concerning their battails on the stage, and the cruel combates of Elephants, when a little Spider dares fight with a horrid and wan black Serpent; and not only to fight with him, but to triumph over him, and carry away the rich spoils of her victory. Who would not admire so great force, so great weight, so sharp and hard bitings, and almost incredible strength, in so small a body, and of no consideration, having neither bones, nerves, flesh, and hardly any skin? this cannot proceed from its body, but its spirit; or rather from God himself: In the same fashion they enter the lists with land and water Toads, and kill them in single fight. For not only *Pliny* and *Albertus* the Philosopher mention this, but also *Erasmus* in his Dialogue of friendship, relates, how a certain Monk, who slept with open mouth, and had a Toad hanging at his lip, escaped by assistance of the Spider. Oft-times also they enter the stage with the winged Hornet, that hath a strong sting, and fibres almost of horn, who straight by main force breaks through their webs, as great rich men do with the Laws, yet at last he is wrapt in a more tenacious glew, and pays for breaking open their houses, and conquer'd in single duel, he becomes subject to the Spider.

I must not passe by their temperance that was once proper to Man, but now the Spiders have almost won it from them. Who is there now, (if age will let him) who will be content with the love of one? and doth not deliver up himself body and soul to wandring lust? But the Spider so soon as they grow up, choose their mates, and never part till death. Moreover as they are most impatient of corrivals, so they set upon any Adulterers that dare venture upon their Cottages, and bite them, and drive them away, and oft-times justly destroy them. Nor doth any one of them attempt to offer violence to the female of another, or to assault her chastity. So great command have they of their affections, so faithful and entire are they in their conjugal love, like Turtles. If you respect their household government, what is there more frugal, more laborious, or more cleanly to be seen in the whole world? For they will not suffer the least thread to be lost, or placed in vain; and they ease themselves by interchangeable work; for when the female weaves, the male hunts: if either be sick, the other supplies both offices, that they may deserve alike. So sometimes the female hunts, and the male weaves, and this at any time when the one wants the others assistance; for we cannot think them so void of mutual love, that living so faithful in Matrimony, the one should not lend a helping hand to the others necessities, and so by mutual courtesie they continue their friendship amongst themselves. The female at home being now learned from her Parents to spin and weave (as she is wont to do with us) she begins her webs, and her belly contains all the matter of them, whether it be for that at a certain time her entrails are so corrupted (as *Democritus* said) or that there is a kinde of woolly fruitfulness in her as there is in the Silk-worm. Yet *Aristotle* will have the matter to be without, like a thin shell which is drawn in length, by spinning and weaving; or after the manner of those that shoot out their bristles, as the Porcupine. However it be, they lose not the least

least end of a thred, but they undertake all by providence. Their love to their young ones no man can rightly describe, but he that loves his children himself. For by mutuall incubation, they foster their Egges, and raise up and increase the heat of them; and though oft-times they produce three hundred young ones, yet they bring them all up alike to labour, sparingnesse, discipline, and weaving, and love them all alike. I have oft wondred at their cleanlinesse, when I have seen those that were weak and sick to go down to the bottome of their Web, out of their dens, and exonerate their bellies, left by the filth of their excrements their houses, or Web, or threds should be polluted. And these things shall suffice for their civill and æconomicall vertues. Now let us proceed to their art of making Nets, which is so offensive to *Pallas*, for the Scholar exceeded her Mistris in the curiosity of her work. First therefore we shall consider the clammy stufte that drawes like Bird-lime, which loseth not its tenaciousnesse by driness nor by moisture, we said from *Pliny*, that she drawes this stufte out of her belly. But seeing that the males weave also, I think on good grounds, with our friend *Brueus*, that it is drawn out of the entrails behinde. And since it cannot be exhausted, we may wonder at the infinite and endlesse power of God, and adore it, for it were next to madness to assign this to bodily or naturall causes. Those Spiders are held to be the best Artificers that work in Autumn, and are called *Holci*; they draw a thred that is smaller then any linnen or silk, and farre lighter, and so pure (saith *Ælianus*) that the whole Web wrapt together, will scarce make one thred as great as a linnen thred though it be never so small. *Edwardus Monimus* described these, both Males and Females, very elegantly *Heptam*: l. 7. in these words:

*He hunts at home,
But she doth weave within her tender loom,
And jugler-like, she from her belly casts
Great clewes of yarn and threds, which while it lasts
She works to make her Nets, and every part
She frames exactly by Dedalian art,
Her Web is fastened to the beam, the threds
Are parted by fit lines at severall heads,*

*She works from Centre to circumference,
The Web is made on both sides for defence,
Pervious lest when the East-winde doth set
Strong, it might break this tender worke, and yet
The strongest Flie may be held in this Net.
No sooner can a Flie but shake her threds,
The male runs to the Centre, and his head
Peeps forth to catch what comes, so is he fed.*

The variety of their Nets is so great, that it is not called amisse, the Goddesse of a thousand works; some of them are looser, some thicker, some triangular, others square, some Diamond figures, for the commodity of the swiftnesse of hawking: But that which is round is commonly wrought between two trees, or Reeds, and oft times in divers windowes, hanged fast with ropes, and sail-yards. Good God, what great reason, judgement, art, what admirable wisdom and beauty she shews! Truly we may not suppose amisse, to say that *Euclides* learned to make his figures from hence, and Fishermen their Nets; for from whence else could they fetch such an example of so curious and laborious a Mistrisse? So finely is her work besmeared, and made so round and exact, and so equally ballanced, and she doth so work her body in place of a weight and spindle, that she may well be compared with *Minerva*, but that the comparison makes me afraid. Also the work is so firm, though it appear so weak, that it will hold Hornets, endure force of windes, and dust being fallen into it, it rather yeelds than breaks or is hurt. The manner of her Net-work is this. First she drawes her semidiameters to the places circumabient, most fit for her work, then with no compasse, but by a naturall skill of her feet, she makes 44 circles with her thread from the center to the circumference, by equall parts more distant one from the other. Moreover that is worth our knowing, as also it seemed most admirable to our most learned *Turnerus* and *Brueus*, namely, that those Spiders when they are purposed to fasten a thred from a high beam, in a right line to the earth, they hold a little stone with their feet, and then by degrees they let themselves down by a three doubled thred, that the angle at the earth may answer the angle above by the beam exactly. But that above all the rest is worthy of admiration, how they fasten the first thred on the hither side of the River, and the second on the farther side, whereas Nature hath not taught them to fly, or to swim; I much doubt whether they leap over or not. The second praises in weaving they deserve, that build on the rafts of houses, and other Field-spiders, who upon the grasse weave a Net, that is broad, thick, and plain, and it is a Net indeed, spread forth like a sayl, or sheet. In the work of these Spiders, if you consider the wouf, the skains of yarn, the trendle, the shittle, the comb, the woof, the distaffe, the web, either you will see nothing, or you must see God insensible, yet really performing all these things; and truly in spinning, they go far before the *Egyptians*, *Lydians*, *Penelope*, *Tanaquil*, *Amestris*, *Romes Claudiana*, *Sabina*, *Julia*, and the Queens of *Macedonia*, that were wonderfully skilled in spinning, because (beyond all ordrdinary reason and art) no threds being drawn overthwart, they make a solid and tenacious Web, of a straight continued long thred. Their work being ended, they smear it over with a birdlimy glutinous spittle, by the touch of which alone the prey is entangled, and payes for its blindness and want of foresight. The colour of her Web is aereall and transparent, or rather no colour, which is the thing deceives the Flies that are not aware of it, and they that see best hardly escape it. For had it but any perfect colour, they would think what need they had to avoid it, and fly farther from it. The most ignoble

Y y y

Spiders

Spiders, (namely, those that are sluggish, fat, and that ly in holes) make but a very coarse Web, and grosser thred by farre, which they hang only to holes in Walls. These have a more heavy body, shorter feet, and are more unfit to spin or card; they light upon their prey rather by chance than seek for it, because the hole is great without, and seems a fit place for Flies to hide themselves in; but at the very entrance they are ensnared by the Spider, and caught, and are carryed into the Shambles for Flies to be slain. For they ly deep in Walls, that they may escape the Birds that ly in wait for them (as Sparrows, Red-breasts, Nightingales, Hedge-sparrows) and that they may the sooner ensnare the Flies that suspect no harm. And for Spiders that are harmlesse, and for their webs, let this suffice: Now we shall adde something concerning those kindes I have observed.

CHAP. XIV.

Of certain kindes of Spiders observed by Authors.

YOu may remember that I so divided Spiders, that some were venomous, and called *Phalangia*, and others were harmlesse: Few of the *Phalangia* (and perhaps none) use to spin, but all the rest spend their time in making threds or Nets. Some of these Net-work-

workers are House Spiders, others are field Spiders, so also are those that make threds distinguished.

Amongst the Net-workers I saw one the greatest of all, I have set down the picture of it here. In Autumn amongst small Rose-boughs it extendeth an artificiall Net, and it catcheth either another Spider running over it, or Gnats or Flies that come to it, when she pulls her cord with wonderfull dexterity, and when she hath hanged them thus up, she leaves them till she growes hungry again. She hath a frothy body, Ovall figured almost, it hath a little head with pinfers under the belly, and the back is adorned with white spots: This is one of the Autumnal *Holci*, and in a very short time it will grow from the bignesse of a Pease to be as big as you see her here described. Amongst the Web-makers, we have seen some spin a very fine Web, others spin one that was but moderately fine, some spin base lusse, grosse, rude, and ill favoured: The most subtil work-masters are the House-bred Spiders, whereof we have here set down one of a brown colour, of the bignesse of the figure, and being placed between you and the Sun, it is of some transparency. This is it whose commendation was written by *Cælius Secundus Curio*, and the nature of it by *Pliny*, which taught *Heba*, *Penelope*, the *Egyptians*, *Lydians*, *Macedonians*, and others that were given to spinning. This field Spider weaves a moderate and strong Web in hedges, stretching forth his sheet with a Coverlaid, and where he dwells he waits for his prey. His Web is thicker that it may not rain through, and better to endure the force of windes, she hath a brown body, but feet that are changeable colours, varied with black and white spots in order, she hath a forked mouth, fenced with claws, the two white spots that are seen above in the head I know not whether they serve for eyes, the whole body is gently hairy; she doth stretch out her Web wide and long, that she may catch much prey, to which she is very much addicted. This field Spider spins a base and unpolished thred, and gathers it as it were into a bundle. *Pennius* first observed this kinde in *Colchester* fields between wilde *Origanum* watching for Flies, and he never saw it otherwise. It hath feet like to those described just before, a round

round body like a Globe, the back is marked with white spots, also it hath a fundament four square, and black. Hitherto also we referre three kindes of the Spiders called *Lupi*, who live in chinks of Walls, heaps of stones, and old rubbish: they weave a base and small Web in their holes, and in the day time they wander farther abroad in hopes of prey, which they set upon with great force, and draw into their dens. The greatest of them is of a brown colour, it hath a head almost of Ovall figure, the body as a Globe, both sides are adorned with two

small and short white lines, about the middle of the back it is of a more whitish colour, it hath feet comely with divers black and brown spots: The middlemost is the least, and grey-coloured; the ridge of the back is set forth by three Pearles as it were, whereof that which is next to the neck is greater and longer. The third seems to be blacker, wearing a Crosse overthwart the back very white, and with right angles, and therefore some call it the holy Spider. I conjecture that these are of the Wolf kinde, because they run with a kinde of leaping, and discover a great ravening appetite, for they lay up nought for the morrow, but consume all their provision in one day. *Gesner* saw one of this kinde that was Ash-coloured. There

are also Spiders with long shanks, that make disorderly and most rude work. The field Spider with a body almost round and brown, that lives about grasse and Sheep, the English call it *Shepherd*, either because it is pleased with the company of Sheep, or because Shepherds think those fields that are full of them to be good wholesome Sheep-pasture, and no venome to be it, (for this Shepherd taken inwardly, or outwardly applyed, is a harmlesse Creature.) There are yet more kindes of Spiders, for there is a kinde of black Spider, with short feet, that hath a white Egge under the belly, white as snow, and running swiftly; when the Egge breaks,

many young Spiders run forth, which go all with their Dam to feed, and at night they rest upon the Dams back. *Pennius* supposed that this was rough with warts, untill he touched it with a straw, and saw the young Spiders to run down. Also in rotten hollow trees there are very black Spiders, with great bodies, very short feet, that dwell with Cheellips, and Caterpillers called *Juli*. Also saith *Gesner*, we have seen them all white, with a compacted and broad little body, upon the flower of Mountain Parsley, Roses, and grasse, they have most long slender legs, the mouth is noted with a spot, and both sides with a red line; he thought it was venomous; because he saw a Munkey almost dead that had eaten one, and could hardly be recovered by powring Oyl down his throat.

We know also Spiders with a long body, and a sharp tail, they are red from black, as also green. Also there are red ones of two kindes, one great one that dwells only in the Caves of the earth, with a body Cinnabar colour, with feet yellow from red, the tail and belly tend toward yellow a little from brown. There is another sort very small, lesse then a Sheeps Tike, as red as Scarlet, it hath but six feet, being a monster amongst Spiders; it hath a head like as Spiders have, but it is very small: It lives in the earth, and weaves a very course Web, and not well wrought; sometimes she wandreth abroad, and shews great agility to catch her prey. We grant willingly that there are more kindes of Spiders, and of more colours, for our land brings not all things forth, nor yet did *Alectorides*, though he was called *omniscius*, see all things. It may be future times may delineate the rest better. In the mean time

we have spoken of Spiders if not to delight, yet according as we thought fit, and we would do no more, because in writing so much of them we have taken great pains: Yet this we shall observe, that all Net-workers, and Web-workers amongst Spiders, do grow to have greater skill by age, and that shut up in Wooll, they increase the generation of Moths, and they yearly oft times cast off their old skin, and the greater and lustier they are, the more ingenious are they found to be in their gifts of life.

CHAP. XV.

Of the generation, copulation, and use of Spiders.

Generation.

Copulation.

The use.

IT is manifest that Spiders are bred of some aereall seeds putrefied, from filth, and corruption, because that the newest houses the first day they are whited will have both Spiders and Cobwebs in them. But their propagation is frequently by copulation, the desire and act whereof lasts almost all the Spring. They do by a mutual and frequent attraction of their Nets, as it were kindle venery, and continually as they draw, they come neerer, then at last they copulate backwards, because that manner of copulation, by reason of their round body was most convenient: After the same manner do all the *Phalangia* that weave, copulate together, and they are generated from creatures of the same kinde as *Aristotle* testifies. But they copulate not in the Spring, but at beginning of the Winter; at which time they go fastest, and hurt certainly, and seem to be more venomous. Some after copulation lay one Egge alone, and carry it under their belly, and it is white as snow, and they sit on it by course, the male sometimes helping the female. Others lay many and very small Egges, like Poppy-seeds, out of which sometimes thirty small Spiders are bred, after some trifling sports in their Web, they go forth with their Dam, and in the evening they come in again, untill such time as each of them hath learned to spin its own Web, to live more safely and pleasantly, they thrust forth their young by leaping, they sit on their Egges three dayes, and in a Lunar moneth, they bring their young to perfection. The House Spiders lay their Egges in a thin Web, but the field Spiders in a thick, because they may resist the greater forces of winde and rain; the place helps much for Generation. For as in the Countrey of *Arrhenia*, and in the Island of *Crete* there are great store of *Phalangia*, so in *Ireland* there are none; they did not long indure in *England*, the Tower at *Gratianopolis* would suffer none, for though many of our Spiders swallowed down do hurt us, yet their bite is harmlesse, and no man is killed by it, but the bitings of all *Phalangia* are deadly. Where shall you not finde these Spiders that bite without doing hurt? they climbe up into Kings Courts to teach them vertue: they work in Noble mens Chambers to teach them their Duties: they dwell in poor mens houses to teach them patience, to suffer, and to labour: Goe but into your Orchard, and each tree is inhabited by them, in your Garden, they hide in Roses, in the field they work in hedges, you shall finde them at home and abroad, that you may have no cause to complain that there are no examples for vertue and diligence every where. The Spider, though *Pallas* called her impudent, *Martial* unconstant, *Claudian* bold, *Politian* pendulous, *Juvenal* dry, *Propertius* corrupt, *Virgil* light, *Plautus* unprofitable: yet is she good, and created for many uses, as shall appear clearly; wherefore adoring the Majesty of God who hath given so great vertues to so small a Creature, we shall proceed to speak of the profits we receive by her. The Flie-catching Spider wrapt in a linnen cloth, and hang'd on the left arm, is good to drive away a Quotidian, saith *Trallianus*. But better if many of them be boyld with Oyl of Bayes to the consistence of a Liniment; if you anoynt the arteries of the Wrists, the arms and Temples before the fit, the Feaver abates, and seldom comes again. *Kiramides*. A Spider bruised with a plaister, and spread on a cloath and applyed to the Temples, cures a Tertian. *Dioscorides*. The Spider called *Lycos*, put in a quill, and hang'd on the breast doth the same. *Pliny*. That House Spider that spins a thick fine and white Web, shut up in a piece of leather, or a Nut-shell, and hang'd to the arm or neck, is thought to drive away the fits of a Quartane. *Dioscorides*. *Pennius* saith he proved it to be true. Three living Spiders put into Oyl, let them presently boyl on the fire, drop some of that Oyl warm into the ear that is in pain, and it profits much. Or presse out the juice of Spiders with juice of Roses, and put it in with Wooll. *Marcellus Empir.* *Pliny* bids infuse them in Vinegar or Oyl of Roses and stamp them, and then drop some into the ear with Saffron; and it will kill the pain certainly: *Dioscorides* affirms as much. *Sostratus* the *Saxan*, saith, that *Cranocolaptes* (a certain Spider) drowned in Oyl is a present remedy against poysons, as the Scholiast of *Nicander* professeth. Some catch a Spider with their left hand, and bruise her in Oyl of Roses, and drop some of it into the ear of the same side the tooth akes, and *Pliny* saith it is a cure. Laid upon their own bites, and taken inwardly they help us. What should I speak of the *Albugo* of the eye, a most hurtfull disease? Yet that is taken away very easily by the help of one Spider, if you do but bruise the longest and slenderest feet (especially of that kinde of Spiders that are the whitest) with Oyl, and anoynt the eyes affected with it. *Pliny*. Also the running of the eyes is stopped, (which the *Greeks* call *Empoeia*) with the dung and urine of a House Spider dropt in with Oyl of Roses, or one dram of Saffron, or else laid on alone with Wooll: whereby you may know that there is nothing so filthy in a Spider that is not good for something. *Aetius* for suffocation of the mother, applyed a Cerate of Spiders to the Navel, and saith it did great good. *Pliny* saith, that Spiders help the swelling and pain of the spleen, but he tells us not his reason. He saith moreover, that if any man take a Spider coming down with his thread, and bruised in the hollow of his hand, do lay it to the Navel it will cause a stool, but if he takes him climbing up,

up, and applies him, it stops the belly. He writes also that a Spider applyed to one that knows not of it, and taken off the third day, will cure a *Felon*. The head and feet being taken away, it helps swellings of the Fundament. *The same Author*. By the fume of Spiders all the Lice fall down and never breed again. Goose-grease and Oyl of Roses with a Spider annoynted on the breasts, keeps the milk from curding in them. *Anonymus*. Also that knotty Whip of God, and mock of all Physicians, the *Gowt*, which learned men say can be cured by no remedy, findes help and cure by a Spider layd on, if it be taken at that time when neither Sun nor Moon shine, and the hinder legs pulled off, and put into a Deers skin and bound to the pained foot, and be left on it for some time. Also for the most part we finde those people to be free from the *Gowt* of hands or feet, (which few Medicaments can doe) in whose houses the Spiders breed much, and doth beautifie them with her Tapestry and hangings. Oh the rare miracle of Nature! O the wonderfull vertue of a poor contemptible Creature! O most happy rich men, if they knew many of them how to make use of a thing ready to do them so much good! *Antoninus Pius* was wont to say, that the quirks of Sophistry were like to Spiders Webs, that had a great deal of art and ingenuity in them, but very little profit. But how often hath the bloud run forth of the body most miserably by a fresh wound? yet it had been easie to have stopt it by laying on a Spiders Web, something thick, and binding it fast on, were we but more attentive to look to such remedies that God affords us in our houses. But we are greedy after forain remedies, fetcht from farre, as if they were better than we bring with great pains from the farthest *Indies*, or more healthfull because of their greater cost. But unlesse mad affection did drive us, as if we were Gad-flung, through all the places of Sea or Land, to finde remedies to stop bloud, cure Ulcers, hinder corruption, drive away inflammation, knit wounds, one Spiders Web would do more good than *Sercocolla*, *Sandaraca*, Bole brought from *Armenia*, *Terra Sigillata*, *Argilla Samia*, *Terra Lemnia*: For it bindes, cools, dries, glutinates, and will let no putrefaction continue long there; wherefore it suddenly stops all bleeding at the nose, (as also bleeding of the Emrods, and bloud in a Dysentery, Menstrual bloud, and all over great evacuations of bloud by the opening of the mouths of the veins) whether you give it alone with wine inwardly, and lay it on outwardly, or else mingle it with Bloud-stone, *Crocus Martis*, and other things of that kinde. Also the Spiders web is put into the Unguent against *Tetters*, and applyed to the swellings of the Fundament, it consumes them without pain. *Marcel. Emp.* Also *Pliny* saith it cures runnings of the Eyes, and layd on with Oyl it heals up wounds in the joynts. Some rather use the ashes of the webs with *Polenta* and wine. Our Chirurgians cure warts thus: They wrap a Spiders ordinary web into the fashion of a Ball, and laying it on the wart, they set it on fire, and so let it burn to ashes; by this means the wart is rooted out by the roots, and will never grow again. *Marcellus Empiricus* was wont to use the webs of Spiders found in the Cypress tree, in a remedy for the *Gowt*, to ease the pains. For the Tooth-ache, *Galen* 5. *lib. 10.* out of *Archigenes*, commends highly Spiders Egges, mingled with Spike Oyl, and put into the tooth: Also *Kiranides* gives Spiders Egges to drink against a Tertian; whence we conclude with *Galen ad Pison*. From the Spiders web we may understand enough, that Nature hath made nothing so vile, but that it serveth for its necessary use; if so be Physicians would use more diligence, and would not disdain to enter into the wood of such things as are easie to attain. Now I will proceed to other things, lest if I stay too long in the History of the Spiders, I may indeed be said to weave the Spiders web; yet I will add this, that Munkeys, Apes, Strellions, Lizards, Wasps, Ichneumons, Swallows, Sparrows, Muskens, Hedge-sparrows, feed on Spiders. And the Nightringale, that is the chief of singing Birds, is cured from some diseases by eating of Spiders. When *Alexander* reigned, it is reported that there was a very beautifull Strumpet in *Alexandria*, that fed alwayes from her childehood on Spiders, and for that reason the King was admonished that he should be very carefull not to embrace her, lest he should be poysoned by venome that might evaporate from her by sweat. *Albertus* also makes mention of a certain Noble Mayd of *Colen*, that was fed with Spiders from her childehood. And we in *England* have a great Lady yet living, who (as we said before) will not leave off eating of them. I cannot but repeat a history that I formerly heard from our dear friend worthy to be believed, *Bruerus*. A lustfull Nephew of his, having spent his estate in rioting and Brothel-houses, being ready to undertake any thing for money, to the hazard of his life; when he heard of a rich Matron of *London*, that was troubled with a Timpany, and was forsaken of all Physicians as past cure, he counterfeited himself to be a Physician in practice, giving forth that he would cure her and all diseases. But as the custome is, he must have half in hand, and the other half under her hand, to be payed when she was cured. Then he gave her a Spider to drink, as supposing her past cure, promising to make her well in three dayes, and so in a Coach with four Horses he presently halts out of Town, lest there being a rumor of the death of her (which he supposed to be very neer) he should be apprehended for killing her. But the woman shortly after by the force of the venome was cured, and the ignorant Physician who was the Author of so great a work, was not known. After some moneths this good man returns, not knowing what had happened, and secretly enquiring concerning the state of that woman, he heard she was recovered. Then he began to boast openly, and to ask her how she had observed her diet, and he excused his long absence, by reason of the sicknesse of a principal friend, and that he was certain that no harm could proceed

ceed from so healthful physick; also he asked confidently for the rest of his reward, and to be given him freely. Truly in this present corruption of manners and times, how highly is such a Mountebank esteemed, wherein chance is accounted for skill, and one accidental rash cure of a disease, with danger oft-times of the patients life, makes a Quacksalver a great Physician, and he is judged worthy of praise and honour? But a better revenging Judge will correct these things; we pass on to Pismires.

CHAP. XVI.

The commendation of Pismires; wherein we shall describe their Differences, Nature, Ingenuity and Use.

TO begin with the commendations of the Pismires, I know not whether I shall first speak of their body or minde, since Ants for both are not only to be preferred before many Insects; but also before many Men; for they are not one ey'd, nor horrid skew-ey'd, nor do they walk with crammed guts, as *Ballio* doth in *Plantus*, nor yet are they mishapen, crook-leg'd any way, gorbellied, over close kneed, blub-cheek'd, great mouthed, lean chopt, rude foreheads, or barren, as many great Ladies, and noble Women are, who have lost the faculty of generation; but the beauty of their body follows the goodness of their minde, and nature hath given them for their degree and order, a constant and absolute perfection. *Cardan* was the first said they were blinde, because their body is small; not remembering that there are many Flies and Gnats that are far less than Ants, yet they have eyes and can see well. If they were blind, I see not what the light could profit them, and they would work as well in the night as in the day. I confess that their foreyards serve them for a staff to prove the way, not that they do not see what way they go, but because by those means they try the hardness and softness of things. They have a very little head, but round as the heavens are, wilde brain'd, set with eyes, a mouth with teeth, and a throat not without a tongue and a palate; they have a square breast with ribs to defend it, with lungs, or bellows that supply their room, that are so firm, and yet loose, that they never grow out of winde by labouring, but alwayes draw their breath most freely. They have a stomach in their belly that is strong to digest venome, (for they feed often on Serpents and Toads) and they are very hot in the matrix, and very fruitfull, to their commendation. What should I here mention their swift walking, and their equall motion when they goe? for they not only out-goe pack-horses for the proportion of their bodies, but out-run the swiftest Chariots. They vary in colour, according to the difference of their kindes and places. For there are red ones in *Mauritania*, and the Inhabitants of *Budemelum* have white ones. In *Europe* they are most an end black ones, yellow, and somewhat red from tawny. Here they seem very short, smaller, fine necked, slender, and weak bodied; yet these will carry a weight thrice as great and heavy as themselves; and those in *India* of a great bignesse, will carry great pieces of flesh with them, and devour it.

Their praise
from their
minde.

*Their bodies you have seen, now see their minde,
It's a sparing and laborious kinde,
And holds and keeps whatever she can finde.*

Virg. 4. Aeneid.

Truly, as often as I remember the profuseness of *Caius Julius Caesar*, the luxury of *Caligula*, the prodigality of *Nero*, the excessive gluttony of *Apicius*, and the great waste of *Heliogabalus*; so often do I exceedingly commend the wit and ingenuity of the Pismire, and prefer her prudence before that of Men. I know that they lived sweetly, and with fat patrimonies from their fathers, they gained large inheritances; yet they found out new use of baths, dangerous kindes of meats, curiosity in banquets, ships made of cedars adorned with Jewels, the drinking of pearls, and they wasted as much in one year, as they could extort for tributes and customs, or by plunder both at home and abroad all their life time. *Licinius Crassus* had formerly much riches, who being brought to need, was laught at by all that met him, and the people in a jeer, called him the rich *Crassus*. And (Oh God!) saith the Comedian, what a miserable thing it is for a man to have had a great estate formerly, and to have nothing now? how much better were it for us to imitate the Ant, who gathering corn in Autumn, doth not waste it prodigally in Winter rioting, but keeps it providently for future use, and daily store? Hence it is that she is never tortured with hard poverty, nor is she tossed on the billows of cross fortune, nor is she indebted or in danger by borrowing from others; nor doth she seek from other creatures either work, or sustenance to maintain her, and keep her in health: and if frugality comes from fruits, as the Etymologist derives it, (for our Ancestors, the Masters of old sobriety, scarce knew any other diet) it is very credible that that vertue is passed from our first parents into the Pismires, who feed only on dry corn to maintain their lives, and avoid all superfluity of many dishes. Hence the Poet elegantly feigned that the *Myrmidons*, the most excellent people of the Greek Nation (if you consider their

tempe-

temperance, their labour and their diligence) were descended of the Pismires. For whence could they have gotten so great abundance of riches and goods, unless by an Emmets prudence they had preserved what they had gotten and laid up to prevent poverty? And as sparing in keeping, so diligence in getting, and wisdom and industry is found to be admirable in them. They take a very commendable way first to preserve their life, then for their posterity, and lastly to provide their victuals. First of all, they build themselves an house, as in the golden age, not covered with tyles for delight, but with green turfs, and not made of bricks, but fenced with mud-walls. Histories do mightily magnifie the Pyramides, and trenches of *Egypt*, and the Labyrinth of *Crete*. But no man can sufficiently set forth the excellent work of trenches that the Ants make, the figure, the magnificence, the turnings, windings, and revolutions thereof: for these by an unspeakable prudence, beyond all mans art, make houses under ground with such strange turnings, that they open only the way that is unaccessible to others, and is not possible for any that would do them wrong to enter at. First they make the earth hollow with their tender nails in the place of spades; and to throw the earth forth, they use their hinder feet for shovels: hereby they cast up a mount, and fence it about as with wals or forts; then they cover their work with chaffe, straw, leaves, bowes, bark, and pieces of sticks, and laying on new matter, they raise a tower that may be seen afar off, (called an Ant-hill) which is far higher and more sloping than the foundation, partly that their houses may not fall by rain staying about them, and partly that they may live the more healthfully by reason of the air that penetrates and passeth through. This divine little creature fetcheth the fashion of its building from heaven, either because their multitudes required room, or their excellence required the best. The entrance is not right forth but turning with many labyrinths and mazes; they distinguish their chambers in this tower of theirs in a threefold order, yet it is so hard to come into them, that *Argus* who was all eyes, may be often deceived in them. The first room is large enough, like the Presence-chamber, where they all meet, and convene, we call it the universal Congregation house of Ants: under this for the females, there is the feminine room arched by *Dadalean Art*, wherein the eggs are laid safe that they may produce their young ones, it is made lest they should be thought careless of posterity. The third chamber is most inward, and most safe from showres, and that is built for their store-house for their corn, that as it were in a granary they may lay up their belly-timber, and may fence it well from the winter cold that searcheth into all things; the adjacent parts and outmost skirts of their castle they appoint for a place of burial, and there they bury their dead with honour and state. And this is the manner of their building, plain indeed, and within the ground, as were the houses of the wise men of elder times, before that pride, and the head-strong ambition of *Ninus* invented to build up towers to heaven. Since his death, shall I speak of Kings or Princes? Truly there are some Citizens of the lower bench, who with extraordinary charge do build up, not an Ant-hill, but *Mausoleum*, or a prison for their bodies, and adorn it with all the cost and art they can; worthy they are indeed to be devoured by Pismires whilst they live, that dying by the force of a wise Creature, they may suffer for their folly. Nor do Ants build houses that are places for idle people, or such as are mischievous to harbour themselves in, but every one, yet without any Commander, followes some honest labour, and for the good of their democraticall state, each one mutually employs his pains by turn. For they all, like those that labour in the Mines, do stoutly exercise themselves in digging of trenches, some serve to repair their houses, to adorn them, and to keep them clean; others with great assemblies and funerall solemnities bury their dead, in the place of buriall adjacent; others again visit the sick, and out of their Granary they fetch some Physicall grain, (for they have Corn and grain almost of all plants) and prepare that and carry it to them. They have Officers of all sorts, as Purveyours for Corn, Gleaners, Storers, Yeomen of the Larder, Housholders, Carpenters, Masons, Arch-workers, Pioners; for such is the vertue and skill of every one, that each Ant knows what is needfull to be done, and willingly doth his best to help the Common-wealth. But in their ordinary work what labour and diligence do they use? If they be minded to build an Ant-hill presently, or else are forced on a sudden to raise a new house, the old one being undermin'd and decayed by the Moles digging under them, they go forth all in troops, and from the rubbish of their houses thrown down they build new ones hard by. First they gather together their scattered Egges, and Corn, and put each of them in their proper places, afterwards they repair their hill, and covering and thatching that well, they keep all safe and dry: when the Sun shines, when they go forth to fetch Corn, the greater and elder go before them as Captains, the rest follow after. They creeping up to the top of the stalk, bite off the ears of Corn, and the young ones stay and gather them up, and the Chaffe being fallen off, they pull the Corn out of the husks, and then they carry it home; and the end of it being eaten off, if there be necessity, they set it at their doors a sunning, and when it is ventilated they lay it up again. When gleaning is done, they frequent the threshing floors, and there not by stealth, but openly they take sustenance for their lives, and they enrich their treasury. Which labour of theirs *Virgil* wittily describes in these Verses,

*As when the Ants plunder a heap of Wheat,
Minding cold Winter, store is up for meat.*

Their

*Their black Regiments through narrow wayes passe,
And carry their prey over fields of grasse,
Some bear the burden, some them forward drive,
Chastning delays, who shall work most they strive.*

Wherefore not unfitly did the Prince of morall wisdom, send those sluggish and slothfull Monsters of Mankinde (who like Mice live alwayes on other mens labours, and goe from dore to dore like Vagabonds to beg a peny) to learn wisdom of the Ant, that by the example of the Ant, they may use opportunity, and lay aside begging, esteeming labour much, which is the Merchant for all that is good. Hitherto belongs that of the *French Poet*.

*Poor Sluggard who dost live in penury and want,
Behold the household prudence and wisdom oth' Ant,
Lest she should stand in need, which she doth greatly fear.
She gathers in one moneth, to serve her a whole year.*

This is their diligence in gathering, their care in preserving, their prudence in storing, their economicall skill in distributing what they have laid up. I shall shew you also their modesty on the way, which me thinks should not be over-passed. For though they go in a narrow way, yet are there no brawlings, contentions or strivings for it, nor yet any murmurings, or fightings, or slaughters amongst them for place, (as it is usuall amongst proud men.) But the younger gives place to the elder, and he that carries no burden, to him that is loaded, and each of them is ready modestly rather to passe by an injury, then Waspishly to offer one. If any man compare their burdens with their bodyes, he will confesse that no Creature hath more strength, considering their proportion. They carry their burdens in their mouths; the greater burdens they attempt to take up backwards with their hinder feet, and lay their shoulders to them with all their might. They have all a care and mindefulnesse and endeavour for the publick good. They store up the seed they first bite, lest they should grow again in the earth; when they are subject to grow mouldy, and are wet with rain, they bring them out and dry them in the Sun, wipe and torrefie them, and then they lay them up in their Granaries again. The greater seeds they divide at the entring. They work also at the full Moon in the night, (as good Mowers are wont to do) and when the Moon is in conjunction and hid, then they forbear labouring. But what pains do they take in labouring? How diligent are they? And because they work in divers places, to come home with it, the one not knowing what the other doth; Certain dayes (saith *Pliny*) are appointed for a generall survey, and meeting to enquire into the businesse, what running together of them is there then? how civill is their conversation? how complementally do they salute one the other? how diligently do they seem as it were to talk together, and to make enquiry? You shall see Flints worn in the path they goe, and a path made in Marble stones, that no man may doubt but that diligence will doe something in any matter; for they all goe almost in the same path. For if one carry a burthen too heavy for him, the rest in the way will come and help him, lending their legs and shoulders, if it be a light burthen the fewer come to assist, if a weighty, more come, and either draw back, or thrust forward, or if the burthen be too great, by biting it in sunder, and dividing it, they promote their businesse: And by this means they bring home a great heap of straw and sticks to their houses. Now if any will attempt to hinder the Ants in their labour, (as the Serpents and Toads often doe when they meet them,)

*— They fight and will not flie,
And hold it noble in these wars to die.*

For then (making as it were an agreement) they conspire together, and with horrid and cruell bitings, they destroy the enemy. He that hath not fastened upon the common enemy, thinks he hath deserved little of the Common-wealth, and upon that score they fight. In the time of harvest, when such an accident falls out, they do not meddle with a dead body, but presently as the enemy is vanquished, they fall to their labour again, and they gather up again the Corn they laid aside before the battell, and lay them up; for they hold it no prudence to stay to plunder, when greater businesse doth require their industry, and they hold it ignoble to contest with those that are dead. They feed chiefly on grains of Wheat, Winter Corn, Barley, and hard meat which they delight in. They take great pleasure in Cyprus Nurs, and the tender flowers of herbs that are red. They eat Scorpions (called *Geraret*) saith *Rhasis*, and they feed on the Carcases of Serpents and Frogs when they are hungry. Otherwise they abhorre to eat corrupt and venomous things; nor will they touch fruit polluted with Menstruall blood, nor taste of them. Have not men by reason of hunger been compelled to feed on Horses, Wolves, Serpents, grasse, and dead bodies in time of narrow sieges? That is sufficient to prove their cleanliness, that they carry out their dead in the husks or bladders of trees and Corn, as of old time the *Romans* buried their dead in pots, but they now carry them forth on Biers. They delight to live in clean houses, and for that purpose they do not lay their dung, (that is like

like to Urine) within doors; and when they travell through dirt, and are bedawbed, at the entrance of their houses, they rub themselves clean against some rough bark. They love and take such care for their young ones, that they alwayes carry their Egges in their bosomes, so long as they are little, and not so overgrown that they hinder their labour; but then they lay them up in their deep hollow Cave, that they frustrate the birds that prey upon them, as the Wood-pecker, the Nightingale, and also the Bear. But so soon as the young Pismires come forth of the Egges, they immediately shew them the way to labour and take pains, and if they refuse to work they will give them no meat. Hence you may observe that they set every one his task: The stronger with their mouths, feet, little noses, do cast up the earth, and when they have cast it forth, they make it up in heaps, when they heap it up, they mingle straw with it, that it may lie light, and lie hollow. The wiser sort of them do build, the lesser of them remain in their trenches, and work; the more expert make windings like Meanders and Labyrinths, and frame vaulted Chambers. If they observe any to be idle, they not only drive them out, pinched with famine as a base breed, but they bring him before the door, and calling a Councell of them all, they put them to death, that their young ones may take example, that they may not hereafter addict their mindes to sloth and idlenesse. The dayes appointed for labour and gathering Corn, they set venereous action aside; and chiefly in Winter, (when there is neither sowing nor mowing) they couple together: yet for modesty sake they use venereous actions within doors, as the Bees do, at this time they make much of their Females, and when they are great with Egges they embrace and love them most. Above all they take care (O wonderfull love to their young ones) that nothing may be wanting to their off-spring for food or instruction. He only can doubt of the valour of Pismires who never saw them fight, nor heard the report of their battels. For they are not only full of choler, (as the proverb is) but they have a purpose to fight, so that they either joyn battell with externall enemies, or else hold civill warres amongst themselves, when they want food. For though Pismires never fight when their Granary is full, and their Democraticall Government stands fast whilst they have plenty of food; yet (what we read to have hapned in the best ordered Monarchies) in a dearth, or rather want of provision, they fight desperately for food, and for their lives, and the lesser of them will rebell against the greater, (as being the greater gulphs of the Common-wealth.) It is the nature of necessity to give and not to take Lawes, and then chiefly when the belly a troublesome Client, doth feed on it self, and the guts croke and are empty. There are few juster Kings then *Lyfsmachus* was said to be, nor were there better subjects then the *Athenians*, yet both of them did many things disorderly in famine, and he gained thereby to be branded with the name of a pusillanimous, faint-hearted Prince, and they of rebellious Subjects. Therefore this warre of the Pismires is to be commended, that is not undertaken for a Crown of Ivy, Bayes, or of Gold, or of Grasse, (which was accounted the most ancient) but from intestine necessity, and nature leads them to it; for neither could *Solon* himself endure thirst, nor *Solomon* conquer hunger. For these will dig under all walls, will be held by no bands, and they only know neither Lawes nor bounds. *Aeneas Silvius* relates a strange history of this fight, *lib. de Europa, c. 50.* His words are these. In the County of *Bonomia*, many little Pismires that were hungry, clambered up a dry Pear tree to seek for food, the greater Pismires came upon them in no small number, and these took the meat out of their mouths, and killed some of them, others they threw down, those that were cast down returned to their Ant hill, or fort, in the way they meet with others, and seemed to talk with them, and rip up the injury they had received, and they bring forth all the forces they had, and their companions out of their tents. About two hours almost afterwards, so many bands of the lesser Pismires, and such a mighty Army drew forth, that the whole field appeared black by these black souldiers; they came all well guarded, and compassing the stock of the tree round, they began to climbe up. The greater Pismires when they saw their enemies at hand, drew close into a body to receive the encounter aloft; so soon as the Armies met and fought, the great ones killed abundance of the lesser ones with fierce biting them, and they destroyed all those in a terrible skirmish that first ventred up, that at the root of the Pear-tree there lay a great heap of them slayn. The rest of the little Pismires and the middle Army would not be daunted by this, or run away, but they recollect their forces, and attempt to be revenged, and following more risly, and pressing one Army after another, they mounted up the tree in greater numbers than before, and they bite their enemies on the back, on the sides and in the front, and they forced them to yeeld, and leave the tree. The greater Pismires were much too strong for them, but the numerous multitudes of the little ones prevailed against them, and twenty at least set upon one. This happened when *Eugenius* the fourth was Pope, *Nicolaus Pistoriensis* a most learned Lawyer standing to behold it, and he related the manner of the fight sincerely and truly. *Olaus Magnus* reports the like accident to have hapned at *Upsal* and *Holmes*, before that barbarous and cruel Tyrant *Christianus* the second was driven forth by the Inhabitants of *Smeden*, from ruling over the *Goths* and *Svedes*. In which battel, that must not be forgotten, the lesser Pismires after they had won the field interred the bodies of their fellowes, leaving their enemies exposed to the Crows and Munkins; also they made choice of a high Tower for the place of combat, as if they would with a clear voice call and draw unto them the prodigy of Tyrants and his followers, to see their destiny

destiny revealed, and the punishment that hang over their heads. Also they hurt Elephants and Bears, but not unlesse they be first hurt by them. They afflict Serpents and Dragons and make them mad, but it is either because they hinder them in their labour and stop the way, or because they breath their venomous breath into their caves and turrets. Grasshoppers and Dormice they hate exceedingly, those because they spend the Summer time in singing, these because they lose the Winter in sleeping, for a Common wealth well regulated doth punish idle persons as well as those that are wicked, and the *Spartans* were wont to cast forth those that would not labour. They live very long, and would hardly ever die, unless the Birds did catch them before their time, or the floods and waters drowned them. They are for the most part very healthful, because they observe those three rules of *Plato* very exactly, mirth in labour, temperance in diet, and sparing in venereous actions. For what creature labours more chearfully, diets more moderately, or did nature ever produce that is more temperate in venery? Also there is in them many seeds of domestick discipline, justice, friendship and other virtues; and had we the like, either by nature or by art in us, we would scorn to live basely on the labours of others, and we would refuse to be slaves to our bellies. Moreover they have some sense of future things; for before a famine they labour exceedingly, continuing their work night and day, and every where laying up a great store, as *Juvenal* hath it *Satyr 6*.

Hunger and cold away drive,
And from the Ant learn thou an art to thrive.

Since therefore (to wind up all in a few words) they are so exemplary for their great piety, prudence, justice, valour, temperance, modesty, charity, friendship, frugality, perseverance, industry, and art; it is no wonder that *Plato* in *Phedone*, hath determined, that they who without the help of Philosophy have lead a civill life by custom or from their own diligence, they had their souls from Ants, and when they die they are turned to Ants again. To this may be added, as I related before, the fable of the *Myrmidons*, who being a people of *Aegina*, applied themselves to diligent labour in tilling the ground, continual digging, hard toiling, and constant sparing joyned with virtue, and they grew thereby so rich, that they passed the common condition and ingenuity of men, and *Theognis* knew not how to compare them better then to Pismires, that they were originally descended from them, or were transformed into them, and as *Strabo* reports they were therefore called *Myrmidons*. The *Greeks* relate the history otherwise then other men do; namely, that *Jupiter* was changed into a Pismire, and so deflowred *Eurymedusa* the mother of the *Graces*, as if he could no otherwise deceive the best woman, then in the shape of the best creature. Hence ever after he was called *Pismire Jupiter*; or, *Jupiter King of Pismires*. For the generation of Pismires are endowed with so much virtue and justice, that they need no King to govern them, for each of them can regulate his own passions; or if they have any King, it is the Supreme *Jupiter*, that governs all, who is deservedly thought to be the Fountain and Authour of all virtue both in Men and Pismires, and all other creatures. For there is none amongst men that doth govern better then the Pismire; and we that should teach them (as saith *St. Hieronymus*) may learn of them divers things that are necessary for our souls and bodies. For when contrary to their nature and industry they hide themselves, we are certain that rain is not far off; and when we see them running here and there, and carrying their egges before them, we are warned thereby of great winds and tempests. Also those that are well acquainted with Country learning, when they see the Pismires run here and there, extreme fast, twice as much almost as at other times, and take such huge pains in gathering and storing up Corn, they are warned of a famine at hand, and so buy up all the Corn they are able. For they more rightly and certainly by their naturall magick foresheew Tempests, then our Soothsaying Almanack-makers, that are derided and exploded for vain fellowes by all godly and truly learned men. For let *Ennius* be heard;

They that are out shew other men the way,
And promise riches who have none to pay.
To whom they promised to them they pray.

Nor doth *Accius* lesse elegantly describe them, who was the chief in writing of Tragedies, in his *Attich* we read thus;

I trust no Wizards, who have learn'd the skill,
With gold their houses, others ears to fill.

They do better in my opinion who observe the Pismire, and grow rich by following his manners in labor, industry, rest and study. We read of *Midas* that he was the richest King of all the West, and when he was a boy, the Pismires carryed grains of Wheat into his mouth whilst he slept, and so foresheewd without doubt that he should be endowed with the Pismires prudence, and should by his labour and frugality gain so much riches, that he should be called the *Golden boy of fortune*, and the darling of prosperity. *Ælianus*. And when the Ants did devour and eat up the live Serpent of *Tiberius Caesar*, which he so dearly loved, did they not thereby give him sufficient warning that he

he should take heed to himself for fear of the multitude, by whom he was afterwards cruelly murdered? *Suetonius*. They do teach us by their example of labour and virtue, both because they do inculcate unto us parsimony and perseverance, and also because when they are grown rich they maintain perpetual and inviolable friendship. For though at such a time one man is a wolf to another, and the desire of having more increaseth with gain, (which the *Greeks* call *πλεονεξία*, Covetousness) yet as the *Comedian* speaks;

*In good or bad what ere it be,
The Ant with Ant doth still agree.*

And they never fight and jar but upon occasion of extreme famine. *Horace* chargeth them with Covetousness, because they alwayes heap up more; but since they do that for the common welfare, that reproach of his is not their fault. But they eat Serpents, and live sometimes on venomous things: I grant that, and may be they use it for their Theriac, and are not therefore Pismires to be commended? Yes as well as the Storks, they ought to be fed from the common Treasure, and I might say to be adored as well as the *Indian* Rat *Ichnemou*. In *Isthmus* the Priests sacrificed Pismires to the Sun, either because they thought the Sun the most beautiful, and therefore they would offer unto him the most beautiful creature, or the most wise, as seeing all things, and therefore they offered unto him the wisest creature. But you will say, they are most hurtful creatures to Vines, to Dittany, to young shoots, and to many tender plants, and *Pliny* calls them the plague of trees. But *Gellius* calls them more properly the revengers and judges of idle people; for they by their labour call us out of our lurking holes, and drinking houses, to till our grounds, and take care of our Orchards more diligently, and to exercise our wits, and to be more industrious in our business, and to do what is just and equall. Go forth then idle companions, and powre on a little hot water wherein lime hath been infused, and believe me not, but you shall drive all Pismires away, and shall infuse more life and spirit into all thy plants. *Origanum*, brimstone, Asa, Nitre, Snails-shells, Lupines, Lazerwort, wilde Cucumbers, Bils-gall, boyl, and cast on, or but in fume or sprinkled: also many things there are ready to be had for one that is diligent and laborious, whereby you may quickly drive out this plague from your grounds, and you may expect a great retribution for your pains, abundance of fruit. Moreover all those things that drive away Wasps and Hornets, that we spake of before, will afford you a sufficient remedy, and will also kill all the Pismires. Yet in truth, thou sluggard, thou hast more need to nourish up this creature and set up for it a statue of gold. For so of old time they are said to have done, when they worshipped the Ant, in an hieroglyphick, holding three ears of corn in the mouth of it, as being an emblem of divine providence, and labour, and of household care. For they are, to use *Aristotles* words, without any King, and under a popular government; yet every one of them is for himself a father of his Countrey, and they do to their power increase the common good as if it were for themselves in particular. But if you object, that the Pismires by biting cause redness, tumour, tickling, and then a grievous pain where they bite; I do not wonder at that; I rather wonder at this, how thou canst look upon them, and not blush extremely, for thou canst not chuse but blush to see such great industry in so small a creature, and to behold the watchfulness, labours, journeys, sweat, and toil that he is busied in. Yet they do not wound idle people so much (whom alone they are said to sting) but it will be cured with an Emplaster of *Varignana*, made of Flies and Pismires mingled together; for as Scorpions, so are they the remedy for the wounds they make; and they bring their cure along with them when they bite. *Pliny*, *Columella*, *Arnoldus*, *Helianus*, *Albertus*, and *Vitalis*, will direct you in other helps, but you must not draw them out and apply them, without using the prudence of the Pismire. Will you give me leave to reckon up the infinite benefits you may receive from them, for this small detriment you accuse them for? Now listen what the Ancients write concerning the virtues of them, and judge uprightly concerning it. For they are not only meat for Serpents, Dragons, Beares, Locusts, Rats, Dormice, Chameleons, Lapwings, Woodpeckers, Larks, Nightingales, Pheasants, Wagtails, Hens, sometimes to satisfie their hunger, sometimes as remedies to cure them of surfets, as *Pliny*, *Solinus*, *Plutarch*, *Palladius*, *Eustathius*, *Bellonius*, *Albertus*, and experience do witness: But also the Inhabitants of the Countrey of *Mangi*, do feed on red Pismires seasoned with Pepper, and they are their greatest dainties as *Nicolaus Venetus* doth testifie. Also they are good to catch Locusts, and to bait for many fishes, chiefly the Roch. As concerning Physick, there are but a few diseases that these creatures, as the hand of God, do not yeeld some help unto. Doth a Feaver burn and scorch thee alive as it were in the Engine of Perillus? hearken, and I shall tell thee of an admirable water to quench that fire, and most effectual against it, as *Gesner* received it from a friend: Take fountain water one pound, honey three spoonfulls, shake them in a can, and set them in an Emmets hill, so that Pismires may easily fall into it; when you find that so many are fallen in as will thicken the water, shake the Can, and as you use to do in making Rose-water, so distill them. The dose is half a spoonfull, or more as the Patient can endure it by reason of his force more or lesse, it will wonderfully provoke vomiting, and will also evacuate the matter of the disease by Urine. *Pliny* is the Author from the old sayes, that a *Quotidian*, *Tertian*, *Quartan*, and all intermitting Fevers will be cured, if the sick cause the parings of his nails to be cast before the entering of the Ant hill, and if he catch the first of them that layes hold of them, and bind him up and tie him about his neck. Art thou troubled with pains in thy ears? go to, fill a glasse with Emmets and Emmets eggs, and stop it well, and bake it in an Oven with

Their Physick
call use.

with the bread, till it be as hot as the bread that begins to heat ; then shall you find a water that is very usefull to cure the pains in the ears if it be dayly dropped in. *Is there a cloud before the fight ?* presse out the juyce of the red Emmets, and drop it in, it doth corrode with some pain, and wholly extirpate it. *Erosus, Trotula, Theophrastus.* Emmets egges beaten and put into the ears, remove all deafness quickly. *Marcellus.* Some bruise them and press out the watry substance, and drop it in. Some infuse them in a glasse vessell in Oyl, and boyl that on the fire, and powre that into the ears.

If Urine be retained and cause the *Dropsie*, drink twenty Pismires, and so many egges with them in white wine, and they shall help you. Also their egges distilled do much when Urine is stopped. *Leo, Faventinus.* A Maid that cares for her beauty, and would make the circles of her eye-lids black, Emmets egges bruised with Flies will perform that, and give them their desire. Some again either through age or disease (to use the Poets phrase) are beaten in their property, and have lost their generative power, that they cannot do the office of a husband if they would. Some Authours commend to these oyl of Sefamum with Emmets egges bruised and set in the sun, if the yard and testicles were anointed with it. To this oyl some add Euphorbium one scruple, Pepper, Rew seed, of each one dram, Mustardseed half a dram, and again they set it in the sun. *Rafis.* *Arnoldus* in this case commends black Ants macerated with oyl of Elder. *Nicolaus* mingleth it with roots of Satyrium ; and others do give the distilled water thereof to those that are fasting. *Gesner* in *Euonymus* describes a water conducting thereunto ; Take saith he, a pot besmeered within side with honey, and half full of Ants, then add long Pepper, Nutmegs, Cardamon, Pellitory of Spain, each one pugil, Butter what may suffice, and digest them fourteen dayes in horse dung, then distill them in a Bath, and give a little duly to be drank fasting. Others, saith *Merula*, add Comfery to oyl of Pismires ; others *Borax*, or root of Masterwort with Wine when the impotent man goes to bed, and thus they affirm that men may be cured of feebleness, and women of barrenness. But I wonder at the force of Pismires in this case, for *Brunfelsius* writes that but four Ants taken in drink will make a man unfit for venery, and abate all his courage thereunto : yet he will maintain that Emmets with common salt and egges, and old hogs grease, wrapt in a cloth and laid on, will cure the pain of the Hip-gowt. *Marcellus* saith, that if they be applyed with a little salt, they are a present remedy for a Tetter : Also as *Serenus* relates, they are good against scabs and itch from an inflammation of blood ;

*The dust in Emmets bills doth deep ly,
Being mingled with oyl, will help it by and by.*

Also *Arnoldus* reckons Emmets egges amongst such things as take off hair ; and commends water distilled from them against *Noli me tangere*, and all corroding Ulcers. *Albertus* thinks that drank with Wine, they do powerfully dissipate winde. Reckon how many Warts you have, and take so many Ants, and bind them up in a thin cloth with a Snail, and bring all to ashes and mingle it with Vinegar. Take off the head of a small Ant, and bruise the body between your fingers, and anoint with it any impostumated tumour, and it will presently sink down. *Nonus.* Also God, that I may omit nothing, by the biting of Ants called *Solipuge* (it is a kind of venomous Ant) drove the *Cynamolgi* (a slothful and idle people of *Aethiopia*) from their habitations, and destroyed them quite. *Pliny.* Some think they should be called *Solifuge*, but *Cicero* calls them *Solipugas*. I have a few things to speak from Authors, as from *Antibologus, Apionius, Natalis Comes* *μυρμηκονμαχαία*, and *Moichea* a witty Book of the same argument. And *Aratus, Herodotus, Strabo, Aristophanes, Rafis, Aggregator, Beroldus, Ryffius, Zetzser, Arnobius*, have by the by run over the natures of them, and their polite life. But because they add but little to what hath been said, I would no longer play the Pismire, lest seeming to be eloquent I might grow impertinent, and searching every creek too narrowly, I should make more gaps. God grant that we whom God hath commanded to learn of Ants, when we are idle and mind nothing but our bellies, may by his good guiding learn of them, and he instructing us, we may perform our duty. It is a small creature, and contemptible for its magnitude, yet we must know that goodness is not in greatness, but what is good is to be accounted great. I have said.

CHAP. XVII.

Of the Glowworm, and the female Melo, and of Anthremus and the field Chislep.

OF-times those that are of a great faction, and of noble descent, will scorn to marry with one of a common family. Yet the Poets write that *Jupiter* did not disdain to embrace ordinary women ; and the Cicindela or Glowworm, and the oyl Beetle or Melo, (though they are of the winged order) are not ashamed to couple with others that want wings. And for as much as these females are endowed with the same force and dignity by nature, which is seen in males, I know not why they should refuse or be weary of their chance, and of their female. When as (if their wings be taken off) they agree in the same endowments of their minds and bodies. We spake abundantly in the first Book, concerning their form, figure, manners, virtues,

virtues, use, when we speak of their males that have wings; and though this Treaty is allotted for Insects without wings, yet I would not artificially separate the females from their males, whereas naturall love hath from the beginning united them together.

I give you here the picture of *Amibrenus*, which the Greeks call *Anthrenus* without wings. Some conjecture that it is a creeping Hornet; others think it is a kind of the Spider *Phalangium*, which *Pliny* saith differs from a Hornet only in want of wings. It hath a crooked nose, and forked, and the face looks upward. It perfectly represents that horned Owl that we saw in the low Countries. It hath black eyes, a breast very hairy and yellow, the feet are yellow at first, then brown; the rest of the body hath 8 junctures that are yellow from red, which is much adorned by black spots on the back; from the top of the nose, sailyards or horns of a yellow colour grow forth; they are all hairy and flexible, yet are they something hard in feeling. He bites so that it is hard to cure it, yet it seems not to be so deadly as the biting of the *Phalangium*, nor is it yet so gentle but that the venom of it exceeds the Hornets. If hereafter I can discover any thing more concerning the nature of this little creature, the conditions and use of it, I shall willingly do it for the publick good; for far be it from me to conceal any thing that may make for the advancement of Learning.

From the similitude this Insect hath with a *Chistep*, we call it the field *Chistep*; for it is found in Corn fields; it differs from the rest only in the number of its feet, (for it hath but six feet that are very small and black) The neck of it is very short, the body something broad and compact, the tail somewhat painted. *Pennius* saw one in *July* about *Colchester*, or else he never saw it. What Physicall use it hath it is yet unknown to us.

CHAP. XVIII.

Of Mineral Worms with six feet.

IN *Pennius* his papers concerning the nature of Wormies, I did for a time wonder at his opinion, when he spake of Wormes in stones, and he averred that he saw little ones with six feet in old rotten stones. For I had received from all Philosophers, that all things that are very bitter, salt, sowre, sharp, oily, hot, cold, solid, hard, though they may corrupt in time, yet they will breed no worms, and therefore *Theophrastus* calls them *azca*, not that they want life, but because they breed no living creatures. I began to weigh the matter narrowly, and to put into an equall ballance, without fraud, all their opinions; at last I found that our Ancesters were here and there most foully deceived, and I ascribe more to mine and *Pennius* his eyes, then to all their words. Tell me in good earnest, is there any thing more bitter then Gall or Agarick, saltier then the Sea, more tart then Leaven, more sowre then Vinegar, more hot then fire, or more pure and cold then Snow congealed? yet certain it is, that Worms breed out of all these: and it shall appear sufficiently by the sequell of the story, that Worms are bred out of stones, neither driftnesse, nor solidity, nor coldness, nor want of heat or moisture can hinder it: Nor will I allow of that, That Nature produceth living creatures by a mixture of heat and moisture, and moisture is alwayes as the matter for heat to make a concoction of. For not only where moisture affords matter, and heat doth manifestly concoct it, are living creatures breed; but there also, (that we may not seem to set bounds to the power of God) where we see with our eyes that there is neither of these, nay where we may conceive that they are both absent. The generation of the creature called *Pyrgonius* in the flames, of *Oripa* in the most frozen snow, will evidently prove this, and that was the cause that I sooner subscribed to the generation of Worms in stones. Moreover, they that with their graving tool, do make rough their Millstones that are grown over smooth by using, find Worms oft-times bred in them, as the Brother of *Pennius* testified. *Felix Platerus*, the worthy President of the Physicians at *Basil* reported to me, that he found a great live Toad in the middle of a hard stone that was saw'd in sunder, that was bred there. And that excellent man *Zuingerus* relates the same thing of a Scorpion. And indeed these things had seemed to me incredible and monstrous, had I not known the same thing to have happened in a Quarry of *William Cave* a Noble man of *Leicester*. And neither Philosophy nor reason is contrary to this opinion, since in the earth, the mother of all things, there is all kind of heat and moisture, and all kind of spirits; and (to use the words of a principall Physician) all things seem almost to be

full of all things. Nor can I see the reason why stones should rather be bred in living Creatures, then living Creatures in stones; and as I shall easily grant that there are Minerall vapours in us, so I shall not fear but I may grant that there are animal spirits in them, and yet not wrong the truth. For they have invisible and secret passages, nervs, veins, and turnings, whereby they either draw to them strange moysture, strange seeds and different vapours, or else receive them being brought thither. Some say, that the marrow of a mans back will produce a most venomous Serpent. *Cardanus* saith that Worms will breed of the ashes of Worms. Many Writers besides *Pliny* report that Scorpions will breed from *Basil* buried between Walls. All men do see that stones are bred in the air: And *Bonus Ferrariensis* is not ashamed to say that it hath rained Calfs, bloud and stones, which things though they sound harsh, and not to be true, yet I dare not rashly deny it, nor doth this at all impair the opinion we hold concerning Worms bred in stones. And if the reason of this seem to ly so deep, that it is too difficult for us to search out; you must think that truth lyeth so deep, and covered with so much darknesse, that it could not be found out till of late years. And in the generations of these things, (which God only knowes) truth will never shew it self but by conjectures, similitudes, collations, proportions, and observations. God doth here seem to scoffe and deride the arrogancy of worthlesse men, that dare look asquint into the work-house of Gods Creation, and are not afraid to inquire into the reasons, and to search and trie, and to attempt to imitate the works of God. I wish we could be admonished either by the punishment of *Salmonus*, or by the counsell of *Solomon*, to learn more modestly: For that is the only way I know to the true knowledge of things, and the safest for us to walk in.

CHAP. XIX.

Of Worms in Vegetables, that have six feet, and first of Worms in trees.

WORMS in Vegetables are either Worms in trees, or in shrubs or Pulse, or Corn, or Herbs. The Tree-worms some of them feed on the wood, some on the bark, some on the leaves, some on the fruit, and of all these we shall speak in order. Those that corrupt or spoyl the wood are of divers sorts, for those that breed in green and growing wood are called *Annas*, those that breed in dry wood without sap, are called *εξυλα*, those that are bred in solid and dry wood are called *Thripes*, those that breed in hotter kindes of wood are called *Termites*, those that breed in saw-dust are called *Cossi*, those that breed in planks of Ships are properly called *Teredines*. *Annas* it may be took their name from *ἀννεν*, for they do bite and eat living trees, so that oft times about their roots a great deal of powder and dust may be seen, as if it came by sawing. This Worm hath an ill-favoured head, of divers colours, covered with a covering, and he can put it forth and draw it in at pleasure. His feet are on the hinder part toward his tayl, as the *Cossi* have theirs on their breast, the rest of the body is covered with a sandy Coat, as it were their shell, and when they put that off they die, as Snails out of their shells.

εξυλαον.

επι.

In that time which Nature hath appointed they grow into a sheath like to an *Aurelia*, but what winged Creature cometh from that afterwards I could never yet observe. This is far greater than *Cossus*, by reason of its unsatiable eating, and is not so dainty. The Wood-peckers and other Birds that spoyl the trees do make holes in the green trees, and by the sound finding out the hollow places, they dig and pierce in there, till they come to those devouring Worms, and they devour them. For they exceedingly delight in this kinde of meat, and for love of it they will sometimes spend whole dayes in digging of a tree. *εξυλαον* is found in rotten and hollow wood, which will make no noise though you strike it with a staffe, it is very like to the *Cerastes* in *Theophrastus*, and the *Pitiocampa* of the Physicians, but that it hath only three feet on both sides. *Gesner* attributes to it a venomous and constant evil smell, and a very corroding faculty. *Thripes* are thought to be named from *terendo* wearing, they are little Worms very frequent and common, their bodies are white, their heads black, or brown from red, with six very slender feet neer their neck, and blackish with a little red, like to the Worm in a Hazel-nut for the fashion of their bodies, but they are shorter and smaller in the middle; they love no black wood, but are bred only in wood that is whitish, (as is the white sap of Timber, Hazel-nut trees, Birch, Cinamon, the Plain-tree) and they penetrate into these when they are partly dry and solid, and drinking up the moysture they have, they make them rotten. I passe over the contests between *Pliny*, *Hesichius*, *Theophrastus*, *Plutarch*, concerning the signification of *Thrips*, whereof some are so negligent, some so curious in observing the properties of words, that in describing them they are very obscure, and as good as nothing. The Ancients used for Seals, the wood the *Thripes* had eaten, and chiefly the *Laconians*, as *Hesichius* testifieth. Whence *Lucian* in *Lexiph.* I keep them under seals eaten by *Thripes*. For these Worms as they eat forward, do engrave divers characters of herbs, and forms of living Creatures, and so exceed the Divine sculpture of *Phidias*, *Praxiteles*, *Myrmecides*, *Bupalus*, *Sophoniscus*, *Anthermus*. *Galen* speaks of a man that made Rings, l. 17. de usu part. who

who on the broad part of a Ring engraved exactly, to a wonderfull demonstration of his art, Phaeton with his Chariot and Horses, cast down headlong. But the Worm *Thrips* hath neither graving tool nor Iron instrument, but with his soft tooth engraves most solid Signets, and frames wonderfull pictures of all things sometimes, only by the conduct of Nature. When woods are dried by overmuch heat of the Sun, they produce and feed a Worm called *Termes*, which as *Servius* saith, being bred out of the very pith, at last consumes its mother, and will not touch the hard baky substance. A very ungratefull little Creature, and so much worse then other Worms, the more it is hurtfull to the heart and vital fountain of trees: For they live sometimes when their bark and hard wood is devoured, but when the pith is wasted they die presently, and Nature can never cure this wound. They are like the

Termes.

Cossi.

Cossi in shape of body, but they are farre lesse, and much softer. The name perchance comes from *Kis* a *Greek* word, as if you should call it a Wood-weevil. For the Philosopher saith that *Kis* is a little Creature bred in wood, like Worms bred in Corn; the *English* call them *Timber-worms*, because they are seldome in any wood but that which is cut, and prepared for building. Their bodies are full of wrinkles, and hence some *Roman* Consuls are called *Cossi*. The greater *Cossi* are almost as thick as the little finger, and as long as three fingers broad, of a whitish colour, almost like to the greater kinde of Caterpillars; wherefore the great ones are called by *Pliny Cossi*. They have three feet on each side that are pendulous, not farre from their heads, short, slender, and black. The body of them hath twelve rings, those toward their tails are alwayes smaller and shining; their heads are somewhat thick, of a dark colour, and the nose is small, forked, sharp as a Spear, black, with two plates in the forehead, neer the mouth there are small hairs that are pointed, all the rings in the sides are severally marked with red points, a little hollow. It is a Creature that creeps very slowly, and the motion can hardly be perceived, wherefore *Festus* calls them *Cossi*, great bellies, and sluggish Creatures. He hath very little eyes, a round back, a belly something hollow, of a waterish whitish colour; they seem to be fat, and very soft; they breed in wood newly cut, but before it ought to be. But if they have been long cut, and have lost much of their moisture, the small *Cossi* only breed in them, that differ from the great ones only in bignesse. The Ancients in *Pontus* and *Phrygia* (as *Pliny* and *Hieronymus* note) fed on these as the most dainty meat, and for that use they fattened them with meal, that they might be fed Worms. *Pliny* saith they serve also in physick; for they heal Ulcers, increase milk, and in Oyntments they cure creeping sores, which *Albertus* also confirms. The *Teredines* have a very great head, considering their bodies, they gnaw with their teeth, and pierce into Okes, as you may know by the noyse: But *Theophrastus* thinks that these are only found in the sea, and men think there is no other Worm can properly be called *Teredo*. We remember, that in the Ships of the *Venetians*, that had long stood in the Havens of *Alexandria*, that little ones were found, that were a cubit long, and as thick as a mans thumb, such as that famous Sir *Francis Drake* another Sea *Neptune* brought home with him, in his Ship that had gone over the world, and was grown rotten and spongy. We saw other *Teredines* an inch long, like to Worms bred in flower; they have a red body, a yellow shining head, a little red, a forked

mouth, from the lips whereof little thorny hairs come forth, they have three feet on each side, the incisions of their backs are eleven, something red: The rest of the body is of a watry yellow, and shines, the greater they are the more darkly they shine, of a Crimson colour, and the lesser they are, the whiter they are. The *Italians* call them *Byssam*, the Spaniards *Bromam*, from the eating of them, for they eat Ships, and penetrate them; whence *Aristophanes* in *Equitibus*, brings in a rotten Galley, speaking thus, *I being eaten by the Teredines am accused for it*. And *Ovid* saith thus, 1. de Ponto. *It's eaten as a rotten Ship with Worms*. By *Pennius* his leave, the *Teredines* eat not only Ships, but beams of houses, so the Scholiast upon *Homer* saith, (*Odyss.* 10.) The words are these. *Melampus* whose ears *Draco* had picked, that he might understand the voices of wilde beasts, was cast into prison for the Oxen of *Iphicus* he had driven away; where when he understood by the speech of the *Teredines*, that there was but little of a main beam left, he cauted himself to be brought forth, lest it should fall and kill him; and whilst he was lifted up by a man and a woman, and got forth, the house fell, and both of them were slayn. That is also apparent out of the chief of the *Latine* Comedians, when he brings in *Philolaches* a young man, speaking to them in these words;

These three
were found in
rotten logs.

I found this in
the root of a
great Mallow,
it feeds on
earth-worms,
biting them
continually,
and sucking
them till they
be dry.

If tempest comes, *Teredo* enters,
And the rain at all adventures,
Gets in, and rots the walls and wood,
Makes work for Carpenters, that's good, &c.

Z z z z 3

These

These hurt especially great trees, as the Oak, the Pear-tree, the Apple-tree, the Chestnut, the Larch, Walnut, Beech, the Medlar, the Elm, and broad leaved Willows: in which cut unreasonably, or planted, a soft and ill fatty humour breeds (which Wood-men call, the sap, and the whire) which is the matter and nourishment of all the Terebrines. Trees that are drier, more bitter, more oily and hard, are thought to be so much the freer from these Worms: yet sometimes they will offer violence to the Cypress-tree, the Walnut, the Guaiacum, the Tiele-tree, and to Ebony it self. The manner of their breeding in wood is thus: Many are bred within, and do not come from without, and they eat up their original, that of what they were bred they may live by the same. The material and conjunct cause is the sweet moisture of wood that is fit for their nourishment, being corrupted, even as of sweet flegm, worms are bred in the belly. Now that sweet humour putrefies from a twofold cause, either by distemper, or solution of continuity. By distemper the quality is corrupted, and by cutting not only the inbred humour runs forth, but some strange humour enters by rain and mists, and corrupts the wood. In old spongy, and dry trees, by reason of age, are the greater Worms, both because the radical moisture is more diminished, and because the distemper, heat and moisture that are strangers, are more augmented: as oft-times old men are troubled with cruel scabs, and eating sores, and Worms. Wood lying open to the Moon in the night, sooner breeds Worms, because of the over much moisture of the air, and in the hotter Sun, from too much heat. Those that breed within, breed at all times, but for those that come from without, and are bred of the seed of Gnats and Flies; the Spring and Summer are the chief times for them; for in Winter they are frozen and dye. Also the climate and the ground are of great force, for the Irish wood seldom corrupts, there is such vertue in the ground, and in *Arabia*, in the climate. Now we shall describe the particulars.

Fig-tree
Worms.

Of those Worms that are in Fig-trees, some are bred of the trees themselves, and another is bred withall, that is called *Cerastes*. For since the greatest part of Worms do differ in shape and form one from another, yet the principal difference amongst them is this, that those which are bred in one kinde of tree or fruit, if they be translated to another kinde, they will not live: yet men affirm that *Cerastes* is bred in the Olive-tree, and will breed in the Fig-tree; wherefore the Fig-tree hath its Worms, and sends forth those also that it receives from other trees: yet they are all like to *Cerastes*, and they make a small shrill sound. *Sypontinus* saith he hath two horns on his head: when he hath eaten the place so hollow that he can well turn himself, he begets another little creature, and changeth one kinde into another as Caterpillers do.

The Service tree is infested with red Worms, and hairy, and then it dyes. Also the Medlar-tree being old produceth such Worms, but they are greater then in other trees, as *Theophrastus* writes. The sap produceth a Worm like to a *Thrips*, from whence Gnats and kindes of *Phaenici* are bred, wilde Pear-tree Worms, some sort of living Creatures that feed on wood, saith *Hesychius*, for they extremely hurt wilde Pear-trees. A little Worm in the Oke-like tree (*Suttonius* calls it *Galbus*) is wonderfull slender, whence the first of the *Sulpitii* was called *Galba*, from his extreme slenderness. The Palm-tree produceth the *Carabus* (as *Hesychius* and *Aristotle* testifie) a Worm like to Sea-lobsters, having only six feet; by this means the *Carabick* Worm of *Hesychius* is known: *Theophrastus* writes that they cut off the small boughs of the Cinamon tree, two fingers length, and when they are green they sow them up in Ox-hides; then they say that these boughs corrupting will breed Worms that eat the wood, and will by no means touch the bark, because it is sharp. This wood was seen in *Pennius* his house, eaten by a Worm that was of an Ash-colour, it was not very hard, but had neither taste nor smell; contrary to that some Portingal Merchants and Quack-salvers that are ignorant of simples affirm. The Worms called *Rance*, breed in the root of the Oak, and hurt it. *Pliny* saith, an Olive-tree is ill planted where an Oake is dug up, for the Worm *Rance* left in the roots of the Oak, creep into the roots of the Olive-tree, and endamage them. *Johannes de Chaul* affirms the same. The Ancients reckon up but few worms that feed on bark, except the *Scolopendra*, *Juli*, and those Moths that are like little Scorpions, whose nature we explained in the Chapter of the Scorpion. The Germans call these *Clops*, they are not much greater than a Flea, of a red colour, with ten feet, they are frequent in the wood and houses of the *Muscovites* built of Pine-tree: in the day they feed on the moisture of the wood that sweats forth between the bark. In the night they creep out, and if they light upon men that are asleep, they will suck out their blood, biting painfully. The Worms called *Syrones* feed on the leaves and flowers of trees, how small they are in thickness we may conjecture from this, that it creeps between the membranes of the thinnest leaf, digging, and not hurting either outward skin. Next to the Worms in vinegar (saith *Joach. Camerarius*) I never saw a Worm so compact. The mines that it makes do sometimes represent the most fine lines and fibres. They hurt exceedingly the leaves of the Cherry-tree, and the Apple-tree that are spotted; and when they are full they fall off; and they seem to be formed of many Pompion-seeds glewed broad waies together, but that they are far smaller. From these when they are dead another small Insect ariseth, as they grew from another. *Ageri*, are like to *Syrones*, which the English, whether they breed in wood, or bark, leaf, or flower, or fruits of trees, as in Cheese or Wax, call *Mites*, that is very little ones, or *Alomes*; they differ from *Syrones* by this, that they seem to be made of many *Acari*. But the *Acarus* it self is a round white six-footed little creature like to a little Lowse, of almost no substance, that if you press it violently between your fingers and your thumb, it is so small that you cannot feel it nor hurt it. *Antigonus* and *Aristotle* call

call it *Jupiters Butler*, it may be because it will eat with its nib into the thickest Wine-cask. And certainly if there were not something of God in it, and of divine vertue, how could we finde to great force in so little and almost no body? Also in the leaves of the Beech, little knots are found wherein there are small Worms. The fruits of trees (as *Theophrastus* saith) are sometimes worm-eaten, when they are yet green, as we see in Services, Medlers, Pears and Apples. The Olive both in the skin and kernel hath Worms called *αἰσχροί*, and it is a mischief not to be neglected (saith *Theophrastus*) for it will not only waste all the oyl and the juice, but will eat up the stones that are so hard wherein the kernel is. Also little Worms are found in Galls that are eaten through, and they are bred in the very inmost pith, out of which afterwards ariseth a kinde of Flies and Gnats, as *Valerandus Doures* an Apothecary of *Lions* testifieth. Moreover, in Oak Acorns, and spongy Apples, sometimes Worms breed, and Astrologers presage that year to be likely to produce a great famine and death. I need not contend that there are Worms in small Nuts, for all men know it: especially when the Summer is moist, and the wind blowes from the South. It is strange that *Ringelbergius* writes, *lib. de experiment.* that these Worms may be fed to be as big as a Serpent, with sheeps milk, yet *Cardanus* confirms the same, and shewes the way to feed them, *Lib. de rer. varietat.* There are little Worms bred in dry Figs like those in Hazel-nuts, with a black head, and the rest of the body is a whitish yellow, but they are smaller. *Bellonius* saith he found that Cedar as well as Pine Apples were subject to Worms. They are for thickness like to the female Glow-worm, a fingers breadth long, with a head like an Emmet, but more compact, with twelve incisens; on each side it hath three feet near to the head, and two circular foreyards, with a thick belly, and a sharp tail. Also in the hard and woody hulls of the Witch-tree, there is a broad seed, and oft-times eaten with Worms: and you shall finde there oft-times their very Aurelia's. Lastly, no fruit can be named, but some Moth or Worm will infest it; even Manna it self sometimes (which the Poets feign to be the meat of the gods, the Scriptures maintain to be the meat of the sons of God) corrupted and bred Worms, when contrary to Gods Word it was laid up till morning.

CHAP. XX.

Of Worms of Fruits, Pulse, Corn, Vines, Herbs.

UPON the lower Willow (especially when swelling galls break forth) sometimes there are found like to roses, that are full of Worms, as it also happens in the leaves of the Mastick-tree. *Quinqueranus* saith there are two kindes of scarlet Oak, one like a great tree, the other a small shrub, about a foot and half high; it spreads very broad, and the leaves are smooth and shining, with a numerous thorny beard in the circumference rising up with many fientes like to the Rose-bush. Our Countreymen call it a Beech-tree, though it be nothing like to a Beech-tree. It growes on plain ground, but that stands high, with little dry hillocks, and unfruitfull: when the shrubs are bedewed with showres in the midst of the Spring, the Cochineal begins thus: When the lower stalk divides into two branches, and in the middle of these there comes forth a thing that is round, and of the colour and bigness of a Pear, they call this the Mother, because from this the other grains proceed. Besides every one of these shrubs hath commonly five Mothers, which at the beginning of Summer and in hot weather put forth a great company of little Worms, and they cleave in the top. A new off-spring of shoots growes up severally on high of a white colour, that produce living creatures. But wheresoever they meet with the hollow places of the twig budding where the Worms are, they fall down, and become as great as Millet-seed. Then growing up more freely, the white colour changeth into ash-colour, and then they appeare no more living creatures, but again like unto Pease. Then those grains being ripe gathered, now great with colour'd Worms: whilst they are carried to the Merchants, the thin skin that goes about them breaks. The price of a pound of these Worms that are come forth of the skin is a gold noble; but that part which is yet in the skin, is sold for a fourth part of it: the mean while the little Worms are as if they were dead, and move not. But when the season of the year comes, they are hastned by putting them in linnen cloths, and exposing them to the Sun. Then but feeling the heat, they presently creep forth, and strive to fly away; but by the keeper of them, who watcheth them continually, they are shaken back into the middle of the linnen cloth till they die; whilst this is doing, and for three daies after, there is so sweet a smell and delightful, that no Civet, Musk, or Amber-greece, nor yet Lemon flowers can surpass it.

But if any grains escape from him that gathers them, they presently send forth a numerous army of winged creatures into the air.

It was observed one year, that in a stony field in the Countrey by *Arles*, the profit of this increase was reckoned at 11000 crowns. So writes *Quinqueranus*. And *Carolus Clusius* saith, that in his time, the same fashion of gathering Cochineal was observ'd about *Narbon* in *France*, and also in *Spain*. For they have plats of ground in the open air provided for the purpose, with the sides something high, and they lay a linnen cloth upon them and pour forth the Cochineal upon that; the keepers stand ready about it with little wands continually when the Sun shines very hot, and they strike

strike the outides of the linnen cloth, that they may drive back into the middle of the cloth these little Worms that hasten to come forth. But *Petrus Bellonius* l. 1. observ. c. 17. tells us of another manner of preparing Cochineal.

There is (saith he) in *Crete* a great increase of Cochineal: shepherds and boyes do gather it. They finde it in *June* upon a small shrub, of a kinde of holm that bears Acorns sticking to the stock of that shrub, without any stalk, and the colour is ash-colour with white, but because the leaves of that shrub are full of prickles like to Holly, the Shepherds have a staffe in their left hands to press down the boughs, and hold them so; and in their right hands they have a pruning knife, wherewith the cut off the smal boughs, from which they pull off little round bladders as great as smal pease, on that side they grew to the wood they are chapt and open, full of little red creatures smaller than nits, that fly forth at that cleft, and leave the bladder empty. The boyes when they have gathered their Cochineal, bring it to the Treasurer, and he gives them victuals for it. He parts these little creatures from the bladders with a sieve, and then he takes them gently with the tops of his fingers, and makes bals of them as great as Hens eggs: for should he press them too hard, they would turn to juice, and the colour be lost: wherefore there are two kinds of dying stuffe, one of the pulp, another of the bladders, and because the pulp is more usefull for dying, the price of that is four times beyond the price of the bladders. *Gesner* also saw small Worms of a yellow and red, upon the uppermost boughs of the Juniper-tree; in the sponge of the Eglantine or wilde Rose, white worms breed, from which *Aristotle* saith that Cantharides do come. *Gesner* saith, that after two moneths the sponge being kept in a stove will send forth a great number of little live Worms. Also the Thorn and the Bramble, the Rose, Heath, Broom, tree Trifoly, Raspis, the Myrtle-tree, Capers, Bush, the Goosberry-bush, the Palm-tree, the white Thorn, the Privet, Park-leaves, Licorice, and indeed every shrub, and under-shrub is eaten by Worms: nor could *Palma Christi* (which afforded shadow to *Jonas*, that divine Prophet, when he was very hot) escape this plague, as we finde it written. Also Pulle, the gifts of *Ceres*, are (to use the Philosophers word) most Worm-eaten, but how that comes to pass is most uncertain: whether is it, as *Theophrastus* seems to say, when the juice cannot be diffused by reason of the great heat, and the foulness of them? or should we rather say, that the dry part desires the humour, but the humour flees from it as its contrary? So we see drops hanging on a dry wall: or whether the over great heat corrupts both the natural heat and moisture contained within? That corruption comes that way, most sickly *Ethiopia* can testifie. A little worm eats Beans, *Theophrastus* calls it *Midas*, and *Hesychius* *τρίπυρος*, *τρίπυρος*, and *κνυμάλπυρος*, is a worm breeding in Pulse, but chiefly in Pease, and hath its name from eating: and such a one breeds in chich Peason, after that the saltness of it is washed away with showrs, as besides the Scholiast upon *Hesiod*, *Phavorinus*, and *Theophrastus* determine. They often breed in the sweeter Pulse, both by reason of the fitness of the nourishment, and the nature of the air fit to breed worms, and when they are bred they nourish them, and shew them forth. Worms bred in corn are generally called *Saenuses*, which feed on the roots, stalks, reeds, and prickles of winter Wheat, Panick, Oats, Rice, Miller, Rie; others there are that feed upon Wheat-flour, as those that are called *Farinarii*; others of that which is whole Wheat, not yet ground in a mill, as Weevils. The English call the *Farinarii* Meal-worms; they are like to ships worms, they have six feet, with a little shining red head, a round body, and divers coloured as the meal is: for the best and whitest meal breeds them white, the elder meal breeds them yellow, the lean meal full of bran hath dark colour'd. *Cardan* calls them Meal-moths, (but as it falls out frequently) not well considering of it. Those that

are fed with bran, it is wonderful how great they will grow, and from ten in a short time you shall finde three hundred. They are found amongst woollen weavers at all times almost; for they make a mixture of Bran, Vinegar, and Hogs grease, from whence they breed abundantly. The Weevil is the bane of whole Wheat, be it raw or torrefied (as in *Burn* of *Actius* (which the English call *Mault*, the mother of Ale.) For so my Comedian hath it, though *Virgil* and *Varro* call it *Gurgulio* or *Curgulio*. The English call the Wheat-worm *Kis*, *Pope*, *Bowdes*, *Weevils*, and *Wibils*, as if you should say double Bill, yet it is indeed a living creature with three beaks. It destroyes wheat chiefly, yet it will destroy any other grain, leaving nothing but the hull, and the thin skin. For as *Virgil* hath it in his *Georgicks*:

The Weevil spoils a mighty heap of corn.

It is formed like a small Beetle, it hath a beak proper to it self, and with three forks. Some of them are with black bodies, others with brown, but others that are the greater are greenish, and the middle of their body very small. This creature is so dry, that with the least touch it will turn to dust. It is bred chiefly in the Spring, some few daies before that Bees swarm. *Theophrastus* saith they breed of one part of the grain, and the other part they feed on. Our Countrey-men finde by experience that this wheat-worm will lay eggs in chinks of wals, and under the tyles, and from thence by procreation comes a new off-spring. They speak of three wonders concerning these little creatures. First, that though they be but few at first, yet in a short time they will increase infinitely. Secondly, that they will lie between the tyles and in chinks of wals without any meat at least three years. Thirdly, that if they be put into water three daies with

with Wheat or Barly, when they are taken forth they wil live again. Our Countreyman *Siliardus* (a diligent observer of Nature) describes the propagation of Weevils thus: when Ants have eaten off the top of the ear of wheat, the Weevill goes up, and in that little hole he laies one or two eggs (but seldom three) so great as a grain of Muller, long and yellow, full of liquid yellow matter; from this afterwards proceedeth another Weevill. This little Insect hath both sexes, for they copulate before they do this mischief. *Petrus Comestor* affirms that they proceed from Beans corrupted, to whom no man but *Guillerinus de Conchis* assents, lest they should falsly confound a Weevil with *Midas*, or Bean-worm. Beside this Weevil commonly known, *Joach. Camerarius* sent two others to *Pennius* out of the barns of Germany, with a far greater belly; one of them was a kinde of ash-colour, and the other green. Also *Scaliger* saith there is in wheat a worm without a becke, which perhaps *Pliny* meant by his corn-beetle. To this I will refer a certain little creature that is frequent in barns, that creeps with six feet, and with two short fail-yards it tries its way, it is spotted on the middle of its back and sides, and the rest of the body is black, which I therefore call the spotted Weevil. This creature doth no great harm to corn, because it is still alone, and seldom two of them are found in one barn. About *Lentzbourg*, a Town of Germany, a certain insect is found in the fields, which some call *Ulpus*, some *Korn-worm*, others *Kornevele*. It is said to be so venomous and hurtful, that the Husbandmen will leave their plough when they meet it, and run after it to kill it. It is black from a little red, dwelling amongst wheat and eating up the corn: worms bred in Vines, the skarlet Oak worms are like them, such as *Brassavolus* doth strongly maintain and think that they are bred on the roots of Pimpernel. Amongst herbs, both for physick, and for meat, the Violet, Radish, Rue, Basil, and many more are molested with worms. The worms in Violets are very small and black, and run very fast, as *Jacobus Garetus* a most diligent Apothecary, and very famous in the knowledge of simples as there are not many, affirms, out of the root of the Hartichok a worm comes, that hath six feet, like to a Caterpillar, and whitish, with a reddish black head; where it bites the roots of Hartichocks it makes them black, and at last kills them. The Radish produceth the like. *Cardan* saith, men report that there is a worm found in the leaves of Rue, and it will grow wonderful great, as the Hazel-nut worm will do if it be fed with sheeps milk. A little worm that is the childe of the dew, and a guest in basil with a body almost upright, he sticks fast by his hinder feet, whilest he takes hold with his forefeet. Sugar is made of the Sugar cane, the sweetest of all Salts, and as the common sort of Physicians suppose, it is altogether free from corruption. Yet under the authority of *Scaliger*, I assert that a little worm is bred in Sugar, long, black as a flea, and (if you take away his becke) like to a Weevil; and therefore we may justly call it a Sugar-worm. *Bellonius* also makes mention of this. But that Insect which the Germans call *Mayen Wormlen*, seems to breed very seldom, saith *Camerarius*. For in the moneth of May dewes often fall that are very unhealthful, and if they fall upon the leaves of Hops, they turn to little living creatures called *Hoppen*. Amongst thousands of these you shall sometimes see one far greater than the rest (though it is scarce greater than a fat lowse) it hath yellow circles about the belly, the back is chamfer'd, the tail is somewhat long, the colour of the body for the greatest part is blackish. This when it wants aliment from dew, devours one by one all of his own kinde, ever beginning with that is next to him: he changeth his skin like to Silk-worms: lastly, when he is almost transparent, he putting off his last skin, he hangs by his head and feet by a kinde of thin bird-line, by some leaf, and so he dies: why may we not call this worm the Hop-worm? In the stalk of the Asphodil, a worm is bred of a clear colour when the herb begins to flower, out of his shoulders wings grow by degrees, and then when he can fly, he forsakes his habitation. In the swollen joynts of the codded Asmart, and the wilde Thistle, little white worms breed, as yellow ones do in the purple flowers of the bastard wilde Chervil, and red ones in the root of Pimpernel. I often have seen in the female Smalage downy worms; in Mushrooms and Coleworts, small black worms; in the root of Acorus, white ones: in the root of Elecampane whilest it is green and growing, white worms breed in ten or eleven joynts that are visible, that are as thick as a Gooquill, with a lit-black head, and six short feet, and the body all black. The Kings of the Indians, as *Ælian* testifieth, use to eat for their second course, a worm found in a certain plant, when it is roasted at the fire, and they commend it for the daintiest and sweetest meat. In the head or stalk of the Fullers Teasil, we have seen a worm very small, with a little head, and six black feet, with ten or eleven incisions. First it eats up the spongy pith of the stalk, and when that fails it dies for want of food. It is easily found at the beginning of *October*, though *Marcellus* upon *Dioscorides*, doth most shamefully deny it. If I am not deceived, this is that worm the Ancients call *Tatinum*. *Xenocrates* calls a plant like to double Camomel *Galedragon*, (saith *Pliny*) it hath a stalk like Fennel Gigant, with a tall and prickly head, and like to an egg in form: in this with age they say little worms breed, that are good against the tooth-ach.

In the roots of white Thistle (which plant is luxuriant in the high mountains of *Savoy*) there is a little worm found, breeding in some, in others it growes great, and in most of them it grows to have wings and ready to fly, it is white, and hath some joynts that it is divided by, and very black, shining eyes. It may be there is great use in physick of a little worm bred in wilde Tansey: but I leave the enquiry of that to those that are curious in the secrets of Nature.

CHAP. XXI.

Concerning the use of Worms that breed in Minerals and Vegetables,
and the way to destroy them.

Some think that worms that are bred in stones, (whereof we speak) those I mean that are as great as Hand-worms, beaten into powder with the stone, are good to cure Ulcers. Also *Marcellus* witnesseth that these bruised and given with three Cyathi of water, will break and drive forth the Stone by urine. The Ancients used the more solid wood that the *Thripes* had carved with their teeth for Seals, and Antiquity ascribeth the invention of that to *Heracles*. In old trees red worms breed, whereof *Serenus* writes thus.

*From an old tree do but red worms procure,
Bruise them with Oyle, and dropt in warm, be sure,
For pains oth' ears this is the safest cure.*

Galen out of *Apollonius* subscribes this remedy. Worms that breed in hollow and rotten trees heal secret Ulcers and all symptomes of Ulcers, and diseases of the head; also being burnt and powdered with their weight of dry Dill, they cure Cankers, *Marcellus*. But *Aetius* adds three Worms bred of wood to an Oyntment against the *Elephantiasis*, which he learned of a certain Physitian that took his oath of secrecy. The rottenness that is made by their biting dries without pain, and is profitable for many things. *Galen* *Enpor.* 3. c. 7. commends this kinde of powder, against knobs, clifts, and sores of the Fundament. Take Orpiment in pieces three ounces, rotten wood of an Oke four ounces, make a fine powder, then foment the place affected, first with the warm urine of a young boy, and afterwards strew on this powder. But the *Cossi* are not only food for the Inhabitants of *Pontus* and *Phrygia*, and they delight much in them (as Worms in Cheese are to the *Germans*) but they also cure Ulcers, increase milk, and as *Pliny* saith, when they are burnt to ashes they cure creeping sores. The Worm in Fullers Teazil put into a hollow tooth, will give wonderfull ease. *Pliny*. And if it be hanged in a bladder about the neck and arms, it will cure *Quartane* Agues. *Dioscorides*. One *Samuel Quic-bergius* a learned young man, in an Epistle he writ to *D. Gesner*, hath these words, Saith he, as I was gathering of Simples, a certain old man came unto me whilst I sought for a little Worm in the head of the Fuller's Teazill, and he said unto me, O thou happy young man, if thou didst but certainly know the secret vertues of that little Worm, which are many and great. And when I intreated him, that he would acquaint me with them, he held his peace, and by no intreaty could I obtain it of him. *Pliny* asserts that the Colewort Caterpillars being but touched with it will fall and die. The Worms of *Galedracon* (which plant some men confound with Fullers Teazil) being put into a box, and bound with bread to the arm on that side the tooth akes, will wonderfully remove the pain, saith *Xenocrates*. The Worms of the Eglantine will cause sleep, and therefore some *Germans* call them *Schlafoirs*: They are applyed alive to a Felon (but alwayes their number must be odde) and they do certainly cure it saith *Quic-bergius*. A little Worm found in the herb *Carduus*, bound up in a piece of Skarlet and hang'd about the neck, will cure the tooth-ache. *Marcellus*. The Worms that are found in the root of Pimpernel, make a most incomparable purple colour, (*Gesner*) that I wonder the Ancients said nothing of them. All little Worms found in prickly herbs, if any meat stick in the narrow passage of the throat of children, will presently help them. *Pliny*. Rub a faulty tooth with the Worms in Coleworts, and it will in a few dayes fall forth it self. Meal-worms are good and seem to be bred to catch black-heads, and Nightingales, and to feed them; nor is there in winter wholesomer meat for them: for they purge, heat, and nourish also, those Birds that have but a thin nutriment to preserve them. I spake before of the profitableness of the Cochineel Worms. *Brassavolus* affirms the same of Vine-worms, but how rightly let others judge; but they are not only good for dying, but necessary in Physick, for they both binde and dry, and scowr without biting, and incarnate also, they cure rheumatick eyes, mingled with Pigeons blond, they help suffusions of the eyes, they cure Dysenteries, they help hard labour in Childe-birth, and debility, they cure Melancholy, fear, Epilepsies, they provoke urine and the terms, they heat the Matrix, they dissolve water and choler, they abate the panting of the heart, and upon that score they are put into Confection of *Alkermes*, and are the Basis thereof. *Dioscor.* *Avicen.* *Kiranides*. I say nothing, how greedily Sparrows, Wood-peckers, Hens, Wood-cocks, Snipes, the *Pardus*, a Black-bird, Larks, Gnat-snappers, Reed-sparrows, and many other birds, that are good physick, or else meat for us, do feed on the Worms of trees and herbs. Now since God hath mingled conveniences and inconveniences together, both to rouse up our providentiall pudence, and to punish us with punishments due to our sins, how both of these may be prevented I shall shew briefly. *Jonas* being cherished under the shadow of the Gourd, he thought it safe and happy to be so, when the heat was so vehement. But God sent

a worm and took that from him, both to try his patience, and demonstrate his frailty. There was an Arch-bishop of *Yorke*, whose surname was *Grey*, as our Histories relate, when he had abundance of all Corn in the time of great scarcity, yet he refused to let the poor have victuals either for money or intreaty. A little after this his barns that were full of Corn, were so exhausted with Weevils, that they left not one whole grain of Wheat or Barley: Even as *Solomon* said, *He that hoards up his Corn the people shall curse him, but blessing shall be on the head of him that selleth it.* So God, that he may call forth a sluggish father of a family, sends the Moths and Worms into his Orchards and fields, both to make him laborious by this means, and also to teach him to make use of such helps and means that God offers to him. Our Ancestors have delivered by tradition many of these: But because *Cato*, *Vitruvius*, *Pliny*, *Palladius*, *Theophrastus*, *Columella*, *Varro*, *Virgil*, and many of those that were Princes in husbandry, have abundantly set down these things, we shall only give you a smack of them here, because others have given a full draught. That trees may not be eaten with worms, plant them in the new of the Moon, and cut them down between the new and old Moon in the conjunction. Also anoynt them with Tarre, and often wet them with the lees of Oyl. Also keep them under Covert, every where, that they may not stand exposed either to great heat of the sun or tempests of weather. Also that trees may not grow worm-eaten, anoynt their roots before the first planting of them, and then afterwards moisten their roots with mans urine and a third part of the strongest vinegar. Some steep a long while Squills with Lupins, and they sprinkle the places that are worm-eaten or presse out their liquor with a Sponge, or they besmear the stock of the tree till it be very wet, and they powr into the holes Bitumen mingled with Oyl. Others sprinkle on quick-lime, others Oyl-lees and old pisse, others Hogs or Dogs dung steeped in Asses pisse, the roots being first uncovered. *Democritus* taught men to bruise *Terra Lemnia* with water, (it may be he meant Carpenters red) and to smear them with that: Some pick out the Worm with a brasse pin and put Cow-dung over the hole. Red hairy Worms search to the inward pith, if you can draw these forth and not break them, and burn them hard by, it is reported that all the rest will dy with it. It is good also to powr often upon the roots, Bulls gall, and lees of Oyl: To plant Squills, Rue, Worm-wood hard by, to make a menstruous woman passe over the place often, to smear the pruning knives with Oyl of *Cantharides*, and to avoid lean and dry ground. By these remedies Oranges, Peaches, Pomegranates, Quinces, Pears, Apples, Olives, and Okes, and other trees are kept sound a long time, and almost free from Worms. Ashes laid to fig-trees, drive away Worms, for it hath the force of salt, though not so strong. The seeds of Fig-trees or kernels will not be eaten by Worms, if a slip of the Mastick tree or Turpentine tree be set by them. As for Vines, *Actius* bids us to sprinkle Sea-cole with water, and cast upon the place in the Spring-time, and then to smear the roots of the Vines that begin to bud. For if you smear the pruning knife with Goats suet or Frogs bloud, or do but anoynt the Whet-stone with it, worms will not breed there. *Africanus* saith that the tears of the Vine mingled with the ashes of the Vine-stalks, and put on the root with Wine, it will do as much. Lastly they are killed with a fume of Oxe-dung, Harts-horn, Goats-clawes, Lilly-roots, shavings of Ivory, womens hair. The herb *Pionie* or *Thorow-wax*, planted where Vines grow, drive away worms. Some there are that boyl *Assa ferida*, and *Lazerwort* in Oyl, and anoynt the stocks of Vines with it (beginning at the root) or with Garlick bruised. The seeds that must be sowed, should be kept in a Tortoise-shell, or Mints are to be sowed amongst Pot-herbs, but chiefly Tares. The bruised leaves of the Cypresse-tree mingled with them, will avail much. *Aggregator*. And *Palladius* saith that all seeds will be free from worms, if a little before you sow them you soke them in the juice of wilde Cucumbers. *Pliny* bids to prepare seeds of Lupins before you sow them, in the smoke or some hot place, because in a moist place the worms will eat up the middle of it, and make it barren. *Varro* saith that worms will never touch Onyons that are set with salt and Vinegar. Moreover, the seeds of all pot-herbs wet with the juice of Housleek, will admit of no worms. Against Weevils, that are a certain plague to Corn, it is good to dawb the walls with lime and hair both within and without. Others do for two dayes steep the fruit and leaves of wilde Cucumbers in lime water, and with sand they mould it up like plaister, and with that they plaister the insides of their Granaries; though *Pliny* writes that Quick-lime is a very great enemy to Corn. Some put beasts pisse to the lime, some worm-wood, juice of great Housleek, and hops, others powr on the ground Oyl-lees, Herring pickle, and the decoction of Flea-bane. *Strabo* mingles Marle. Others report that often fanning of wheat keeps it safe from weevils; but *Columella* denies this to be true. *Cato lib. de re rustica*, commends Clay mingled with Oyl-lees, and he would have the Granary to be fenced with that, *Varro* useth it almost the very same way, but he commends Clay with Oyl-lees, Maple tree and Corn mingled together. Our *English* men do deceive and destroy them divers wayes. Some in the middle of the heap of Corn do so place brasse Vessels half full of hot water, that the Corn may lie almost up to the mouth brims of the Vessels; for thus they think the weevils are taken or destroyed.

Some shut up an Ant-hill and Ants together in a bag, and after that they powr it forth in a corner of the granary: thus in ten daies will the Ants destroy all the Weevils, and when they are killed, they take them and carry them forth, that are going back to their former house. Also they use to put into that place young Chickens that will soon eat

up all the weevils. Some sprinkle on salt water where Garlick hath been infused, or Hops, Elder-leaves, worm-wood, Rue, Nigella seed, wilde Mints, Walnut leaves, Savoury, Lavender, Southern-wood, Flea-wort, Bean Trifoly, boyld in Vinegar of Squills. They are much delighted with Navew seeds, for the sweetnesse of them, that they will leave the Corn for that, and eat till they swell and break in sunder. Though some may think these things too much, and beside my purpose, yet *Hippocrates* proves that they are fit for Philosophers and Physitians (*Epistola ad Cratevam*) not only to know the art, to describe, gather, lay up, and use Simples, but also in preserving them, and preparing them, and to purge them from inbred or inflicted venome, and from putrefaction and worms.

CHAP. XXII.

Of the six footed Worms of living Creatures, and first of Lice in men.

A Lowse.

The Name.

Description of
their differen-
ces.

Since God hath given the principality to man amongst living Creatures, we will begin with him. In the first beginning whilest man was in his innocency, and free from wickednesse, he was subject to no corruption and filth, but when he was seduced by the wickednesse of that great and cunning deceiver, and proudly affected to know as much as God knew, God humbled him with divers diseases, and divers sorts of Worms, with Lice, Hand-worms, Belly-worms, others call *Termites*, small Nits, and *Acares*: *Acastus*, *Alcmaon*, *Phericides*, *Pharaoh* King of Egypt, *Cassander* son of *Antipater*, *Democratius*, *Calisthenes*, *Olynthius*, *Scylla* the Dictator, and that river of Eloquence *Herod*, knew it to be true that I write, who perishing with a Lowse disease, used Physicks and Baths in vain, for they died miserably of them. Some also write that *Plato* (being elevated perhaps more then he ought, and so wise that he disdained others) died of this disease, whence grew the Proverb, *Platoes Lice*. I shall say nothing of *Henry* the second a most cruel Tyrant, and *Theodorus* that propagated *Arianisme*, two Kings of the *Vandals*: I let passe *Arnulphus* an Emperour, and an effeminate *Sodomite*, and *Cesar Maximus* a filthy Pander, all consumed with Lice, who found that when God commands, the least and most contemptible Creature hath force enough to destroy sinners, and with *Pharaoh* they were compelled to acknowledge this to be the finger of God.

The *Hebrewes* call a Lowse *Kifim*, and *Chinnam*, the *Greeks* *pediculus*, *βεδύλλης*, *βήρυς*, *βήρυς*, *βήρυς*, *βήρυς*, the *Italians* *Pidocchio*, the *Spaniards* *Piccin*, the *French* *Pou*, the *Germans* *Luss*, the *English* *Lowse*. The *Latines* call it *Pes*, as we read in *Plantus in Curcul*. Wherefore you are a kinde of Lions, and like Flies, Gnats, Lice and Fleas, you trouble all men, and are hated by all, but never do any good. And *Livy* to *Gladiolus*, Are they Fleas, Wood-lice, or Lice? Answer me. And *Lucilius* when he sees me, he scratcheth his head, and picks Lice. *Festus*. Where still a Lowse is called *Pes*. It is a beastly Creature, and known better in Innes and Armies then it is wellcome. The profit it bringeth, *Achilles* sheweth, *Iliad* 1. in these words: *I make no more of him then I doe of a Lowse*; as we have an English Proverb of a poor man, *He is not worth a Lowse*. The Lice that trouble men are either tame or wilde ones, those the *English* call *Lice*, and these *Crab-lice*; the North *English* call them *Pert-lice*, that is a petulant Lowse, comprehending both kindes, it is a certain sign of misery, and is sometimes the inevitable scourge of God. The tame ones that breed of corrupt blood, are lesse, and reddish, from Fleame white, from melancholy and adust humours, black, and from mixt humours they are of divers colours, as *Petrus Gregorius* noted l. 33. If you rub them gently between your fingers you shall see them four-square, and something harder than Fleas, whence in the dark when you take them you may easily finde the difference. They that breed in the head are bigger, longer, blacker and swifter, those that breed in the body are fatter, bigger bellies, flower, darkish white, and marked with blackish streaks. Some constantly affirm, that in May they have seen Lice with wings, and that the Locust-eaters of *Lybia*, when they have fed too plentifully of them, after they come to be forty years old, will die with these Lice, as *Diodorus Siculus* saith confidently, 4. *Antiquitat*. *Agatharcides* speaks of these Lice, but he saith they are like to Ticks. They chiefly fasten on the chin, eye-browes, and the privities full of hair, the groin, and the arm-pits, their body is more compact, their nib is sharper, they bite more, and tickle lesse. For Tykes will sometime enter deep into the skin with their nose, that you can hardly pull them out but with the losse of their heads, and they seldome wander, but they bite cruelly, and make themselves a hollow place, and there they stand fast. Some call these Lice in *Latines* *Cicci*, some mens Tikes, others Vultures lice: *Aristotle* calls them wilde Lice, *Hist. Animal.* l. 5. c. 31. it is harder then a tame Lowse, and is more hardly removed from the place it bites. Our *French* men, saith *Fouberius*, call them *Morpions*, and *Patte*, the *Germans* call them *Fenltz leust*, *Gordonius Pessolatus*: they stick very fast to the skin, or bite through the cuticula; they are of a dryer matter, and that which is half roasted,

so they are not so swolne, but they are more compact. The *Arabians* call them *Alcarad*, *Guardam*, *Faed*, and with an Article, *Alguardam*, and *Alfaed*, as *Ingrassias* observed. Also in the *Synonyma* contr. *Rhasis*, they are called *Motes* and *Immores*. The *Italians* call these *Piatolos*, and *Chacillos*, and *Albenzoar Platulas*. All Lice breed from humours, flesh, fat, sweat corrupted, and differ exceedingly in respect of the place and humour. For those that breed of mans blood will die if you smeare them with the blood of other Creatures. Also they that breed in a mans head will hardly live, or not long in his body. So the wilde Lice bred in the privities will die in the head. Those that breed of flesh putrefied, such as often will abound in Ulcers ill cured, will not be fed with the excrements of the skin, (saith *Hieron. Mercurialis*, l. 1. c. 7. de morb. cut.) The opinions of Authors are divers concerning the generation of this disease: *Aristotle* 5. hist. anim. c. 31. thinks that Lice breed of flesh corrupted, in which place he affirms three things. First, that they that breed Lice, have some pulses arising before in their skin, which if a man prick, the Lice will appear. Then that this disease come not, but by moist humours, or to such that have been troubled with a long and moist disease. Lastly, that all Birds, Fish, Four-footed beasts, are molested with this disease, except an Asse. The first opinion pleaseth me not: First because in the skin of the head Lice breed most commonly, where there is the least portion of flesh. And again, if they should breed only of corrupt flesh, the heads of young children that are almost allwayes full of them would be so wanting of flesh, that it would almost waite all away. Further, in Consumptions, where the body nourisheth not, and is wholly consumed almost, they abound most commonly, where all the flesh is so dry, that there is no moisture almost to breed Lice. *Theophrastus* is of another minde from *Aristotle*, affirming that Lice breed of corrupt putrefied blood; which *Hieron. Mercurialis* in the quoted place labours to infringe by these reasons. First because in Feavers that grow from putrefaction of blood, there is seen no such increase of Lice. Secondly, if they should be made from blood, some of them at least would be of a red sanguine colour, and testifie from whence they were bred, as other things doe, but we see no such, therefore, &c. In which place this otherwise very learned man, seems to beg his principle. For in the heads of our children we oftentimes finde very red Lice, and in those that are upon recovery of a putrid Synochus, we finde that oftentimes many red and mingled coloured Lice breed. *Galen*, 1. de comp. med. sec. loc. c. 7. and *Avicenna* l. 4. sen. 7. tract. 5. c. 26. ascribe them to some other cause, and as *Mercurialis* thinks, that their opinion is the truest of all, namely, that they breed from the hot excrements of the second and third concoction putrefied, nor sharp, nor bad. To understand rightly their opinion, we must know, that when blood is changed into the substance of the Limbs, many kindes of excrements are produced, whereof some are dissolved by insensible transpiration, others by sweat, others turn to filth, others stay in the skin: Those that are retained in the upper skin, make dandruf, if they stay in the depth of the skin, or are bad and sharp, they cause sore heads. But since I have observed that in some that were in a Consumption incurable, where the sharpnesse of the humour eats up the very roots of the hairs, Lice come forth abundantly, why may I not think by their leave that they may breed at first from sharp humours? *Scaliger* would prove that Lice breed not from putrid humours, because herbs grow from the seed without putrefaction: for he thinks the principle is altered, but he beleeveth not it can be corrupted. But by his leave I must say that *Scaliger* or the Apostle must be mistaken: For so *St. Paul*, 1 Cor. 15. That which thou sowest is not quickened unlesse it die. But if death be a corruption, as the Philosophers say, then *Scaliger* was deceived, and (yet keeping the Laws of friendship) we may deservedly reject his opinion. And Epithymum breeds from Thyme, and Mistletoe ariseth from some trees, that are sound, and not yet corrupted. But I answer, that a Lowse differs more from the principle it proceeds from, than Epithymum doth from Thyme, trees from Mistletoe. For these are of the same kinde, and are as it were thrust forth from the abundance of fruitfull matter, and Mistletoe is nourished from the pith of the tree. But it is apparent, that Lice seldom breed in sound bodies, or not at all, but those that are cachectically, in Consumptions, and full of putrefaction, and watry blood, and whose flesh and skin are corrupt as well as their blood, and fat, are troubled with them. Oftentimes sound men sweat, and yet breed no Lice, for they will not breed of all sweat, but from corrupt sweat, and that which is not bitter. But when it grows bitter, (as we finde it in those that are dying, or troubled with the Jaundies) they forsake their stations and creep from the body into the pillowes that are under them; yet they do not alwayes go to other places when men are dead, for as those that take care of the dead Corpses affirm, they will still stick about the mouth of the stomach, and under the chin by the sharp artery; which places which are most full of native heat, when they once creep unto, it is no small sign of death approaching. Also the complexion serves much to breed Lice, the Countrey, and the dressing. For some have more, some fewer, and some in any Climate will be free from them. *Ovidius* 1. Navig. c. 82. writes, that Christians in the West-Indies have not so much as a Lowse in their heads, and yet the Inhabitants (to use *Plantus* his phrase) are very Lowly, *pedicofi*. Also our Countrey-men have observed, that have passed upon the Indian sea, when they have left the Isle of Azores behinde them, all the Lice presently die, and when they see those Islands again, they will revive abundantly. I think the reason is, (that I may here help *Pennius* out) the extreme heat between the Tropicks, that not only sucks aliment from them, but the Element also. *Vesputius* testifieth of the Isle

Causes of a
general lowse
disease.

L. de Plant. c. 2.

of St. Thomas, that the Blackmoors there are full of Lice, but the white men are free of that trouble. As for dressing the body: all Ireland is noted for this, that it swarms almost with Lice. But that this proceeds from the beastliness of the people, and want of cleanly women to wash them is manifest, because the English that are more careful to dress themselves, changing & washing their shirts often, having inhabited so long in Ireland, have escaped that plague. Hence it is that Armies and Prisons are so full of Lice, the sweat being corrupted by wearing alwaies the same cloathes, and from thence ariseth matter for their original by the mediation of heat. So those that keep no diet, but delight in eating and filthines, and feed on *Vipers, Radishes, Basil, Figs, Lignum Aloes, Garden Smalage, and Dates* too much, their bodies will from putrefaction of humours breed Lice between their skin, as *Diodorus in Empiricus, Simon Sethi, Aetius, and Pliny* affirm. But *Dioscorides* saith it is exceeding false, that Lice will grow from eating *Vipers*. Sheeps-wool that a Wolf hath killed will breed Lice, if a garment made thereof be wet with sweat, which grant that it be an invention of *Aristotle and Pliny*, yet experience teacheth us, that cloathes smeared with Horses grease, will breed Lice presently. *Alian* saith that he will be full of Lice, who is anointed with oyl wherein a *Stellio* is drowned.

Prevention
and Cure.

Against this terrible disease, which the Greeks call *φθειρα*, many have invented divers remedies. The *Irish* and *Iseland* people (who are frequently troubled with Lice, and such as will fly, as they say, in Summer) anoint their shirts with Saffron, and to very good purpose, to drive away the Lice, but after six moneths they wash their shirts again putting fresh Saffron into the Lye. But *Antigonus in Synag. Histor. Paradox.* so soon as little pusshes or wheels appear upon the body, bids us prick them, and take forth the Lice: but if they be left unprickt, that general lowsie disease will come, whereby they say that *Alcmaeon Physicus*, and *Pherecides Syrus* were destroyed.

The general Cure of the lowsie Disease.

Amatus Lusitanus cured that good Venerian at *Ancona* (of whom I spake before) who was sick of a general lowsie disease. First, by opening a vein, and then purging him; for so he drove forth the corrupt humours that fomented the disease, not at once, but twice or thrice. Afterwards by applying Topical remedies, in a short time he grew free of this plague. Topical Medicaments were made thus: Take bitter Lupins iij. pugils, seeds of Staves-acre ij. pugils, in the sharpest Vinegar what is sufficient, boyl them, and with that Vinegar wash the body from head to feed, then wipe and dry it, and anoint it with this oyntment following: Take Staves-acre two parts, Sandaracha of the Greeks one part, the finest Nitre half a part, mingle them all with the sharpest Vinegar and oyl of Radishes, and pound them together very exactly, and with these make an oyntment: with which *Amatus* soon attained his purpose, that the sick fell no more into the same foul disease. *Amat. Lusitan. cent. 3. curat. 58.* *Herod.* (as *Iosephus* and *Agesippus* testify) when he had got this disease by his great pride, and he was so smitten from God, he went to the Baths beyond *Jordan*, and the *Bituminous Lake*, that were very good to cure this disease, but at that time they were of no force, when God was pleased to punish a proud Prince with a contemptible creature. If the body be lowsie all over, it shewes a general Cacochymia, wherefore it is best in my opinion, first to open a vein, and then to give a Purge, as the humour requires, and so to proceed to specifics, and such as agree with the place affected. *Dioscorides* prescribes such kindes of internal remedies: Take Garlick with the decoction of *Origanum*; drink this three daies. Another, Let the sick drink Coriander bruised with *Origanum*, and anoint himself outwardly with Honey. He commends also Alum-water, and the Decoction of Betes, juice of Ivy and the gum of it with Honey, liquid Pitch, Alum, Synopex smeared on with Vinegar, Nitre with Samian Earth and Oyl.

Other outward Remedies that kill Lice, out of Pliny: Seeds of Staves-acre beaten, without the hulls, will free the body from Lice, but better if you mingle them with the Sandaracha of the Greeks, Mustard-seed, Garlick, with Vinegar and Nitre are good for the same. Oyl of Radish doth cure the lowsie disease contracted for a long time. Siler, Mountain-seed beaten with Oyl, Hyssop, mingled with Oyl, Tar, sweet Gums, the juico of the wilde Vine, and Staves-acre boyl'd in Vinegar, will free garments from them. So black Hellebore with Oyl or Milk anointed on is very good. *Internal Remedies out of Pliny.* A Snakes cast skin powdred and drank for three daies, will keep the body free from Lice. Mustard-seed, or seed of Tamarisk, drank, are good; so is water of Radish-leaves, and the juyce of Priver-berries, Plantain, Garlick, the juyce of wilde Cucumer, and Tar. *Nonus* commends the root of the sharp Dock, bruised with Oyl and anointed, first washing the body with the decoction of *Lupins*, and he prescribes a remedy of Sandaracha of the Greeks, Nitre, and Staves-acre. *Oribasius* approves the juyce of Pellitory long rubbed on, or Nitre with the wilde Vine in a Bath. *Rhasis* prefers the leaves of Barberies, gum of Ivie, great Knot-grass, and Sea-water. *Avicenna* commends Quicksilver with oyl of Roses, and wilde Staves-acre with Arsenick. *Haly Abbas* bids us purge the body, and then to eat meat of good juyce, to wash away the filth, and to change our clothes often: then he prescribes Quicksilver bruised with Staves-acre-seed, and oyl of wilde Saffron, and with that to anoint the body morning and evening, after bathing. He farther commands us to use these Remedies: Take long Birthwort, bruise it with Pine-leaves and Quicksilver, and with oyl of *Lupins* what may serve turn, make an Unguent. Anoint the body with that at night, and in the moining wash it with

with hot water, after that, with a decoction of Alum, Wormwood, Santonicum, or Mugwort, rub it away. *Another*: Take round and long Birthwort, red Arsenick, that is the Greeks Sandaracha; and with oyl of Ben. make an unguent, with this anoint the body in the evening, and in the morning rub the body with Bran and Barley-meal. *Another*: Take bitter Costus, Cardamomum, Buls gall, bray them with the Oyl of Pistaches, anoint the body with it, and in the morning wash it with the water of a decoction of clear Bran, or of Barley. *Constantinus* used Quicksilver with ashes, Licharge, Vinegar and Oyl mingled together for hot complexions; but for cold he used Pine-tree juyce, Sea-water, Staves-acre, Nitre, Arsenick, and oyl of wilde Saffron. *Johannes de Rupe scissa*, mingled Quicksilver with Aqua vitæ, and the powder of wilde Staves-acre, with that he provides a girdle, which worn about the bare loyns will kill the Lice. *Serenus*, *Abinzoar*, *Amatus Lusitanus*, *Matthiolus*, *Hildegardis*, *Johan. Vigo*, and others, prescribe other remedies, but most of them of these materials. He that desires more remedies against the lowlie disease, let him read *Paulus Ægineta*, l. 3. c. 3. *Galen* l. 1. de comp. med. sec. loc. and *Guiliel. de Saliceto* l. 1. c. 48. I knew one (saith *Pennius*) who when he was Governour of an Hospital, he cured the lowlie disease thus: He whipt the sick till the skin came off with Birchin rods, and where the prints were, the Lice would never breed again: A new kinde of cure, and most fit for idle Sea-men and slothful companions. *Amatus Lusitanus* (if I do not mistake) tels of a poor man that had a hole in his back by reason of an Ulcer, out of which daily abundance of Lice crept; questionless they were bred between the skin and the flesh, and afterwards by an unguent of wilde Staves-acre, Quicksilver, Pepper, and Lard, he was cured. *Raland* prefers the Balm of Sulphur to all remedies, and not without cause.

Actius writes, that wilde Lice must first be picked out with great diligence, then the place must be fomented with warm Sea-water; yet very warily if they stick in the eye-browes, that you hurt not your eyes: then apply this remedy: Take Alum Scissil ij. drams, Staves-acre j. obolus, Pepper j. obolus, burnt Brais j. dram, Myrre ij. oboli, Scissil-stone ij. oboli and half, Misy torrefied j. dram; bruise it and dry it, and so use it: Then let them bathe and heat their head with discutients and strengthners, wash the whole body, and rub it again. Our Countreymen pick them out, and then they anoint the places well with black Sope, and if the body were too hot, anoint the body with the pap of a sweet apple mingled with Quicksilver, and it is a certain remedy. *Celsus* saith they offend the eye-browes so much sometimes, that the eyes being ulcerated they dim the sight, then incorporate purified Quicksilver with tops of Wormwood, and old Hogs grease, for nothing doth more certainly cure one, if it be done with caution. Also take Aloes j. ounce, Ceruse, Frankincense, each v. ounces, Lard what may suffice, make an unguent; some mingle with this Quicksilver and Brimstone. But here observe, if Crab-lice do breed thick on the beard, eye-browes, the share, and peritonæum; first all the hairs must be shaved off, so soon as a general purgation hath been taken, and then the forementioned Topicks must be applied, and all galls, especially Buls gall, Calfs gall, Capons and Partridge, with juyce of Centaury and Quicksilver, are held very good. A lye of the ashes of Tamarisk destroyes the Lice. *Rhasis* and *Albertus* commend the marrow of a live Vulture taken forth. *Varignana* useth the milk of the greater Bindweed, wilde Mints, and Sow-bread, with a lotion of Honey. But chiefly he extols this Medicament: Take Staves-acre ij. ounces, Wine iv. glasses, Hogs bristles ij. ounces, purged Quicksilver j. ounce, let them boyl, and foment the body with the decoction. *Marinellus* and many others make great reckoning of Wine-lees, juyce of Broom, a Lixivium of Sena, Acorns, Cassia, Pellitory of Spain. But *Gilbert* an Englishman burns Leeches and Stryax Calamita together, and with these and Hogs bloud, he preparss an excellent Unguent.

These filthy creatures, and that are hated more than Dogs or Vipers, by our daintiest dames, are a joy to those that are sick, and sometimes a cure. For they that have lain long sick of a putrid disease, when Lice breed in their heads, they foreshew the recovery of the sick. For it is a sign of the exhaling of it, and flying forth from the centre to the circumference. Also experience proves that the Jaundies are cured with twelve bruised Lice drank with Wine. *Pennius* gave Lice and Butter to beggars and such as live on alms, very often, and so he recovered some that were almost desperate; some for the Dysurie are wont to put into the yard living Lice the greatest they can, to draw forth the urine by their tickling: which *Alexander Benedictus* relates of Wig-lice, when clammy humours have hurt the eyes, some cleanse them with Lice put into them, which creeping here and there like *Oculus Christi*, collect the matter; and wrapt up in that they will fall out. Also what shall I say? Apes, Baboons, will feed on them. And *Herodotus* and *Strabo* in *Pontus* speaks of men that feed on Lice, (to whom *Arianus* in *Periplo* consents) and the Spaniards speake the same of the Inhabitants of the Province of *Cuenensis* in the West-Indies. And they hunt after them so greedily and desire them, that the Spaniards can hardly keep their slaves from feeding on them. And it is no wonder that they can feed on Lice, that devour Horses, Asses, Cats, Worms (and more than that) men that are raw. But because it is an idle work, the women have that task put upon them to catch Lice, and they do that work almost, and therefore *Strabo* calls them *Pedilegas*. *Serenus* makes another use of them, and writes thus:

Some

Aaaaa

Some hurtful things our bodies do produce
By nature, which do stand us in great use,
To keep us waking, and to stop th' abuse
Of sleeping over much —

See the Chapter of Nits amongst the Insects without feet: Chap. 35.

CHAP. XXIII.

Of the Lice of brute Beasts and Plants.

THIS plague fell not only on Man for his first transgression, but upon beasts also: yet amongst mankind children are more full of them than young people, men than women, sick people than sound, nasty people than such as are cleanly; and so it is with other creatures: only the Asse is said to be free from this disease, not because Christ rid upon him, (as some fools dream) but because he goes so softly that he seldom sweats, or else God hath bestowed upon him some peculiar antipathy. The Lion is a courageous creature and king of beasts, yet is he so tormented with Lice feeding on his eye-browes, that when he cannot help himself with scratching with his claws, he will sometimes grow furious, as *Pliny* reports. Who hath not seen the Lice of a Horse, that most generous four-footed creature, and Nits with red heads that are apparent, and the rest of their body is of a dark white? The Lice of Oxen and Calves are black, and those that are lean have very many, like to Hog-lice almost, but shorter and somewhat thicker. Hog-lice have the same form, but they are so great and hard that you can hardly kill them with your fingers, these are called *Urti* from burning, as *Albertus* testifieth l. 4. c. 205. Dogs though more seldom, yet are sometimes Lowse; but their Lice are small ones, speckled, and with a whitish head, the rest of their body is of a blackish or wan colour from blew, as I first observed by the Dogs at *Malta*. Sheeps Lice are very small, their heads are red, their bodies white. Goats Lice differ but little from these: when the stag hath strove to cast his horns, he is troubled with an exceeding itching of his eye-lids, from Lice that breed of the same colour with their head that thrusts forth: who doth not know by *Gesners* History of Birds, or by his own experience, that Swans, Hens, Geese, Pigeons, Quails, Pheasants, Partridge, Hawks, and other fowl have Lice? Also *Palladius*, *Columella*, *Paxanus*, *Varro*, and other principal Leeches for cattel, have shewed us remedies sufficient for to kill Lice in brute beasts, that it will be no glory for me to insist upon them, nor fruitful to the Reader: what *Avicenna* l. 4. fen. 6. tract. 5. meant by Vultures Lice, I cannot conjecture, and I much desire the help of some *Oedipus* to untie this riddle for me: we mentioned before in our first Book, that your dung-Beetles are killed by their own Lice. Also Salmon-fishes, especially the leaner sort, were seen by *Pliny* to have many Lice under their gills oft-times. Also they are found in Plants, as Southernwood, Wormwood, flowers of Water-lillies, and chiefly in Columbine leaves, in *June*, by reason of its exceeding sweetness, (saith *Gesner*). Also some plants are called lowse plants, either because they are good against them, as Staves-acre, or because they breed Lice, as *Dodonaus* his *Fistularia*, or because they abound with Lice, as Columbines, or from the great despicableness of them, as the fruit of the great plum-tree, which are therefore called lowse plums.

CHAP. XXIV.

Of little Lice called Syrones, Acari, and Tineæ, or Hand-worms, or Mites in living Creatures.

Ho. à Viga falsely reports that the Ancients knew not what Syrones were, for *Aristotle* calls it *anaeiðw*, 5. *Hist. Animal.* c. 2. Also they seem to be called Syrones, *and τὸ ἀνὰ τὴν ἐγμύ*, because they creep under the skin continually. It is the smallest living creature that is, which useth to breed in old cheese and wax, and also in mans skin. *Pollux* and *Snidas* say that *anaeiðw* is such a small thing as is too small to be divided. In Latine they are called *Pedicelli*; in French, *Cirons*; in Piemont *Schri*; in Gascony, *Brigantes*; in English, *Mites*, in cheese, leaves, dry wood, and wax: but in men they are called *wheel-worms*; the Germans call them *Seuren*. *Abenzoar* saith that Syrones are called *Asoalar*, and *Asoab*, they are little Lice creeping between the skin of the hands, thighs, and feet, and raising watery blisters there, they are so small creatures, that a good eye can hardly discern them. *Gabucinus* saith; Unto our times a kinde of filthy torture that is not to be endured, is continued, a very small Lowse, not so great as a Nit, creeps under the skin. And *Johan. Phil. Ingrassias* out of *Abenzoar*, describes them very handsomely

somely thus: when the skin is excoriated when that small little pimple and push appears like to a red angry wheal, little living creatures creep forth so small a man can hardly see them. And *Joubertus* writes, that *Syrones* are those, that are the smallest Lice of all, alwaies lying under the outward skin, and creep under it as Moles do, biting it, and causing a fierce itching. They consist of a dryer matter than *Morpiones*, which for want of glutinous matter, is almost divided into Atoms. They breed often in the head, and eat the roots of the hair. The Greeks call them *τερχεῖς*, *αἰτῆς*, *τερχεῖς αἰτῆς*, *αἰτῆς*, *τερχεῖς*; some call them *Tineas* by a peculiar name. *Syrones* have no certain form as *Scaliger* well observed, only they are round: our eye can scarcely discern them, they are so small, that *Epicurus* said it was not made of Atoms, but was an Atom it self. It dwells so under the skin, that when it makes its mines it will cause a great itching, especially in the hands and other parts affected with them, and held to the fire. If you pull it out with a needle, and lay it on our nail, you shall see it move in the Sun that helps its motion; crack it with the other nail, and it will crack with a noise, and a watry venome comes forth; it is of a white colour, except the head; if you look nearer it is blackish, or from black it is something reddish. It is wonder how so small a creature, that creeps with no feet as it were, can make such long furrows under the skin. This we must observe by the way, that these *Syrones* do not dwell in the pimples themselves, but hard by. For it is their property not to remove far from the watry humour collected in the little bladder or pimple; and when that is wasted or dried up, they all die shortly after: whence we collect that as they breed from putrefied whey, so again they are sustained by it. None of the Ancients, except *Abinzor* writes of these, who saw this disease, and rightly set down the remedy. Nor are those *Syrones* of the kinde of Lice, as *Johan. Langius* seems to assert out of *Aristotle*; for they live without the skin, but these not, nor do I know that *Aristotle* in any of his writings, placed *Acaros* amongst Lice.

How cruel a disease this is, and to be compared with the lowlie disease, an honourable English Lady of sixty years knowes, she was the most vertuous Lady of *Penraddock* a Knight, that by drinking too much Goats-milk (for she feared a consumption) was for ten years troubled with these wheal-worms, with which night and day she was miserably tortured in her eyes, lips, gums, soles of her feet, head, nose, and all her parts, that she lived a very grievous life, alwaies without rest, and at last in despite of all remedies, the disease increased, whereby her flesh was consumed, and she died thereof. I must not overpass this, that the more the women that sat by her, picked them out with their needles, the more their young ones bred, and when they had gnawed the flesh also, they grew to be bigger. Hence let proud despicable mankind learn, that they are not only worms but worms-meat; and let us fear the power of that great God, who can with so contemptible an army confound all pride, haughtiness, daintiness, and beauty, and conquer the greatest enemy. It may be some will think it impossible for these Wheal-worms to breed between the eyes; but we see it is so, and we finde it was done so formerly, by an Epistle of *D. Le Janne*, a Chirurgion to *Jacob Guillimans*, his words are these: Know, saith he, that in the conjunctive membrane, or white of the eye as they commonly call it, some great Wheal-lice by creeping up and down here and there, biting, will make the place itch so much, that a man cannot hold from rubbing. In this case used remedies the Ancients used against the Lowlie disease, but to no purpose. Then my friends sent me to a sick woman, who with a silver needle pickt out these worms so cunningly and without all pain, that I wondred at it. And indeed had not I seen these little creatures to creep with my own eyes, I could never have believed that Wheal-worms could breed there. They dye for want of moisture that is salt, and are killed with contrary remedies. The common people ordinarily picks them out with a small needle, (the Germans call them *Seuren Graben*) but since this takes not away the cause of them, which fosters them, the disease still abides: wherefore it is best to kill them with an unguent or fomentation, which may at once take off that troublesome itching. That which penetrates most and kills these *Syrones* is salt and vinegar. *Laur. Joubert. Job. Arden*, formerly the most learned Chirurgion of England, saith that a Lotion with Sublimate kills them quite. And it seems not to be against reason: for it dries, penetrates, resists putrefaction, and by its heating acrimony kills them all. *Abinzor l. 2. c. 19. tract. 7.* prescribes these following remedies. First purge the body with an infusion of wilde Saffron-seed, and Nettle-seed, after that anoint it outwardly with the oyl of bitter Almonds, or *de Chervas* and with the juice of the leaves of Peach-tree: give boyled Partridge for meat, and leavened bread. Let the patient abstain from all kinde of fruit (except almonds) especially from Figs, Grapes, Jujubes, and Apples; rub the body often with the substance or pulp of Melons, or with the Mucilage of the seed. But if the body be fleshy, rub it with the juyce of the leaves of the Peach-tree. *Pliny*, where there is this disease, forbids Oxe-flesh, Hogs, Geese, and all kindes of Pulse.

Erotis l. de pas. mul. writes thus: Wheal tempered with Wine, adding thereto powder of Frankincense, put to the parts affected for a plaister, will kill these wheal-worms every where, chiefly upon the cheeks and foreheads. Another: Take common Salt, black Soap, live Brimstone, each alike, incorporate them with vinegar of Squills, and anoint the place with them. Another for *Syrones* on the face, which the Author of the English Rose calls *Barrones*: Take sharp Dock, Frankincense, Dragons cattle-bone, each alike, make a powder, and thrice in a week rub the places where the Worms breed, but first wash your face with a decoction of Bran, and on Sunday wash your face with the white of an egg and white Starch, and then wash it often with

with river-water, or with white starch. *Alexander Petronius Traianus* commends this remedy most: namely a fine linnen cloth made into lint, that it may be the softer, and stick the faster: binde this to the part affected, then lay on the white of an egge that is rosted hard, whilest it is hot, and cut into large pieces, and then binde upon it some thicker cloth, and so let it remain some hours. Then taking all away, you shall finde the inward lint full of these small Lice, which is thus proved: shake this over the fire, and you shall easily hear these young Syrones crack. Against hair-eating Worms and Mites in the heads of children, that are usual, and that will make little holes in them, *Alexius* makes great account of this remedy. Take Frankincense, Bores-grease so much as you please, let them boyl in an earthen vessel that is glased, and make an unguent. Another: Sprinkle on the powder of burnt Allum, and lay on some lint. Another not uneffectual: Powder quick Brimstone, with Rose Vinegar of Squils, or else incorporate it with Rose-water, and binde it on with a cloth for 24 hours. Another that is most certain: Take juice of Lemmons and Aqua vitæ, each alike, burnt Salt what may suffice, mingle them, and anoint with them often. Another of *Hildegard*; Apply that skimming of the air, that is, those cobwebs that are scattered in Autumn, and it will certainly destroy all those Syrones and little worms. Also strew on the powder of Bees that are dead in their hives, on the places affected, and they will all dye, chiefly if it were mixt with Aqua vitæ, or Vinegar of Squils. Again: binde on the crums of white bread whilest they are hot, do it often, the heat will kill them. Fir-tree seed burnt to ashes, which growes on the top of the tree, if it be strewed on, will help much. Also the kernels of Barberries, powdered and laid to the place, will kill Syrones. *Johan. Vigo* prescribes these remedies against Syrones wheresoever they breed. All bitter things, saith he, are good against them, shave the part affected, that they may penetrate the better. Oyl of Vitriol warily and lightly powred on will kill them mightily. Quicksilver with French Soap and a little Orpiment, and some Vinegar of Squils and some Aloes, doth much good. For Syrons in the Teeth: Some call the Worms that breed in mens teeth Syrones, which they affirm have fallen forth like shavings of Lute-strings by the smoke of Henbane-seed, received at the mouth. Though I should truly deny that these shavings are Worms, yet that Worms breed in rotten teeth Barbers and every man knowes. Against venomous Syrones, *Abinzoar* calls it the disease of Oxen, between the flesh and skin there breeds a kinde of venomous Worms; which raiseth no small tumour, as great as a walnut, wherein the Worm Syro lies hid, (he is venomous indeed, though he be but little). This disease neglected will kill. He appoints the Remedy thus: The place must be presently burnt with an actual cantery, then apply lint with Barly-meal and sweet water: when the pain of the burning is over, the humour will fall being anointed with Unguent of *Agrippa* and oyl of Roses, then wash the place with water of Honey, and strew on powder of Roses; and then using incarnatives, close up the wound. But if the part cannot be cauterized or cut, take Lupine-meal, Soot, Pepper, root of Endive, each alike, and bruising them all, and wetting them with Alchitra, fill half a Nut-shell with them, and keep them on so long, till the force of the medicament may penetrate to the Worm: but great care must be had that no part be left bare without the shell. A little creature called *Nigua*, as *Thevet* imagineth, doth much vex the West-Indian people. It is saith he an Insect most offensive to mens hands, far less than a Flea, but breeds in the dust as a Flea doth. *De Lery* was taken with the same oversight, and was not ashamed to be niad with *Thevet* for company. But *Oviedus* affirms that they breed between the skin and the flesh: but especially they breed under the nails of the fingers, into which place, when once they are rooted, the cause a swelling as great as a pease, with a mighty itching, and they multiply like to Nits. Now if this worm be not timely pickt forth with its brood, in a few daies this itching becomes a wonderful pain, and the sick dye with the violence of the disease. There is a Worm that breeds on the bodies of Hawks and Faulcons under the roots of their wings, it is called *Trosta*: we have left off to doubt any longer whether it be a Syron, *Acarus*, or *Tinea*, or not, by reading *Albertus* his Book, wherein you may read a remedy for that disease at large. Also, as *Bonaccolus* reports, in the urines of some women with childe, little red Worms called Syrones will be seen, which are a certain argument of conception. *Dermestes* is an Insect that will consume skins, and from skins it hath its name, and as the skins vary, so that changeth its colour. For oft-times it followes the colour the skin is of: it is as big as a Flea, with six feet and a forked nib. Also a Moth consumes clothes, especially woollen clothes: for it is a very devouring creature, and breeds from Butterflies as I said.

CHAP. XXV.

Of Wall-lice.

THE Greeks call it *xels*, the Latins, *Cimex*; the Hebrews, *Pischpeser*, from seeking; for it seeks after living creatures that are asleep, to suck their blood. *Isidore* will have it called *xels* and *Cimex*, from the herb *xels*, which they call *Cimicaria*; I confess ingenuously I know not what herb it is, unless it be that low and stinking kinde of wilde Orach, which growing near to wats and heaps of dirt, is called by a bawdy name, *Vulvaria*. For *Coris* of *Matthiolus* smells well

well, and therefore agrees not with *Cimicaria*. The Arabians and Barbarians call it *Alcarad*, *Debuliar*, *Fesases*, *Coroda*, and *Corab*: the Germans *Wantlausz*; the English, *Wall-lowse*; the Saxons *Wantzen*, that is *Wall-lowse*; the Brabant people call it not amiss *Wuegluys*, or *Lowie* of bedsteads; the Spaniards call them *Chimesas*; the Italians *Cimice*; the French *Punaise*. Now Wall-lice are either home-bred and without wings, or winged and wilde Lice. We spake of these in the first Book, now we shall speak of those that breed in houses.

This home-bred Lowse is a creature naturally disdained, to use the words of *Pliny*, it is almost like to a Tike, for the body of it is of the figure called *Rhomboides*, black of colour with a little red: it hath short feet near the neck, on each side three, and the belly and back marked with incisions; the skin is very thin, that it will break in pieces with the least touch, and send forth a most abominable stink. In the night by biting sharply, it sucks blood out of mens bodies to sustain it self. For like Moths it cannot endure the light, and when the day breaks it will go into chinks of beds and wals. After it hath bit it leaves behinde purple spots swoln with an itching pain. They are bred, after *Aristotles* opinion, from moisture that sweats forth on the surface of the bodies of living creatures, *lib. 5. c. 32. histor.* but without doubt they arise from other humours corrupting about beds, and that sweat out of wood by degrees. Also they propagate by copulation, as *Pennius* observed about *Orleance*; for whilest he kept company with a Spaniard born at *Capera*, he strove to draw his sword to cut off a bough: but when he could hardly do it for the rust, he was forced to cut his scabbard, where he found abundance of great Wall-lice, with a great company of young ones, and a multitude of whitish eggs of a wary complexion. *Scaliger* saith they will breed in Hens nests, and also in a short time they will infinitely increase in the Quails nests. They are frequent in Fir-tree bedsteads, and chiefly when the straw grows old. Also they will breed in paper-books. *Ludovicus Vives* in his Dialogues, thinks that wals overcast with Alabaster are the most ready to

breed Worms. It is commonly said (saith *Josephus Scaliger*) that Wall-lice will breed from Wall-lice bruised, which is hardly credible. *Cardan* that was a fancier of subtilties, writes that the *Carthusians* are never vexed with Wall-lice, and he gives the cause, because they eat no flesh. The beds at *Toulouse* (I use *Scaligers* words) eat no flesh, yet they are noted for breeding Wall-lice. He should rather have alledged their cleanliness, and the frequent washing of their beds and blankets to be the cause of it, which when the French, the Dutch, and Italians do less regard, they more breed this plague. But the English that take great care to be cleanly and decent are seldom troubled with them. In the year 1503. when *Pennius* writ this, he was called in great haste to a little village called *Morecluck* near the Thames, to visit two Noblemen, who were much frightened by perceiving the prints of Wall-lice, and were in doubt of I know not what contagion. But when the matter was known, and the Wall-lice were catched, he laught them out of all fear. Against those enemies of our rest in the night, our merciful God hath furnished us with remedies, that we may fetch out of old and new writers, which being used will either drive them away or kill them. For they are killed with the smoke of Oxe-dung, Horse-hair, Swallows, Scolopendra, Brimstone, Vitriol, Arsenick, Verdigrise, *Lignum aloes*, *Bdellium*, Fern, *Spatula Foetida*, Birthwort, Clematidis, Myrtills, Cummin, Lupins, Knotgrass, Gith, Cypress, as we read in *Aetius*, *Rhasis*, *Florentinus*, *Didymus*, and *Cardan*. But the best way is with curtains drawn about the bed, so to shut in the smoke, that it can have no vent. And for this end unguents, oynments, Embrocations are provided of gall of an Oxe, the Goat, Hedge-hog, Calf, the Goat, Asse, with the leaves of Cucumers and Ivy, Citrons, Ising-glass, Oyl lees, Oxe dung, and the sharpest Vinegar, quick Brimstone, Squils, Capers, wilde Staves-acre, Wormwood, sweet Wine, Lime, Quicksilver, Bayes, black Soap, winter Cherries, juyce of Oranges, Lemons, &c. whereof consult *Varro*, *Palladius*, *Arnoldus*, *Didymus* and others: what concerns preventional means, Hemp-seed, or winter Cherries laid near the bed, or hanged up drive away Wall-lice. *Democritus* saith, that Harts-horn or Hares feet hanging about the bed-posts, will do as much: which another author ascribes to a Foxes ear. The dregs of boyled Butter cast where there are Wall-lice, will wonderfully kill them, for they will feed on that till they burst. May be this is that fat whereof *Cardan* speaks in these words: I knew once, saith he, but I have forgot, a fat, that being smeared on a wooden round circle, would so allure all the Wall-lice unto it, like a charm, that one could scarce see the wood for them. Some say that a half-penny laid under the bed will drive away Wig-lice. Some hang by a sheet wet in cold water, and so by actual cold they drive them away. Oyl of it self or with Vitriol, or Bulls gall, or the decoction of black Chamæleon will drive away Wall-lice. Moreover all things that are exceeding bitter, and have a stronger smell, are doubtless good against Wall-lice. And that strong smells will drive them away, *Olaus Magnus* shewes by many raw hides heapt up together. *Alexander Benedictus* saith that when these multiply over much, they foreshew the plague. For it signifies a corruption of the air, or humours, or both. *Bacchus* descending to hell, as the Greek Comedian wittily sets it down, desired *Jupiter* to assign him such Innes in his journey, where there were but few Wall-lice: yet saith *Pliny*, that concord and discord, which fills all Physick, by the conduct of nature hath produced nothing that in some part is not good for man, and therefore that which that Co-

median God thought hurtfull, mans posterity hath found beneficiall. Indeed wall-worms are of a corroding quality, yet have they place in Physick; for taken with the bloud of a Tortoise they cure the bitings of Serpents. By their smell the Epilepsie that ariseth from the strangling of the Mother, is dissolved. Inclosed in an Egge or Wax or a Bean, and swallowed, are good for an Impostume, and a Quartan Ague, and will help them (saith *Pliny*, *Dioscorides*, *Galen*, *Marcellus*, *Aetius*, *Aduvius*.) Drank with Vinegar or but smelt to, they will remove Horseleeches that stick too fast. Also the Verses of *Quintus Serenus* shew that they are good for Tertian Agues.

Shame not to drink three Wall-lice mixt with wine,
And Garlick bruised together at noon-day.
Moreover a bruised Wall-louse with an Egge, repine
Not for to take, 'tis loathsome, yet full good I say.

Gesner in his writings confirms this experiment, having made trial of it amongst the common and meaner sort of people in the Countrey. The Ancients gave seven to those that were taken with a Lethargy, in a cup of water, and four to children. *Pliny* and *Serenus* consents to it in these Verses.

Some men prescribe seven Wall-lice for to drink,
Mingled with water, and one cup they think
Is better then with drowsy death to sink.

And he of old sang, that bleeding at the nose would be stayed with the only smell of Wig-lice. Some there are, that cure dark sights by reason of a Cataract, bruising these with Salt and Asses milk. Many annoynt painfull ears with honey mingled with Wall-lice, to good purpose. Also *Marcellus* saith they stay vomiting, and he saith it is a certain remedy, if a bruised Wall-louse be swallowed in a rear-egge, by one that is fasting, and knowes nothing of it. *Pliny* seems to prove from thence, that they are good against the stings of all Vipers, Adders, and all kinde of Serpents, because that Hens that feed on these, are free from the stinging of these Creatures. *Aetius* commends Wall-lice against the Strangury, and to drive forth the Stone. *Vegetius* in this case puts one Wall-louse into the ear, another into the passage of the Yard, and with a gentle friction of the parts, he affirms that they will presently make water, which remedy he seems to have borrowed out of *Herod* in his Hippiatrics. *Galen* Exp. 5. reports, that Wall-lice will not only provoke urine, but also drank for nine dayes space, will stop childrens water that goes from them against their wills. *Valerandus Donures* an Islander, a most learned Apothecary of *Lyons*, often said, that these drank with water hot, or wine, or broth, would wonderfully help those that were troubled with the Stone. Moreover, the later writers wonderfully commend the ashes of them with a fit decoction tast in for a Clyster, to bring forth the Stone. If they be bruised and annoynted on the passage of the yard, it will presently provoke urine. *Marcellus*. There are saith *Gesner*, that for the Colick prescribe four live Wall-lice to drink in wine, in the morning, and then they command to fast two hours after, and they give as many to drink two hours before supper, and so again the next day untill they have drank up twelve Lice: truly it is a remedy to be despised, but it is no new remedy in that desperate disease, and it is a present cure. It helped *Funtius* the Governour of *Zurick* at the second taking, and so it did some of his Kindred also, and he was like to have written a commendation in praise of Wall-lice. What concerns outward diseases. If you pull up the hair by the roots, and annoynt the part affected with the bloud of Wall-lice, and let it dry, it is the opinion of *Galen*, *Aetius*, and *Nonus*, that they will never grow again. *Pliny* saith that if you annoynt the breasts with Goose-grease and Wall-lice, the pains will abate, the Moles of the matrix will break forth, and scabs of the privities will be cured. *Cornelius Gemma* in his Appendix of his *Cosmocrítica*, speaks of a woman in whose Skull opened, were found abundance of Wall-lice.

CHAP. XXVI.

Of Tikes, and Sheeps Lice.

THE Tike in Latine *Ricinus*, in Greek *κεντρον*, *Hesiodus* calls it *αροτρον*, *Suidas* *αροτρον*, and others call it *αροτρον*, *Syontinus* calls it *αροτρον*, but that is not right, for it wants wings. The Arabians call it *Alcharad*, *Alfaseset*, *Albalem*, as *Bellunensis* reports. The *Fertini*, saith *Hermolaw Barbarus*, to this very day call Tikes *galas*, as we read in *Dydimus Zelonotes*. It is called *Ricinus* in Latine, because it is like the seed of the Plant *Palma Christi*. *Gaza* calls it *Reduvium*, and *Albertus Vincentius*, *Guillerinus de Conchia*, call it *Engulam*. I think that at first it was called *Cica*, saith *Scaliger*, because *Cici* is the same with *Croton*. The Italians call it *Zeva*, the Germans *Haltzback*, the French *Plata*, from its compact body, the English Wood-teek. Some distinguish between *Ricinus* and *Reduvius*, thus very exactly.

Ricinus

Pierius is a small Insect, that when Summer comes on breeds in pastures among grasse, and in Woods amongst the leaves, of some putrid humour: with a very compact body and that feels plain, with a skin very tough, of a Diamond figured body, of a black shining colour, or a dark brown; but so soon as it fasteneth to any living Creature, and thrusting its head within the skin, & drawes the blood, in a short time it growes great and swells, and at length becomes almost round. It hath six feet fastened to its neck, with a sharp nose, but short, it produceth no young ones, nor is it produced by other living Creatures, and in this it differs from all other Insects, that it is filled with food abundantly, and yet there is no passage for any excrement, and therefore it may be the *Hethurians* call it *Caca*. Let therefore the materiall Philosophers that with *Aphrodiseus* draw all things from the manifest qualities of the Elements, consider diligently, to what default of matter or confusion they will be here forced to fly. If they imagine, that Nature wanted a bodkin to pierce a hole in the tail, they deserve to be hissed at. But rather let them here see and acknowledge that of *Paracelsus*, *That bodies may be made from Spirits, and Spirits from bodies.* *Pliny* calls a Tike a filthy Creature, the end of whose gluttony is, as to gluttons amongst men, death it self. For in a few dayes it will break with over-fullnesse; yet it will fast lustily for seven dayes. I scarce consent to *Scaliger*, who supposeth Tikes will breed in a mans beard and groins, for being there fastened it will stick close to feed it self: yet *Eustathius* and *Hesichius* are of his side in these words. It is called a Tike, because it sticks fast to what it is bred in. But the truth is, a Tike is not bred in living Creatures, but from the corrupt matter of leaves and grasse as I said before, and as *Aristotle* affirms, *Hist. 5. c. 19. Tikes breed of Plants.* May be *Scaliger* meant by a Tike some Lowse like a Crab, or some Crab-lowse in man; for they both breed in the beard and privities, and can very hardly be pulled off. It cruelly plagues men and Oxen, but especially barking Dogs. *Cato* also testifieth that Sheep and Goats are troubled with Tikes, but he was deceived by the likenesse of their bodies; for that Lowse of Sheep should be called *Reduvius*, our Countrey-men say (a Sheeps Lowse) between which and a Tike there are many and different marks: For a Sheeps Lowse hath a long little beek, and its body when it is fullest is never so distended but being pressed, it will never seem round. Also the feet of this are of a dark red, the back Ash-coloured, marked with three black spots, and it is framed after the fashion of a heart. The head is not alwayes but seldome fast in the skin, and it drawes blood forth but by turns, and it voids the excrements that breed of it by the tail, and it will dy

Wooll of so deep a green, that this cold tincture shall scarce be bettered in a hor. dying Fat. Sheeps Lice will live a whole year in shorn Wooll; but Tikes live only upon the hot blood of the Creature. Let therefore *Cato* maintain them both to be of one kinde, yet truth will maintain a vast difference between them. *Sacos* is a little Creature, like to the swellings of leprous people, saith *Albertus*. *Gesner* doubts whether he understand by that a Tike or a Breez; I rather think he meant a Tike, both from the round form of the swellings, and from their wan colour. *Cato* frees shorn Sheep from Lice with Oyl lees well putrefied, and the best lees of strong wine, and a decoction of Lupins added to them, and anoynting them with it, then let them dry two or three dayes, and after that wash them with Sea-water. The English Shepherds shear them, and then anoynt them with Tarre and Sheeps suet; or else they bruise the root of Acorns, and boyl it in water, and they foment their bodies with the warm decoction. Some use nothing but Tarre, others use the root of *Manidragora*; but care must be had that the Sheep taste it not, for fear of the great danger of stupefaction that it will cause. Others boyl the root of Cypressse, and with that boyled they wash their Sheep. *Diophanes* in *Geopon.* Against Dogs Lice the Ancients bid us to anoynt their ears with Oyl of bitter Almonds and of Walnuts; experience confirms that remedy. Also *Nemesianus* testifieth as much.

'Tis good to noynt their ears, and set them in the Sun,
Or use a red hot knife, when Lice are first begun.

Rhasis commends against *Ascharides* of Dogs or Dog-lice, to wash them with Wine, and Vinegar, Cummin-seed and Salt-water. *Theophrastus* and *Cato* prepare oyl of bitter nuts, and with that they anoynt their claws and ears, and secrets also. Tarre of Cedar kills them. *Dioscorides*. But *Columella* forbids to pull off Tikes from Oxen and Dogs, lest the places should exulcerate, and he highly commends Tarre and Hogs grease. *Pliny* saith the juice of both Chamæleons will destroy them. *Albertus* reports that Tikes blood will cleanse Ulcers, and if they be infused in wine they will presently make one drunk. *Serenus* farther commends them for to cure a Fistula in

The Use.

If that new ulcers in the secrets chance to breed,
Chew'd Bramble-leaves apply, you quickly shall be freed.
Or if from an old sore a Fistula do grow,
A Weasils ashes burnt will help't; and further know,
The blood of an Ox Tike is no means else below.

Also

Also the blood of a Tike will cure the Shingles. Also men say, that a Tike pulled out of the left ear of a Dog, if it be tied on, it will cure all pains. *Pliny* writ this out of *Nigidius*. Also he asserts that if a womans loyns be anoynted with the blood of it, she will abhorre venery. Moreover nine or ten Goats Tikes taken in wine, will stop the terms. *Dioscorides*. Anoynt your eye-lids with the blood of a Tike taken from a Bitch, the hairs being first pluckt off, saith *Galen*, *Simpl.* 10. c. 5. and they will never grow again: So also *Pliny* and *Avicenna* write, but it is from other mens opinions. *Dionysius Melesius* prescribes such a Depilatory against pricking thorny hairs: Burn a Sea-hare in a new earthen pot, and keep the ashes with Tikes blood in a horn box, use this, first pulling out the hairs. Many *English* men have learned by experience, that one dram and a half of Sheeps Lice given in drink will soon and certainly cure the Jaundies.

CHAP. XXVII.

Of the Garment-eating Moth.

P*ennius* beginning to write the history of this Insect, saith that *Tinea* is a word that signifies many things; as Lice of Hawk-weed according to *Albertus*, Wood-lice in *Plantus*, the plague of Bee-hives in *Virgil*, and it signifies the creeping ulcers of the head, that are eaten like to garments, whence it may be *Claudian* writes;

The filthy Moths have gnawn the loathsome head.

Gaza translates *αἰμας* *Tineas*, but very ignorantly, as we observed in the history of Catterpillars. Also *Pliny* saith that *Tinea* do destroy the seeds of Figs, he means the Worms that breed in Figs, from whence grow *Thris*. *Niphus* calls that little Scorpion which eats books *Tineas*, whereof I spake in the history of Scorpions. But *Σκῆς* and *αἰμας*, if a man will speak properly, is a Worm that eats garments. It is called in Latine *Tinea*, a *tenendo* from holding, for it sticks fast in garments, and will not easily change its station. The French call it *Teigne*, the Spaniards *Tina*, the Italians *Tignola*, the Muscovites *Mel*, the Polonians *Mol*, the English *Moth*, the Hebrewes *Hhaseb*, and *Sas*, as you shall finde it *Job* chap. 13. and *Isai* 51. It is a little Worm of a wan white colour, of which ariseth that small kinde of Flie that will fly at night about the Candle-light. There are some of them that are silver-coloured, the English call them silver-moths, the Dutch *Schietes*, from their swift motion. *Niphus* greatly erred, making this the Scorpion amongst Books. There is also a certain Worm that is thick, or with a coat, saith *Pliny*, called *Tinea*, that drawes its coat along with it, as a Snail doth its shell, and when she is deprived of this she presently dieth. But if this coat grow too great, it changeth to a *Chrysalis*, out of which at a set time a little Glow-worm comes. This kinde hanging by a thred, hangs a long time in houses before it changeth to an *Aurelia*. It hath a little black head, the rest of the body is a whitish dark brown, the Case of it is something long, made almost of a Cobweb, not round at all, but lightly compacted, and at each end something hairy. The *Phalenz* that come from thence stick by the feet to the roofs of houses, untill their bodies being corrupted and putrefied they are bred again: when their bodies corrupt, and their wings and feet fall off of themselves, they hang with a thred by the tails. At length they get a Case and are turned into this kinde of Moth. In *Germany* and *Helvetia* there is a Moth of a sad red colour, with a little thick head, the body grows by degrees smaller even to the tail. The colour of its belly is lighter, something yellow, and like a soft downy silk. It is a very tender Creature, especially that which is silver'd over, and it is bruised to pieces if you do but touch it. Whence that Kingly Psalmist, *Psal.* 39. *When thou with chastisements shalt correct man, thou makest him to consume away as a Moth.* And *Job*, Chap. 40. he amplifying the certain destruction of the wicked: *They shall be bruised (saith he) before the Moth.* All Moths are reckoned amongst the number of six-footed Creatures, and they breed in Garments as well of Wooll, as skins that are not cleaned from dust and filth: and so much the sooner if a Spider be shut in, as *Aristotle* writes. For the Spider drinks up all their inbred moysture, and dries them; wherefore care must be had that garments be not layd up full of dust, and when the Air is thick and moyst. Some to avoid Moths, ventilate their garments in the hot Sun-shine: which our women severely forbid, and lay them up in the shade, and when the winde is high and very cold. For they hold that the Sun-beams are kindly for Moths, but windes and tempests and the shade are enemies to them. These Worms when they have by degrees insensibly eat off the outmost superficies of the cloth, then they eat up the inward part, and so insinuate themselves into the middle substance of it, that those that search never so well for them can hardly finde them. The Ancients were most expert to kill Moths. For the garments of *Servius Tullius* lasted to the destruction of *Sejanus*, for they were kept with so great diligence by the keepers of the Wardrobe, that they neither consumed by age, nor were Moth-eaten. They that sell woollen Clothes, use to wrap up the skin of a Bird called the *Kings-Fisher* amongst them, or else hang one in the shop, as a thing by a secret Antipathy that Moths cannot endure. They are handsomely destroyed by the sent and smoke of Savin, Hops, Finger-hood, Wormwood, Rosemary, Poley, Panax, Aniseed, Golden-flower, Pomegranates, Citron-pills,

pills, (for this was the chiefeft use of Citrons in old time) the out-landish Myrtle, Cedar, Cypresse, Calamint, Brimstone, Downy feathers. The Books that were found in *Numa* his Tomb, were said to be anoynted with the juice of Cedar: wherefore as *Pliny* writes, they were supposed to be free from Moths above 530. years. The bones of *Bergesters* (I know not what beast it is) being brought to powder, and strew'd amongst garments, will drive away Moths, if we will credit *Hildegard*: *Rhasis* reports that Cantharides hung up in the middle of the house will do as much: Who saith moreover that garments wrapt up in a Lions skin, will never have any Moths. Some wet a linnen cloth in a strong lie, and dry it in the Sun without pressing it, and they affirm, that clothes wrapt in that will not be Moth-eaten. *Cato* bids sprinkle your Wardrobe with Oyl-lees. That which *Pliny* reports is a wonder, that a Cloth laid under the Biere of a dead body, will never have Moths to hurt it. The richer people, who (as *Horace* writes)

Whose hangings rot in Chests, rich for the Worms and Moths,

take diligent care in Summer to look up their garments, and taking them out of their Coffers, they air them in open place for the winde, and then they beat off the dust with the leaves of *Indian* Millet, or Hogs bristles, or Broom Mosse, or with Worm-wood branches. Of old they were wont to do it with an Ox tail; for so *Martial* writes;

*If that with yellow dust thy costly clothes abound,
Thou mayst with an Ox tail brush't off upon the ground.*

There are also rich Merchants, that have Cedar and Cypresse Chests, and they put up powder of Origanum, Worm-wood, Orris, Citron-pills, Myrtle-berries with their clothes, and by such remedies they drive far from them this Wooll-devouring Creature.

We writ before amongst the six-footed Worms, of Worms in books, wood, the skin, the fruit devourers. I have nothing more to add to this Chapter, but only to exhort rich men to lay up their treasure there, where neither Moths shall eat their garments, nor rust consume their Silver; and let them in the mean time leave off that infinite expence in clothes, of which can they look for any better end, to use the words of the *Lyrick* Poet,

Than to feed black Bugs, and the Lazy Moths?

If a man, saith *Calvin*, born of a woman, having but a short time to live, and alwayes waxing old, and corrupting, would think himself to be like a garment that Moths eat, certainly he would lay aside all pride, and blush, and fall lowly upon his knees unto Almighty God.

CHAP. XXVIII.

Of the Flea.

THE Latin word *Pulex*, in Greek *ψύλλα* or *ψύλλας*, comes saith *Isidore*, from *Pulvis*, dust, or the son of dust; in Spanish *Pulga*, Italian *Pulice*, French *Puce*, English *Flea*, the Germans from its nimbleness in flight call it *Floch*. Fleas are not the least plague, especially when in greater numbers they molest men that are sleeping, and they trouble wearied and sick persons; they escape by skipping from us, and so soon as day breaks they forsake the bed. They are a vexation to all men, but especially, as the wanton Poet hath it, to young maids, whose nimble fingers, and that are as it were clammy with moisture, they can scarce avoyd. These Fleas are either common or extraordinary. The common ones are small Creatures about the bignesse of Lice, but their bodies are softer, and they are bunch-backed, almost like a Hog, they are black and shining, their breast and belly is yellow from black, in white Dogs they are more clear, in red more yellow, in black Dogs blacker than in others. Here I desire you to observe the wonder of Nature, that their hinder little legs are bent backwards toward their bellies, and their forelegs toward their breasts, as four-footed beasts are, as it is usual almost in all Insects to whom Nature hath given but four feet. It may be for that end the joynts of Fleas are so disposed, that they may with the more ease hide themselves in the long foldings and plights of the blankets from those that hunt after them. The ends of their feet are divided into two parts, and are hooked and sharp, and seem as it were to be horny, not only that they may more surely creep up upon high places, but also that they may sit and stick faster to the smooth skin: They have a little head, and a mouth not forked but strong and brawny, with a very short neck, to which one *Mark* an *Englishman* (most skillfull in all curious work) fastned a Chain of Gold as long as a mans finger, with a lock and key so rarely and cunningly, that the Flea could easily go and draw them, yet the Flea, the Chain, lock and key were not all above a grain weight: I have also heard from men of credit, that this Flea so tied with a Chain, did draw a Coach of Gold that was every way perfect, and that very lightly; which much sets forth the Artists skill, and the Fleas strength. The point of his nib is something hard,

hard, that he may make it enter the better. It must necessarily be hollow, that he may suck out the blood, and carry it in. They seek for the most tender places, and will not attempt the harder places with their nibble; with two very small foreyards that spring out of their foreheads, they both prove their way, and judge of the nature of the object, and whether it be hard or soft: where they bite they leave a red spot as a Trophie of their force, which they set up. In rainy weather they bite sorely, and are bold to run over ever part of mans body. They have but one small intestine, with folds inward, which is either relaxed or contracted as they eat more or lesse. The lesser, the leaner, and the younger they are, the sharper they bite, the fat ones play and tickle men more willingly. It is very probable that they have eyes, both because they choose their places of retreat, and because they withdraw themselves when the day breaks. They will not sit upon corrupt or dead flesh. Those that have the Kings evil, because they are of bitter juice, and such as will die, because of the corruption and stink of the same, they will not meddle with. At all times they trouble men and Dogs, but chiefly in the night. Though they trouble us much, yet they neither stink as Wall-lice doe, nor is it any disgrace to a man to be troubled with them, as it is to be lowlie. They only punish sluggish people, for they will remove farre from cleanly houses: when they finde they are arraigned to die, and they feel the finger coming, on a sudden they are gone, and leap here and there, and so escape the danger: whilst those that hunt them endeavour to measure their jumps, as *Aristophanes* saith, they but play the fools. In the morning, after they have fed, they creep into the rough blankets, and stick to the walls, or else they hide themselves in the rushes or dust: and so they ly in ambush for Pigeons, Hens, and other Birds, also for men and Dogs, Moles, Mice, and vex such as passe by. Our hunters report, that Foxes are full of them, and they tell a pretty story how they quit themselves of them. The Fox gathers some handfulls of wooll from thorns and briars, and wrapping it up, he holds it fast in his mouth, then he goes by degrees into a cold River, and dipping himself in by little and little, when he finds that all the fleas are crept so high as his head for fear of drowning, and so for shelter crept into the wooll, he barks and spits out the wooll full of Fleas, and so very frolicquely being delivered from their molestation, he swims to land.

Their first Originall is from dust, chiefly that which is moystned with mans or Goats urine. Also they breed amongst Dogs hair, from a fat humour putrefied, as *Scaliger* affirms. A little corruption will breed them, and the place of their originall is dry filth. *Martyr* the Author of the *Decads* of Navigation, writes, that in *Perienna* a Countrey of the *Indies*, the drops of sweat that fall from their slaves bodies will presently turn to fleas. Some Countreys are such enemies to Fleas, that if they be brought in thither they cannot live, nor will they breed there; as in the Territory *Tefethor* of *Sigellunum*. Contrarily the City *Hea* by the sea-side, (unless *John Leo* deceives us) is most fruitfull for Fleas, by reason of the abundance of Goats, as also *Dede*. In *Hispaniola* Fleas are found, but neither many, nor great ones, but they bite more fiercely by farre than ours doe: they love hot places, where the Sun shines. In the Spring they multiply, at the beginning of Winter they die, for they cannot endure the cold. They copulate, the male ascending upon the female as Flies doe, and they both goe, leap, and rest together. They stick long together, and are hardly pulled asunder. After copulation presently almost, the female full of Egges seems fatter; which though in her belly they seem long, very small, very many, and white, yet when they are layd, they turn presently black, and turn into little Fleas, if we may grant what *Pennius* saith, that bite most cruelly. *Philoponus* in lib. de generat. maintains that Fleas breed not Egges but Nits, and *Niphus* saith the same: But they endeavouring to prove this because they crack when they are crushed, doth not confirm their opinion, for Egges will not break under the nail without cracking. *Aristotle* thinks, that from them, be they Egges, Nits, or little Worms, no other Creature breeds, and I should willingly subscribe to him, but that I think Nature made nothing in vain. Those Fleas seem to be more rare that *India* produceth neer the River *Nigua*, as we learn from *Thever*. They chiefly seize upon the softest parts of the feet under the nails, and bite venomously. After four dayes they raise a swelling as great as a pease, or a Chich pease, and young ones like to white Nits; and if all these be not forthwith picked out, and the place affected burned with hot ashes, the part will be lost, as it falls out often with the Slaves in *Numidia*. He also in the Province of *Peru* was subject to this mischief, and could not recover but by washing himself in the River very often.

L. 9. subtil.

Cardan writes of a little Flea. The *West-Indies*, saith he, brings forth a kinde of Flea called *Nigua*, a very shrewd plague. This creature is far lesse then a Flea, that sticking to a man will so torture him, that some lose their hands, others their feet. The remedy is, to anoynt the part with Oyl, and shave it with a Rasor: To whom *Scaliger* answers thus. Thy story of *Nigua* is lame, yet not unprofitable if you consider Philologie: I shall adde what you have omitted.

Exer. 94. n. 8.
ad subtil. Cardan. 23.

This little Flea hath a most sharp nib, and invades chiefly the feet, (seldome other parts) not only when men goe, but lye down also. Therefore the *Indians* lie high. Most frequently they bite that part which is under the nails. The fourth day the swelling begins to increase, and grows to the bignesse of a great pease. This swelling is full of young Nits; they pick out these, and lay on hot ashes. *Benzo* seems to say the same. The *Indians* are mightily troubled with venomous Insects. Amongst the rest the *Nigua* about the bignesse of a Flea, insensibly creep in between the flesh and the nails especially, and they are bred in the dust. It falls out oft times that no pain is felt by them, till they grow as great as Chich peasen or Lentils; and then with a wonderfull plenty

In Navig. list.

plenty of Nits bred, they are hardly pickt out with a needle or thorn: and this mischief is cured with hot ashes. Moreover, the slaves of *Africa* that the *Spaniards* have in their families, because they go barefoot, are shrewdly troubled with this plague, and they breed such numbers in their feet, that there is no remedy for them but the iron instrument of the fire, whence many of them want their toes or their feet. Fleas will dye from extreme cold, and therefore in the colder winter they are not to be seen; or else we kill them when we can catch them. And one dog will as willingly bite out the Fleas of another dog, as they will scratch one the other. Also most bountiful Nature hath supplied us with a large field of remedies, that the Fleas that hide themselves, and leap away from us, may be destroyed by us, and we preserved from them. For we have herbs, Dwarf Elder-leaves, Fern-root, or Anchusa, flowers of Peninroyal, Rue, Colocintida, Brambles, Oleander, Mints, Horse-mints, Hops, Rape-seed, Cumin, Staves-acre, Fleabane, Conyta, Saffron, Coriander, Celendine, sweet Cods, wilde Cicers, Arsemart, Mustard, Lupins, roots of Chamaelea, Hellebore, leaves of black Poplar-tree, Bayes, Walnut-tree, with the oyls of these, or the boyl'd decoctions, if the pavement be sprinkled, or the house be perfumed, the Fleas will be gone, and most of them are killed. Above all, the dregs of Mares-pisse, or sea-water are commended, if they be sprinkled up and down; also Harts-horn burnt is very good. Goats bloud set in a basin or a pit, drawes all the Fleas to it, as also a staffe anointed with the fat of a Hedgehog or Cony, Ape, Bear, Bull, or Fox, will do the like. The water of the decoction of Arsenick or Sublimate sprinkled is a certain experiment to destroy them. Quicklime mingled with the juice of white Hellebore, doth the same. A Gloeworm set in the middle of the house, drives away Fleas. Fleawort in the City of *Chaire* is powdred, and the powder is strew'd about the beds, which by its smell doth astonish the Fleas that they will not bite. If a Flea get into ones ear, pour in Oyl mingled with a little Vinegar or juice of Rue, oyl of Spike, Turpentine, or oyl of Peter, is very useful. These remedies may serve the turn, which are taken from *Apfyrus*, *Varro*, *Columella*, *Galen*, *Aetius*, *Palladius*, *Avicenna*, *Rhasis*, *Kiramides*, *Guilielmus*, *Placentinus*, *Joanicus*, *Bellunensis*, *Hermolaus Barbarus*, and *Pliny*. The *Barbarians* (saith *Levens*) that the Fleas may not bite them, anoint themselves with oyl that is thick and red, pressed out of fruit, which they call *Conrog*. *Petrus Gallisardus*, *Celius Chalcagninus* and *Tzetzes*, are reported to have written the commendation of a Flea; it was my desire to have seen this, but it was never my chance.

CHAP. XXIX.

Of Insects that want feet, and first of Earth-worms.

SOME earthly Insects that have no feet are bred in the earth, some in living creatures, some in plants. Earth-worms by *Plantus* and *Columella* are called *Lumbrici*, may be from their lubicity. Also they are called the entrails of the earth, both because they are bred in the bowels of the earth, and because being pressed, like the entrails of living creatures they cast forth excrements, also because they are like them in form and fashion. The Greeks call these γῆς ἐντέρας, ἐντέρας *Hesichius*, and the Syracusians, γαστήρας; the English *Meds*, *Earth-worms*; the French, *Vers de Terre*; the Italians *Lumbrichi*; the Spaniards *Lombriz*; the Germans, and those of Flanders, *Erdwurmen*; the Arabians, *Charatits*. *Manardus* writes, l. 2. ep. 4. that Earth-worms were called *Ovisculi*. Earth-worms are greater or lesser.

The great ones, are long Worms, almost like those round ones that are bred in mens bellies, half a foot long, and stretched out a foot long; they are of a weak flesh-colour, and for the most part they have a ring or else a collar about their neck that is thick, wherein there is a little bloud contained: they have no eyes, for no Worms have any. They first breed of putrefied earth, they are afterwards fed by the same, and lastly they are resolved to earth again. Those that you see wreathing little hills at the brink of their holes, as I suppose those heaps are their excrements; for in them we finde nothing but earth, the nutrimental juice whereof being spent, they cast forth the rest as unprofitable matter at their doors, and they are fenced by it against the rain falling in. At night chiefly when it is rainy weather, they willingly copulate, and stick fast till morning. They are not wrapt together in copulation like Serpents, but they stick fast together by their sides, sending forth a frothy kinde of spittle when they copulate: when they are in conjunction, they keep the middle of their bodies, that is the hinder half in their holes, and they are never so fast glewed together, but with the least motion of the earth they can easily part: in rainy weather they are whiter, unless it be when they copulate, for then especially they are red. *Gesner* saith in the middle of *April* he dissected a female Earth-worm, that was very thick, within the flesh through the whole body, a receptacle descends, that is ringed, covered with a thin membrane: when he dissected it, it stank filthily: in this is the earth contained that they take in; but above this receptacle there lie white eggs very many heaped together, next the mouth.

The lesser Worms, for clearer description sake, I will with *George Agricola* call *Ascarides*, they are frequently found in dung-hills, and under heaps of stones: some of them are red ones, they call

call them *Duggs*, and fishers much desire them; some are wan-coloured, others have *yellow tails*, and are so called; some also are with collars and are fat, others without collars and slender, which I take to be the males. These are bred chiefly in Autumn by reason of no plenty of moisture, as *Aristotle* seems to affirm. Both kinds live long in water, but at last they die for want of food. They move from place to place with a certain drawing and pulsation, for the Philosopher saith they do not properly tumble along. The *great ones* live in the bowels of the earth, especially in the open air, and where men oft-times resort. In the morning when they withdraw themselves into their holes, when the air is clear they fence them with earth cast up, but in rainy weather, they stop them by drawing in some stalk, they feed frequently on earth, but most greedily on a piece of white bread unleavened, as I learned from our *Turner*, a very credible man, and have oft-times seen it. Many of them dye if the Winter be too cold, or the Summer too hot. Moreover they are taken by Fishermen, and driven forth of their holes either by digging, and shaking the earth, or by pouring in some liquor of strong juice, as of Walnut leaves, Hemp, or strong Lye. It is good also in tempestuous and dark nights to go into gardens silently, (which they miserably hurt) and to creep upon them when they couple, by the help of fire carried in a horn: for so in one night thousands of them may be intercepted and killed.

The Use.

Uses of this despicable creature are observed to be many; and Nature scarce affords any simple that she hath bestowed more vertues on against diseases. For Earth-worms soften, glew together, ease pain, and by their earthly and watry moisture together, they duly temper the part affected. Powder of Earth-worms is thus prepared: Wrap up great Earth-worms for some time in earth-moss, that so they may free themselves of that glutinous matter that sticks on their outward parts; then press their hinder parts next the tail, that they may cast forth their excrements and be cleansed. Then cast them into a vessel of white Wine and a little Salt, and gently pressing them with your fingers, cast away that first Wine: pour on more, and after the Worms are washed, take some part of this away also: for it must not all be cast away, as some would have it, till it be perfectly clear, for so that glutinous clammy quality would be lost with it. Thus prepared, they must be gently dried in a furnace, till they will crumble into dust when you touch them. Then the powder being beaten and seared (it will smell like Runnet or Cheese) must be kept something far from the fire in a glass vessel. Otherwise it is best to kill the Worms cut in pieces in Wine and Salt, and when they are dead, to take them out and to cleanse them. This powder with the juice of Marigolds, will cure the Epilepsie; with Mead, the Dropie; with white Wine and Myrthe of the Troglodytes, the Jaundies; with boyled Wine, Hydromel, or Wine, the Stone, the Ulcers of the reins and bladder; you may give a dram weight. In three cyathi of water they will break inward Impostumes, and bring them forth, if seven or nine of them be brought into powder. They stay also the Dyarrhoea, help Barrenness, bring forth the Secundine that staves behind, ease the pains of the Hip-gowt, open the Liver, cure Tertian Agues, kill and drive out all Belly-worms, given in liquors or decoctions that are proper for it. Also the decoction of Earth-worms drank with the juice of Knot-grass or Comfrey, is good against continual pissing, especially if it be also cast in by a Clyster. Also a Clyster of their decoction easeth the Emroids wonderfully. Some, where they suspect clotted blood, give the decoction of Earth-worms to drink with great success. For the diseases of the Ears almost past cure, boyl them in Goose-grease and pour that in. Boyled in oyl for the Tooth-ache, and poured into the ear on that side the pain is, as *Pliny* saith, they give ease, or if you drop them into the contrary ear, as *Dioscorides* saith. Thus far for Earth-worms given inwardly, from experience and testimony of *Dioscorides*, *Galien*, *Aetius*, *Agineta*, *Myresus*, *Pliny*, *Vularis*.

Also outwardly applied and bruised, they joyn wounds and neives cut in sunder, and heal them in seven daies; wherefore *Democritus* would have them kept in Honey. Their ashes with old oyl, cleanseth corrupt Ulcers; and as *Pliny* writes, confirms the hard edges of them, if it be mingled with liquid Pitch and Simblick Honey, *Dioscorides* saith *Sicilian Honey* is called Simblick. A certain Chirurgion now in *England* of good note, makes a liniment of Earth-worms and Honey, wherewith he anoints the rent, and sprinkles it with fine powdred Allum, and puts it into a Fistula, and so brings forth the core eaten out with no pain, and heals the wound. Also their ashes drawes forth things that stick within, and laid on with oyl of Roses cures Kibe-heels. *Marcellus*.

Serenus saith, that when the nerves be cut in sunder, it is good to lay on Earth-worms bruised with Hogs-grease that is old and rank. *Marcellus Empiricus* adds Groundsel to the Hogs-grease and Earth-worms, with the tender tops of Box with Frankincense, and this he laies on the nerves cut or pain'd: *Pliny* saith that the ashes of these and of a wilde Mouse, laid on for a plaister, with oyl of Roses, is excellent for broken bones.

For the great pains of Horses in their nerves or joynts, to help them, *Russius*, *Absyrus*, *Didymus*, collect a great number of Earth-worms: whence *Cardan* gathers that they will ease all pains. *Mundella* affirms that contraction of the nerves will be cured if you anoint them with oyl of Camomil that is well replenished with Worms. *Marcellus* saith that the same is done with Honey and Worms, as before. *Aetius* saith, without doubt they are an excellent remedy for the Gowt boyled in oyl, and a little wax: so saith *Marcellus*, but he sometimes mingles Honey with them. *Vigo*, for pains in the joynts, makes a plaister of these and Frogs, to which he adds Vipers-grease.

For pains of the joynts: Take ashes of Worms ii. ounces, oyl of Roses, or Foxes, what may suffice,

suffice, mingle them to an ointment. *Another that is singular:* Take the marrow of a Calfs leg compleat, and old oyl of Roses iij. ounces, Earth-worms cleansed with Wine and Salt ij. ounces, let them boyl in Balneo to the consistence of a Mucilage; with this anoint the neck, shoulders, and the places where the pain is, for it gives great help, *Pliny*. *Marcellus* anoints them with Honey, and then he laies on the Mucilage prepared. When any part is wasted and receives no nutriment, cleansed Worms must be put into a glasse very well luted, that nothing may breathe forth, and so set in a warm oven or in Balneo, and they will then resolve into a clammy moisture; an admirable remedy and approved for the Palsie of the limbs: Take the ashes of tender Earth-worms iij. pounds, Ginger, Galanga, of each iij. ounces, with clarified Honey incorporate them for an Unguent, with this for three nights together anoint the Patient, binding his arms forcibly over his belly or stomach, then cover him warm, and let him beware of cold. *Jacobus de parma* To drive away hoary hairs, women use these ashes mingled with oyl whilst they comb their head, as *Pliny* saith, to whom *Serenus* subscribes in these verses:

*Earth-worms and oyl of Olives, free from cares,
They will preserve a man from hoary hairs.*

We said before how they cure the Tooth-ache. But further the powder of them rubb'd on will preserve the sound teeth, and being injected will make rotten teeth, though it be a grinder, to fall forth; especially, if the tooth be first scarified, and fill'd with powder well sprinkled on it. *Aetius*. *Gal. 5. sec. loc.* bids us do almost the same out of *Archigenes*. Also they are good with the root of Mulberries boyled in Vinegar of Squils, to wash the teeth. For purulent Ears, poured in with oyl they help much, as *Galen* thinks, and cure their inflammations, being boyled with oyl of Roses. *Aetius*.

*If that your hearing fail, an old disease,
Is cur'd with Earth-worms boyled with Ducks grease.* *Serenus.*

Myrepsus bruise Worms with some small quantity of the earth from whence they were taken, and works them together, and anoints that upon ears that are bruised. *Marcellus* bruise them with oyl of Roses, *Celsus* with oyl of Olives. *Faventinus* for pains of the ears anointeth the outward parts with oyl of Earth-worms, and also pours it into the inward parts. *Marcellus* bids to bruise Leeks not planted but sowed, odd in number, and as many Worms together, and boyl these in the best Oyl to thirds, and he saith that this oyl put into the ears is very good for their greatest pains and deafness. *Abinzoar* cures clefts of the hands and feet with oyl of Earth-worms. For an old pain of the head, they are held very excellent bruised with Vinegar, Frankincense, and Castoreum. *Galen* for the same prepares in his *Euporists* such a Remedy: Take xv. Earth-worms, as many grains of Pepper, Vinegar what is sufficient, mingle them, smear them on. *Another*: Take Earth-worms, Mouse-dung, white Pepper, Myrrhe, each half an ounce, bruise and mingle them with Vinegar, and anoint that part of the head that the pain lies on. *Myrepsus* will have the Worms to be odd, and to be taken only with the left hand, and so superstitiously anointed. If thou wouldst try, saith *Marcellus*, whether a swelling in thy neck be the Kings-evil, lay a live Worm upon each swelling: if it be a scrophulous tumour, each Worm will turn to earth; if not, he will be alive and receive no hurt: so saith *Pliny* also. Earth-worms are a part of that noble Plaister of *Arnoldus* (2 *Breviaris*) of a Rams skin, or the blood of a man that is red, against the Rupture: and *Hollerius* commends it to cure *Enterocoele* and *Epiptocoele*. They also diminish the Stone, both taken inwardly, as also anointed on the shere somewhat thick. *Gal.* What concerns womens diseases, bound to the neck they retain the birth, but contrarily applied to the hips, they draw the birth out and the secundine, for they draw mightily wheresoever they are applied living. *Pin.* Inflammations of the breasts, Earth-worms alone laid on will cure, for they concoct, open, draw forth, and heal. *Alex. Benedict.* So *Myrepsus* makes a plaister of them bruised. Lay on Earth-worms with Quinces, or with dried Barley flour, upon Breasts hardened or inflamed. *Aetius*. But if after delivery womens breasts swell, and to use the words of *Serenus*:

*If the swoln breasts do feel great pain,
Smear them with Earth-worms 'twill help them again.*

For they will concoct the Impostumes and suppurations of the breasts, and after concoction will heal them and void out the matter. For the Shingles, the *Indians*, saith *Carolus Clusius*, make an unguent thus: Take Earth-worms, and feed them some time with leaves, fine flour, or flour and milk, and when they are grown fat, boyl them in an earthen vessel (alwaies schimming them) when they are strained, boyl them again to the consistence almost of a plaister, which well prepared will be almost of a yellow colour; dissolve some part of this in distilled water of Roses, and wash the part affected with it twice a day. A most excellent remedy, saith *Clusius*, and proved by very long experience. *Pliny* saith they will do the same in Vinegar, who together with *Aetius* and *Myrepsus*, affirms that Worms bruised and laid on the place a Scorpion hath stung, are an admirable remedy, for they presently ease the pain, and correct the malignity of the tumour.

Oyl of Earth-worms is known by all to be good against divers infirmities, and the Ancients made it thus. Take Earth worms half a pound, Oyl of Roses, Omphacine, two pound, the best white wine two ounces, let them boyl in *balneo* till the wine be consumed. This cures the nerves relaxed, contracted, astonished, cut in sunder, or cooled, it easeth almost all pains, and waists the stone, being anoynted on the share and loins. But in the preparing of it, every man follows his own opinion. For some before they adde Oyl, wash and purge them with white wine, some neither wash them nor presse out the earth, and perswade to take the best wine, that it may penetrate the sooner: Others use simple Oyl, not Oyl of Roses, others again Oyl of Chamomile. Also they shew us many wayes to boyl them, for one useth a furnace, another *Balneum*, another doth it in dung, and some mingle of Chamomil flowers, and of Dill, to assuage pains, some of Hypericon flowers to glew wounds together, others Snails without shells, others with shells, every one as he thinks fit. The Author of *Bartapalia* prepares an admirable water of Worms, fol. 254. that is very good for wounds and diseases both outward and inward. For Worms of Horses and Oxen. *Pelagonius* puts live Earth-worms into their nostrils, yet it were far better with a horn to put them down their throats into their stomachs. *Tardius* bids give ashes of Earth-worms bruised with flesh to a Hawk, when she cannot mute. They are also meat for Moles, and when they dig, they will break out of the earth in wonderfull haste. Sows (as *Varro* writes) will trouble the mud, and dig up the earth with their snouts to feed on them. *Albertus* saith that Toads, *Bellonius* Lizards, *Tarentinus* that Sea Grampets, and experience saith, that Frogs, Eels, Gudgeons, Carps, Roches, Trouts, Darcæ, and Tenches will greedily devour Earth-worms. Also that bird *Aristotle* calls *Αἴξ*, some call it *Vangellus*, and Hens, and all Quails will feed on Worms. But those are no wise Fisher-men, that cause Worms to come forth with medicinal juices, for when they are bitter the Fish will not bite, but if they lie a day in Wheat-meal and a little Honey, and then put upon the hooks, they relish better then *Ambrosia*: And it is no ordinary good we may receive by them, that they foreshew rain when they suddenly come forth of the earth, but if they lie hid the night before, it is a sign of fair weather. Some do harden Iron like Steel thus. Take Earth-worms two parts, Radish-roots one part, bruise them, and distill the water in a Limbeck. Or take distilled water of Earth-worms three pound, juice of Radishes one pound, mingle them, let Iron hot be often quenched in this water, and lie in it ten dayes, and it will grow very hard. Another. Take Earth-worms two pound, juice of Radish one pound, distill them at an easie fire, and temper your Iron with this distilled water. Also draw forth juice of Sorrel, stinking Hemlock, and of round *Aristolochia*, of each alike, and temper your steel often. The juice of Sow-bread is thought to do the same. Mr. *Fakenham* a famous Physitian writes thus. Another. Take Goats blood, adde to it a little salt, let glased pots be buryed in the earth, well luted for thirty dayes, then distill the blood in *Balneo*, and put as much of the distilled water to the same quantity of the water of Worms. Another. Take water of Worms, Rapes, roots of Apple-trees, each alike, distil them apart, and mingle equal quantities together, and quench your Iron in that water, as we said before. A Frenchman namelesse.

CHAP. XXX.

Of Worms in living Creatures.

The Name.

Isidorus thinks they are called *Lumbrici* from *Lumbi* the loins. For the Ancients call the belly *Lumbos* and *γαστήρ* by *Hesichius*, and *Suidas*. Some interpret that, those that are sick of Worms. But more rightly from Earth-worms, which they represent in form and nature, doe they borrow that name. *Cornelius Celsus* calls them Worms, *Pliny* the living Creatures of the entrails. The Greeks call them *ἐλμυνδεις*, *ἀλμυνδεις*, *ἐλμυεις*, *ἐλμυρες*, *δελμοι*, and when they are extraordinary great, *βελία*, as appears out of *Aelian*, l. 9. c. 33. You must observe, that Latin writers make difference between *Vermes* and *Vermia* or *Verminationem*, that is Worms, and diseases from Worms in the belly; for *Vermia* and *Verminationem* are the pains of the belly from Worms, as *Celsus*, *Serenus*, *Pliny*, and *Seneca* Epist. 97. testifie. The Arabians call them *Emicar*, *Sylvaticus* *Elingen*, the Germans *Spulwurm*, *Bauchwurm*, the English *Gutworm*, the Slavonians *Sskrkawka*, a word hard to be pronounced. A belly-worm is a living Insect, without feet, bred in the bodies of living Creatures, hurting their operations diversly. I said a living Creature, that I might exclude those broad Worms called *Tenia*, which though they be of substance that grows to the guts, and are in form like to living Creatures, yet they cannot properly be accounted living Creatures, as *Hippocrates* l. de morbis, rightly affirms. I said an Insect, both because they are of a round body, and because the Ancients do not reckon them amongst Serpents, nor have hitherto ranged them into any proper Classis. I said without feet, that I might distinguish them from Worms with feet. I said bred in the bodies of living Creatures, because they are not only bred in the guts of living Creatures, but in all the fleshy parts, and in the heart it self, as it shall appear by the history. And not only men are troubled with them; but also Horses, Calves, Dogs, Hogs, Hawks, and all perfect Creatures. I said that diversly hurts actions, because from them, pains, Consumptions, Convulsions, Epilepsies, Frenses, and divers other mischiefs follow, especially if they be very great, or very many.

The Description.

And all these Worms breed either in parts that are alive or dead. The worms in living Creatures seem to be of three sorts, the *round Worms*, *Gourd-like Worms*, and *Ascarides*, such as are bred often in the Intestines of living Creatures: And not there only, but in other vessels and bowels; of which matter I finde there was a great controversie amongst the old Authors. For *Galen* *l. 1. de loc. aff. c. 5.* assigns certain diseases to certain parts, as worms to the guts, the Stone to the reins and bladder. But I my self with many other persons of the University, saw a stone as great and like a Pigeons Egge, voided by stool, at *Cambridge*, by *Dr. Larkin* the Kings professor in physick, who was long tormented with a pain of the Colick, and waiting, and he voided that stone in the same form and magnitude, as a most troublesome birth at his fundament. *Montanus* and *Benivennius* write that they saw the like. Also by giving but one Clyster to the choise wife of noble *Leonardus*, I brought forth 35 stones like to Medlar seeds, at one time in the year 1583. Many there are that question the credit of *Pedemontanus Arculanus*, *Guainerius*, *Trallianus*, *Benivennius*, and *Montanus*, because (besides the opinion of *Galen*) they have written that they have more then once seen stones in the head, lungs, greater veins, the gall, bladder, under the tongue, in the joynts, and belly. But since daily experience doth clear them from a lie, we may say that the *Greek* speak, as *Greeks* were wont to doe, but that these men speak but the truth. *Galen* might have remembered, that *Hippocrates*, *Epid. 5. sec. 12.* did not rashly affirm, that there was a sharp stone pressed out of a womans matrix, by the hand of the Midwife, as great as the whirle of a Spindle. This I thought fit to premise, lest when I shall report them, the faith of others and my own experience that worms are bred almost in every part, others should think I relate either a thing very strange, or what is false. Worms seldome appear in the most vehement pain of the *Hemicrania*, yet *Hellerius* teacheth that it so comes to passe sometimes, *l. 1. c. 1.* The *Polonians* call this disease *Stowmy Roback*, the *Germans* *Hauptwurm*, and it was formerly frequent in *Germany* and *Hungary*, and all that were taken with it fell into the frenzie, or madnesse, and when they were dead, and their brains were opened, a Worm was found there. Then the Physitians gave Garlick with distilled wine once or twice a day, and all that drank of that recovered, the rest dyed. *Philip Shot* cured five of his servants that were sick of that disease, with the same remedy, as one writ in a Letter to *Gesner*. That Worms are often seen in the brain, *Thomas a Vega* saith, *com in cap. 5 l. de loc. aff. Galeni*, and *Balthasar Conradinus* *c. 10. de feb. Hungar.* Also *Cornelius Gemma*, in *Appendic. operis Cosmocratic.* disputing of a pestilentiall Semitertian, speaks of a woman in a city neer the river *Mösa*, that had a long and vehement pain in her head, when she was dead of it her brain was opened, and there was found a great quantity of filth, and abundance of Worms. That disease is known saith *Rhasis*, by the internall corroding of the forepart of the head, and by the most vehement pain, that almost makes them mad. It is cured by neefings, and juices cast up into the nostrils, that wil kill Worms. *Rhasis*, *l. 1. c. 9.* But the Worms that are yearly found in the brains of Stags, and sometimes of Goats, Sheep, Rams, (chiefly those that are fat) that Hunters and Butchers know better, than that I need to tell them. They are as big as the greatest Worms, and of the same form with them, as *Alexander Benedictus* and *Matthiolus* report. *Theophrastus* mentions these *Hist. lib. c. 53.* and *Alexander Trallianus*, *l. 1. c. 15.* It is reported that *Democritus* of *Athens*, when he was young was troubled with the Falling sicknesse, and he went to ask counsell of the Oracle of *Apollo*, and *Apollo* answered him thus:

Take a tame Goat that hath the greatest head,
Or else a wilde Goat in the field that's bred,
And in his forehead a great Worm you'l finde,
This cures all diseases of that kinde.

The young man was much troubled at this answer, and he repaired to *Theognostus Democratus*, that was then ninety yeers old, to tell him the meaning of the Oracle. This *Theognostus* told him that nothing could be plainer, for he had learned by long experience, that there were Worms in the heads of Sheep and of Goats, that being wrapt in a black Sheeps skin, and hanged about ones neck, would miraculously cure the Falling sicknesse. Some write, as *Pliny* witnesseth, that two Worms are found in the head of a downy *Phalangium*, which Worms bound up in a Deers skin, and bound to a woman before the Sun-rising, would hinder conception. Concerning Worms of the Abdomen. A woman, saith *Pemius*, that I knew very well, told me that she had seen more than once, some round Worms, that crept forth of the belly by the Navel.

The Ancients also say, that oft-times Worms will breed in the ears, against which they prescribe these remedies. Take the juice of wilde Cucumbers, and the juice of Garden-sage, or that with broad leaves, mingle them both alike, and pour that into the ears. *Gal. l. 3. sec. loc.* where reckoning up the Compositions of *Andromachus* for the ears, he highly commends this of *Pritanis* and *Harpalus*. Take Opium two oboli, Myrrhe, Spikenard, Saffron, of each three oboli, burnt brasse five oboli, and of round and *Sicil Alum*, each one dram, black Hellebore two drams, mingle them with sod wine or Oyl of Roses, and apply them to the ears. *Lib. Euporist. 2.* he writes, that a Locust will destroy Worms in the ears, and he bids apply a sweet Apple to the ear, with a hole in it almost quite through, for the Worm will come forth, enticed by the sweet smell of it. *Pliny* much commends the root of Cypressse boyled in water, and the urine of a young boy, and the juice of Hemp, Rue, Bramble, and of Capers powred in. Lastly, many remedies may be fetcht from

Columella, Vegetius, Marcellus Empiricus, Trallianus, Vigo, Tardius, and all the *Arabians*, and therefore here I supersede, passing on to other matters. *Monardus* prescribed to one that had a Polypus in his nose, the juice of Tobacco to be injected; whereby the Ulcer was purged, and many little Worms came forth: Wherefore they breed also in the nostrils, (for all the Arguments that *Gabucinus* hath alleadged against it) and are not only cast forth of other parts. Cow-herds know that Worms will breed under the tongue, and the Worm under a Dogs tongue (the carrying of which Worm about one, saith *Pliny*, will drive off the biting of a mad Dog) doth prove that sufficiently: And *Valescus* saith he hath seen Worms under mens tongues. It is known sufficiently by experience, that the very Breast and Lungs are not free from Worms; *Antonius Benevennius, Benedictus Renius, Mundella, Antonius Siculus*, are my witnesses, who have seen them cast up, not by vomit or reaching, but even by coughing. Also *Alfaranius, Capite de Tussi*, writes, that sometimes a cough is caused from living Creatures bred in the hollow of the lungs, and cavity of the breast, which being no greater than little Lute-strings, yet when they creep from place to place they make one cough, and when they lie still it ceaseth. Also *Abenzoar Abhomeron. lib. 1. tract. 11. c. 3.* makes mention of them, affirming that the old Physicians saw and writ of them. *Albertus* and *Gentilis* saw some in the liver and spleen, and *Platerus* in the gall bladder. Wherefore, whatever *Galen* or *Avicenna* may say to overthrow this from the perpetual motion of the Lungs, the nearness of the heart, and other frivolous Arguments, yet there is no man but will say, but that reason must give place to sense, especially in natural things. There was saith *Hieronymus Gabucinus*, a certain Noble woman of *Fanes* (in his Comment of Worms, to which we are indebted for the great part of this history) when she had a long time been tormented with pain of her stomach, at last she cast up a ball of hard flegme, this being dissected, it seemed like a piece of flesh, and in that there was a Worm, and thus the woman recovered, whom the neighbours thought to be bewitched. Of Worms of the Reins and Bladders. When the reins putrefie, or the muscle of the bladder, oft-times little Worms are cast out, concerning which I thought good to write these histories out of *Pennius*. A woman thirty six years old, had great pain of an Apostume in her reins, and she consumed, at length she cast forth little Worms, a fingers breadth long, which I first saw in the bottome of her urine, Anno 1582. *Randolph* a London Physician, very learned and pious, when he looked on at the dissection of the body of one that was dead of the Stone in the kidneys, he found in one of the kidneys that was corrupted, it was wrinkled and putrefied, a Worm of a full length. *Timothy Bright*, a very skilful Physician, and to whom we are much indebted for the Epitomie of the Ecclesiastical History, saw a Scholar at Cambridge when he lived there, that pissed out a Worm an inch and half long; but it was not without feet as Worms are, but it had many feet and was very nimble. *Aloysius Mundella Medicina Dialog. 4. Argenterius cap. de vesic. morb. Rondeletius lib. de dign. morb. c. 17. Scholiasies Hollerii lib. de morb. int. cap. de vesic. affec.* (to say nothing of *Levinus Cardan*, and my own experience) do sufficiently testifie that such Creatures breed also in the bladder: That Worms come forth of the matrix, like to *Alcarides*, I did not only see at Frankfurt in a German woman, at eighty years of her age, but *Aloysius* confirms the same in his Epistle to *Gesner*, and *Hippocrates 2. de m. mulier.* and *Avenzoar. lib. 1. tract. 2.* have said the like. *Kirandis* writes, that there is a Worm to be found in the matrix of a Mule, which tied to a woman will make her barren. In India and the Countreys above Egypt there are some living Creatures like to Worms in form, (they are commonly called Dragons) they are in the Arms, Legs, Shanks, and other brawny parts, also in young children, they breed in secret places under their skin, and more apparently: When they have staid there for some long time, at some end of this Dragon the place comes to supputation, and the skin being opened, out comes this Dragons head. *Paulus lib. 4. c. 59. Soranus* granteth this, but he questions whether they be living creatures. Moreover, in the bloud it self some living creatures breed, like to Worms, that feed on the body, as *Pliny* writes, *Hist. 26. c. 13. Plutarch 8. Sympof.* who writes, that a young man of Athens voided Worms with his seed. *Egineta* saw them come forth at the groins and buttocks, as he saith *lib. 4.* to whom *Benevennius* subscribes c. 100. Also they breed under Sheeps claws, (saith *Columella*) and such I have seen under the nails of those that were troubled with a Whit-flaw. And thus farre concerning Worms in the bodies of living Creatures. But such as breed in dead and corrupt bodies, (whether it be from the disease or the Chirurgeons fault) want a Latin name, but the Greeks call them *Eulas*, as appears by *Hippocrates*. The English call them Maggots. *Calim* would also have them called *Eulas* in Latin, borrowing the word from the Greeks. We will speak of these in order. And first concerning Worms of the guts, the descriptions whereof, the causes, signs, symptomes and cure will bring much light to the History of the rest.

Remember the Cook of Queen Mary that cast out a Scolopendra by her nostrils, &c. Mr. Crane.

See de Vera Medend.

CHAP. XXXI.

Of the Description of Worms in the Intestines.

WE shewed before that there are three sorts of Worms that are bred in the guts. It will be worth our labour to describe what each of them is. The round Worms are the first difference, and that manifest to all men, because these are the most common, and are so called, because they are indeed round and smooth, not unlike to those worms that breed in dunghills and gardens, which we said before are called by the

the Greeks, the bowels of the earth. These as all other Worms are blinde, without any eyes, and they are a hand length or something more: yet *Benevennius* c. 2. affirms that a Smith did vomit up a Worm with grosse flegm, almost a foot and half long, very plain, with a red head that was smooth, and about the bigness of a pease; but the body of it was downy, and the tail crooked like the half-moon. Also at *Rome*, anno 1543. one that was now upon his youthful years, when as for many daies (as *Gabucinus* tels the story) he had been in great torments of his belly, at last he voided by stool a great black Worm with black hair, five feet long, as big as a cane. He saw one also that did not exceed the hands length, like to the round Worms, but that the back of it was hairy, and set as it were with red hairs; but this being cast forth by using good remedies, he grew very well. One *Antonianus* a Canon (as *Hieronymus Montanus* tels the story) voided a green Worm, but he died shortly after he had voided that. But for the most part they are smooth and not hairy, a hand long and not a foot, at both ends pointed, as it were with a nib. And they differ so far from Earth-worms, that they wear no collar nor girdle: what concerns their colours, I have seen some red, yellow, black, and partly white, or gold colour. Green ones are seldom seen, yet *Montanus* saw some. Gourd-worms are those quick Worms that are like unto Gourd-seeds; concerning which the question is so great between *Gabucinus* and *Mercurialis*; for when he treats of a broad Worm, that is made of an infinite number of Gourd-seeds shut up in a skin; he saith thus: I, saith he, think a broad Worm to be nothing else but, according to *Hippocrates*, as it were a white shaving of the guts, that comprehends all the intestines, between which some living creatures are bred like unto Gourd-seeds: which may then be seen to be voided when all that shaving is voided, yet oft-times it is voided by parts: which if they break when they are voiding, then you may behold these Worms like to Cucumer-seeds voided by themselves, sometimes many of them being folded together, sometimes but a few. But if any man shall see all that portion, let him know, that that scraping off like a Worm doth not live, but the creatures that are in it, like Cucumer-seeds. I once saw this Worm called a Broad Worm that pants, to have been of a wonderful length, and it crawled, a woman in a Quotidian Feaver voided it by siege, and when I did with admiration much view it, and sought to finde the cause of its motion: that other man, who said he voided a portion of a broad Worm some daies before, which he would shew unto me for a wonder, did shew it me with incredible desire I had to see it; for this portion did move it self, whence I was more desirous to know the cause of that. At last searching diligently, I observed through the whole hollow part of it, a rank of living creatures like to Cucumer-seeds, which crept forth of it as out of some bed, sometimes one, sometimes two folded together, oft-times four, or more, and that part of the shaving of the guts that was empty of these creatures did not move at all, but sank down: whence it comes to pass that I think a broad Worm is nothing else but snotty matter bred between the guts, or snively flegm thickned by the coldness of the guts, covering the inside of the guts like a coat, which women that assist the sick call a bed of Worms. Out of which snotty matter little living creatures like Gourd-seeds proceed, as by way of a conception, which is covered all over by the second membrane in the womb which is first made of the seed. So saith *Gabucinus*. *Avicenna* agrees in this opinion, *Fen. 16. tract. 5. cap. 2.* the Gourd and broad Worms are bred from the clammy matter that is fastned in the superficies of the guts, which is comprehended by a flegmatick pannicle covering it as if they were bred from that, and did putrefie within it. *Antonius Benevennius* a Florentine saith the same, and more clearly, in *com. de mirand. morb. causis*, c. 87. who writes that in the mineral Baths at *Avignon*, that are in the Countrey of the *Senones*, he saw a woman that for seven daies together drinking the water, did void these Gourd-worms in abundance, that stuck so fast together, one being close to the other, that they were in a rank that was above four cubits long, yet you would judge them to be but one body and one Worm. *Johannes* a Bookbinder at *Basil* (whilest I studied Physick there in that Academy, under *Zuingerus* and *Platerus* my Masters, anno 1579) voided such a Worm ten ells in length without any pain, and not many years before he had voided the like. It consisted of many Gourd Worms; without which it had had no motion nor feeling, and might deservedly have been rejected from the number of living creatures. *Platerus* had such a Worm dried that was eighteen ells long, I saw it. *Pliny* writes of a Worm a sick person voided, was three hundred foot long: wherefore whatsoever *Mercurialis* objects to the contrary, *lib. 3. de morb. puer. cap. 7.* since experience proves the thing, is without any firm ground. He saith it cannot be that any living creature can produce so many young ones, as there appear like unto Gourd-seeds; then, that the guts are not large enough to receive so many young ones. Thirdly, that this comes to pass by reason of the violent putting them forth that gives the form, because the young one being broken by coming forth, is divided into those many pieces like Gourd-seeds. And hence we may conclude that those are trifles that the *Arabians* speak of Gourd-worms, forasmuch as there are none such: What is that I hear, most learned *Ferome*? that thou being gray headed, and taught by long experience, shouldst so applaud thy own imagination, that thou shouldst dare to deny a thing obvious to sense, and plain to our eyes, and to *Gabucinus Benevennius*, and the *Arabians*? Go to, No living creature can produce so many young ones like Gourd-seeds: why not I pray? when as one maid that took physick to kill Worms, as *Gabucinus* affirms, voided 177 round Worms? To say nothing of that *Benevennius* reporteth c. 85. of the incredible multitude of them: and he was a man to be believed. And what thou speakest of the capaciousness of the place, if that be an argument, it is an error to be laughed at.

For the guts will contain not only as many as are in a Gourd, but the Gourd it self prepared. By thy last objection thou dost but mock, but canst not weaken the opinion of *Avicenna* and the *Arabians*: for as much as in bodies dissected, Gourd-worms have been seen wrapt up in a roll, wherefore they took not their Gourd-form from the violent voiding them at the fundament, or from the manner of putting them forth, as thou either inventest maliciously, or ignorantly believest. I conclude therefore with *Gabucinus*, that there are Gourd-worms, and the broad worm called *Tenia*, is not properly a Worm, nor yet a living creature, but something about the entrails like white shavings, as *Hippocrates* saith, that is filled with these Gourd-worms put in fashion of a coat of Mail. *Ascarides* have their name from *αἰσίν*, because they bite and tickle very much, and so exercise the patients that are troubled with them: others derive them from *αἰσέω*, which signifies to move. The Ancients called them Beasts-worms, because they were seldom found in men, but often in Horses, Dogs, Hens, and Oxen. And they were so seldom seen in men, that *Hippocrates*, and *Celsus* that followed him, either knew them not, or thought them not worth the mentioning, and so they said nothing of them; and yet they writ at large of other Worms. They are like the round Worms, but ten times shorter, (for they are seldom above an inch long) and what length soever they be, they are thicker at the end of the longanum, and the sphincter of the anus they are found, causing a vehement itching in those parts. *Galen* writes in *Lib. de Ling. Hippocratis*, that *Gous* an old man called *Ascarides* long Worms; which difficulty *Mercurialis* easily opens, for we should read it, saith he, not *μακρὰς*, great, but *μικρὰς*, small. Moreover, though in consideration of their breadth and thickness they seem long; yet compared with round Worms, they may be called short. These and round Worms are of divers colours, as the matter they are bred of is, or in respect of the heat that concocts them; but Gourd-worms are alwaies the same: whence I should conclude that Gourd-worms breed only from flegm, but the rest from all humours and excrements. *Ascarides* oft-times come forth in great numbers, and before they be voided they prick much.

CHAP. XXXII.

Of the Original of Worms in the guts.

Aristotle lib. 5. *Generat.* and *Hippocrates* before him, 4. *morb.* make the material cause of Worms to be dung. *Oribasius* l. 3. *Aph.* 30. and *Montanus* that followed him being his Master, thought that living creatures might breed in the guts from all kindes of humours: and *Mercurialis* who thought they were deceived, was blinde himself at noon-day. But let us examine his Arguments: It is found, saith he, that they will not breed from blood, because blood never putrefies so much, that living creatures may breed from it; Also he affirms from the judgement of *Alexander Trallianus*, that living creatures cannot breed in the veins. But experience cuts off the nerves of his first argument; and the Authority of *Rhazes*, *Loppius* and *Pliny*, overthrow the second. Also they cannot breed of a melancholy humour, because it is cold and dry; nor of yellow choler, because it is bitter, and such creatures are not fed by bitter things, but destroyed. For which opinion, though he urge *Aristotle*, *Hippocrates*, *Galen*, 4. *sumpl. med.* *Ægineta*, lib. 4. c. 27. yet what is there more slender than the opinion of them? For Butchers know that in the milks of Sheep, which is the fountain of melancholy humour, and in the gall of Oxen, which is the receptacle of bitter choler, innumerable worms are oft-times found. And I see no reason why Worms may not breed from yellow choler, as well as in Wormwood; from melancholy as well as in stones, from blood as well as in sugar. But if they be not bred from them, whence have they matter that they breed of? The Physician of Padua will answer, *It remains therefore that they can breed only of raw flegm*, which either ariseth from too great quantity of the best meats for want of heat, or quantity of bad meats corrupt by depravation: which opinion, though it well agree with *Galen*, *Ægineta*, *Aetius*, *Avenzoar*, *Avicenna*, *Columella*, *Celsus*, *Alexander*, and chiefly with our *Mercurialis*, yet in my judgement *Hippocrates* is in the right, who thought that living creatures are bred in the little world, as well as they are in the great. Therefore as in the earth there are all kinde of humours, heat and spirit, that it may nourish living creatures that breed, so hath man all kinde of moisture that nourisheth things that breed. Moreover, when as these living creatures do represent perfectly Earth-worms, no man in his wits will deny but that they have both the same original. What flegm is there in the earth? yet it breeds round Worms, and Gourd-furnished, and *Ascarides*, and all sorts of Worms, and the best and warmest earth abounds with them, so far is it that they should breed only of raw and corrupt humours. Do we not also daily see that Worms are voided by men that are in health? For I knew a woman of Flanders, that at *Frankfort* on the *Main*, which from her youth till she was forty years old, did daily void some round Worms, without any impairing of her health, and she was never sick of them. I conclude therefore that from every raw humour of the body Worms may breed; and not only from crude or corrupted flegm. The formal cause depends from internal heat, which is weak, gentle, pleasing, and fit to breed living creatures; wherein that plasticke force of *Caleodick* Nature, (to use the word of *Avicenna*) doth make the colours by the degrees

grees of secret heat, and sporting her self doth make that broad form of Gourd-worms, and sometimes of Lizards, Toads, Grass-worms, Caterpillars, Snakes, Eels, as we read in Histories. This doth give them taste, feeling and motion, this gives them that force of attracting, whereby they forcibly draw forth with greediness the juices that slip into the guts. If it were not so, that heat that consumes all things might perhaps dispose the matter that is changed by putrefaction, but it would never give the form and figure of a living creature. For it is not because the guts are round, that round Worms are bred in them, as some men dream; but the external form depends from the internal, and the spirit drawn forth of the bosome of the soul it self, doth frame the shapes without a Carver or Smith. This spirit is the mediate efficient cause: but God himself is the principal cause in this and other things, in whom, as well as we, the Worms are, move and have their being.

The final cause shewes their use, which declares Gods omnipotency, Natures majesty, and the singular providence of both for mans good. For there are collected in us some putrefied excremental superfluous parts, which the more bountiful hand of Nature changeth into Worms, and so cleanseth our bodies; as we account it a good sign of health to be full of lice, after a long disease: also they consume much superfluous moisture in mans body, and unless they grow too many (for then they feed on our nutrimental juice) they are a great help to the guts; so far is it that they should be accounted by physitians amongst diseases, or the beginnings of diseases. Amongst the concomitant causes I reckon the place and the countrey. For though they are more common to children than to those that are of years, to women than men, in a pestilential than a healthful time, in Autumn than in the Spring, to such as use an ill diet rather than to those that keep an exact diet: yet they accompany all ages, sexes, conditions, seasons, diets; for no man is privileged from them, yet some places or climates are free, for according to the nature of them, in some many, in others no Worms will breed: for all kinde of Worms will not breed in each part of the guts, but round Worms only in the small guts, Ascarides in the Longanum, the Gourd-worms only are bred in all. Also, as *Theophrastus* and *Pliny* testifie, there are no small differences amongst Nations and Countreys. (*lib. hist. pl. 9. c. 2. Lib. Nat. hist. 27. cap. 13.*) For broad or Gourd-worms are common amongst the *Egyptians*, *Arabians*, *Syrians*, and *Cilicians*: again they of *Thracia* and *Phrygia* know them not. And though the *Bæotians* and *Athenians* are under the same Confines, they are frequently full of Worms, and these are by a privilege as it were freed from them. He only will admire at this, or think it a Fable, who knowes not that the nature of Countreys vary according to the position of the stars, the nature of the winds, and the condition of the earth. There is a River (saith *Aristotle*, *lib. de nat. anim. c. 28.*) in *Cephalenia* that parts an Island, and on one side of it, there is great abundance of Grasshoppers, but none on the other. In *Prodolesena*, there is a way goeth between, and on one side of it a Cat will breed, but not on the other side. In the Lake *Orchomenius* of *Bæotia*, there are abundance of Moles; but in *Lebadius*, that is hard by, there are none, and brought from other parts they will not dig the earth. In the Island *Ithaca*, Hares cannot live; nor in *Sicily*, flying Ants; nor in the Countrey of *Cyrene*, vocal Frogs; nor in *Ireland*, as we know, any kinde of venomous creature. The reason of all this he can only tell, who hath hanged the earth in the air without a foundation; for it is not my eye that can see so far, nor have I any minde to affect to know things above my understanding.

*I leave that work to those that dare aspire
To know Gods secrets, let me them admire.*

CHAP. XXXIII.

Of the signs and cure of Worms out of Gabucinus.

Let us therefore shew the signs of Worms, beginning from those that are called round Worms; both because these do more frequently vex children, and because they produce more cruel symptoms: of which *Paulus* writes thus: they that are troubled with round Worms, are cruelly torn in their bellies and guts; and they have a tickling cough that is troublesome, and somewhat tedious, some have a hickop, others when they sleep leap up, and rise without cause; sometimes they cry out when they rise, and then they fall asleep again; their Arteries beat unequally, and they are sick of disorderly Feavers, which with coldness of the outward parts come thrice or four times in a day or a night without any reason for them. Children will eat in their sleep, and put forth their tongues, gnash their teeth, wink with their eyes, they will be very silent, and are angry with those that rowse them up, the barks of their cheeks, in a short time, are sometimes red, sometimes wan-coloured. If the Worms run up to the stomach, they cause nauseating, gnawing, and want of appetite; and if the sick are forced to eat, they scarce can swallow it, and if they swallow it down, they vomit it up again, they void many corruptions of meat by their bellies, and they are swollen like a drum, the rest of the body growes unreasonable lean, not by reason of hunger, nor immoderate evacuations. These things happen when these creatures creep and gnaw in the belly. A feaverish heat sends up ill vapours to the brain,

brain, that arise from putrid moisture collected in the stomach. So writes *Paulus*. But *Aetius* out of *Herodotus* writes thus: Those that are troubled with Worms have a most cruel pain of their stomach and bellies, and they have a little frequent tickling cough, and yet they spit up nothing; in their sleep they shiver, and rise preternaturally; some again put out their tongues and shut their eyes, and are silent, and cannot endure to be rowled, and cannot watch for weakness: some have their eyes bloudshed, their pulses unequal, obscure, deficient, and recurrent: some want an appetite, children whilst they sleep, bite their tongues, and move their mouthes as if they sucked, or eat meat. But these things are done for a short time, and by circuits. Moreover some children besides reason, rise with crying, and presently fall down again: some crash their teeth, which it seems happens when the Worms suck, and gnaw their bellies and guts. And now it appears that some are come up into the stomach, and cause loathing, and bitings: oft-times also by themselves they are cast upward, but sometimes with some flegmatick humour. Some Infants neglected lose their motion, and are benumbed, and like those that are in a swoond, they sweat a cold thin humour, and most commonly they are wan-coloured: sometimes the face will be red, especially about the cheeks, but this colour again is changed into more than ordinary paleness. Others again like dotards speak strange words in their sleep, others change their places they ly on, still sleeping, and they are vexed, and turn from place to place: but very few of those do cry, for most of them are void of reason, and are silent. Also they that are vexed with round Worms, loath their meat, and if they eat any thing, they cast it up again, or loath it so much they can hardly swallow it: for they fall into Feavers with vehement cold in the outward parts: some have their bellies swoln like a drum. So saith *Aetius*. But these are the marks he reckons from *Hippocrates* opinion: Worms in the belly are discovered by these marks: If they be sleepey, and the disease will not let them, and their outward parts be cold, and there be gnawing at their hearts, the urine troubled, and the tongue full of moisture; also they that have Worms in their stomach, are full of spittle; and if any little Worm comes forth they spit no more: therefore all those that have Worms in the mouth of their stomach, do commonly cast them up all by vomit, but those that have belly Worms, void them by siege. But they all nauseate, and vomit up what they take in. They are like to those that are pricked, that have contractions all over their bodies, and move suddenly and confusedly, and they have torments and pains of their guts. Vapours carried to the head cause Vertigoes. Moreover the manner of diet that the party used will shew the generation of Worms, and all the rest. These are the signs of round Worms; but all these signs must not be sought for in every one, as *Paulus* saith; but some and the principal of them. I might joyn here many things out of our new writers, unless what they say, and more also were not to be found in *Avicenna*, whence they borrowed it.

Signs of broad
Worms.

Paulus gives us these notes of broad Worms: sometimes they abound in those that have Feavers, and sometimes in those that have none. In Chronical diseases, they breed, gnawing the stomach, and causing a greedy appetite. They eat the meat so fast, that we need more, and if it be not present, they bite shrewdly; the body growes lean and weak, and unequal. But the most certain sign is, that some bodies like Gourd-seeds come forth with our excrements: so saith *Paulus*, and *Aetius* doth not differ from him, but that he saith, that they gnaw the stomach continually, and cause an insatiable appetite, and that the meats eaten soon turn to excrements. They that are affected grow weak of body and sluggish, and are alwaies hungry, for what is living in the guts, when it hath consumed the meat, feeds on the body; but this sign will not fail us, if some things like Gourd-seeds be voided by stool. The signs *Hippocrates* gives are these: He writes after this fashion: There is another kinde of this, that comes forth like the white shavings of the guts; which hath these marks: The party voids seed like Cucumer-seed, and when he is fasting he is vexed, and spits much, his liver being affected, sometimes not; and sometimes when this vehemently affects his liver, it stops his speech, and he spits much, and after that it stops: and sometimes there is great pains in the guts, sometimes the shoulders ake, and then it stops again. Sometimes these are the signs of the broad Worms. He that is affected with this Worm, is almost alwaies in health, but when he growes weak, he can hardly endure it, or be recovered. For this broad Worm takes some part of those things that go down into the stomach, and if care be taken it may be cured, but if not, the Worm will not come forth it self, nor doth it kill a man, but growes old with him, &c. *Ascarides* are alwaies about the bottome of the belly as we said, and there they cause a great itching almost continually, as *Paulus* and *Aetius* have written; and sometimes, as it is reported, they will make one faint. For that is shewed by their name. For they moving alwaies do continually exercise a man and tire him out. They that are troubled with these, feel alwaies a heaviness about their *Precordia* and backs. The signs of these are chiefly taken from the filthy smelling of the excrements. They that have Worms their eyes at first shine, their cheeks are wan, in the night they have cold sweats, their mouth is pale, they start in their sleep, in the day they are more feaverish, their tongues and are dry lips, their breath commonly stinks, their face is pale, they nauseate and vomit often, they loath meat, they crash their teeth, especially in the night, they put forth their tongues (and they seem to eat) they are angry with those that awake them, they speak strange words, sometimes they are in a lethargy, and pick straws, and their heads ake, they cry out in their sleep, as the disease increaseth, their hearts beat exceedingly, their voice is interrupted, their arteries beat weakly, sometimes in the height of their pain, they are extended, and their mouth fomes as in the Epilepsie, their belly is swoln like a Tympany; some-

Ascarides.

Sometimes the pains abate, and again there follow torments, and Colique pains, with a henterie flux of the belly, sometimes they are costive, and the excrements are hard. These are the signs of Worms, now follow the Prognosticks. The Prognosticks are very necessary in all diseases to know *Prognosticks.* what will be the event, and to know the condition of the patient serves much for the cure, as *Hippocrates*, especially in his Prognosticks, hath abundantly shewed; who in the beginning of his book *de prudent. Medico*, hath delivered it: Especially foretelling here before the patient, things present, past, and to come, and what the sick have neglected, he is thought to understand the condition of the patient; and hence it is that men will better dare to trust the Physitian. But because it is difficult to foresee all this, unlesse we use some artificial conjecture (I call that an artificial conjecture, that comes very neer the truth) and who can easily attain this, unlesse he have learned the things that belong to the art, and remember them, and hath with all diligence exercised himself in the practice of it? The things will be thus known. If a man suppose that there is any vital vertue, he must know the disposition of the patient in strength and weaknesse; and when he is perfect in these, he must study further to know all differences of diseases in the greatnesse and manner of them, and then to learn the foreknowledge of the future state. And when he hath learned all these, then he must exercise himself both in comprehending the magnitude of the disease by exact conjecture, and the force of the patient, and how long they may last. Now practise will help him much in this; and before he hath diligently learned all these, it will no whit profit him to see sick people: wherefore they that professe physick, proceeding in this method, shal never undergo any disgrace, neither in curing, nor foretelling of future events, which they report some famous Physitians have fallen into. Hence it may be collected why some Physitians are more fortunate then others, and what a fraud that is, to call a Physitian more fortunate then another; how absurd that is, *Galen* and *Erasistratus* have shewed; saying, that a Physitian must be exercised in all these things in his minde, and he must be diligent, and prudent by nature, that comparing all together, he may get a grosse summe of prædictions, that shal be useful for himself and for his patient. For such is the force of prædiction, that alwayes for the most part, what the Physitian foresees wil come to passe, where the Physitian is perfect, and the sick doth not neglect his orders. But because, as it is evident, a Physitian by prædictions may get immortality almost, so chiefly from those things that do belong to this affect, he shal win glory to himself, by telling the sick their condition, who for the most part are children, or ignorant what their disease is. Since therefore Prognosticks are chiefly necessary for this disease, I wil not fail to set down what the Ancients have written of this disease. *Paulus* a great follower of *Galen*, writes of these things to this purpose. Worms bred at the beginning of Feavers, have their subsistence from the corruption in the body, about the state of the disease, from the malignity of the disease, about the declining, they grow better. For *Hippocrates* saith, it is good that round Worms come forth, when the disease comes to a Crisis. But *Aetius* writes thus from the opinion of *Herodotus* a Physician. Worms breed in Feavers, and without, that differ one from the other in multitude, magnitude, colour, and time. For Worms bred at the beginning of a disease, have their being from the corruption that is in the body, about the vigour of it, from the malignity of the disease, about the declination, from the change to better, and they are soon also voided forth, Nature driving them to the outward parts, as she doth the rest of the excrements. But the greater ones are worse then the lesser, many than few, red than white, living than dead. Our new writers adde to these; if round Worms are cast forth alive at the beginning of acute diseases, they shew pestilent diseases, but if dead ones be cast forth when the diseases decline, they are an ill sign also, however they appear both these times, it is bad. It may be because that Feaver that follows Worms is alwayes naught, because it consumes the matter for Worms. It happens also, that the Worms are set on fire and grow hot by reason of a Feaver, and so are wreathed together, and moved, that they so much the more affect and trouble those that have these Worms. They adde further, that it is proved by experience, that Worms are in the belly, if in the morning you sprinkle cold water on the mouth of childrens stomachs, for they will all gather to one place. Worms sprinkled with bloud, so voided is ill, for they shew great hurt of the guts, to cast Worms up by vomit is naught, for it shews the stomach to be stuffed with filthy humours. Frequent cold breathing of children, their bodies yet swelling, is deadly, for it shews they will die the next day. If the eyes of the sick are somewhat held together, and cannot be closed by the fingers of those that stand by, death is at hand. Some there are, it may be following the opinion of *Alfagavus*, that say that those who are troubled with *Ascavides*, are but short-lived. But there is a great question to be resolved, and that being done, I shal put an end to those things that concern the Prognosticks taken from Worms. *Aetius* a little before said, that live Worms were worse than dead ones. But *Rhasis* and *Avicenna* that follows him, think the contrary, absolutely preferring the dead ones before the living. In which question, to passe over other men, I shal say what I think, that the strongest affection is taken from those that are dead, because they must needs be driven forth, and cannot come forth of their own accord; yet I follow *Hippocrates*, who in a certain place useth some words that are difficult, wherein he would have us to consider diligently what symptoms Worms breed, for if they come forth without any symptoms they foreshew a good sign. But he makes it clearer elsewhere thus. It is necessary that round Worms should come forth with the excrements, when the disease comes to the Crisis. So that by this we may understand, that if they be voided any other time, it is done rather symptomatically than by force of nature, and therefore they shew corruption or malignity, as *Paulus* and *Aetius* distinguished.

The cure.

But because we can never rightly undertake the methodical way of curing Worms, unlesse the belly in which they are be well disposed, nor can this be, unlesse the whole body be so, and this is excellent well performed by good diet; wherefore that in the first place must be well ordered, for without that all helps are in vain, for the preserving and repairing our health. For this is to famous, and almost the best part of Physick, that that admirable *Corn, Celsus, Galen, Pliny*, and almost all the old Physicians, could never give it commendations enough. *Asclepias* formerly esteemed it so much, that he almost took away the method of curing by Physick, and wholly turned all curing upon diet. Now this consists not only in the quantity and quality of meats and drinks, but also in all those things that befall us whether we will or no, as in sleeping and waking, motion and rest, as also in the repletion and emptiness of the whole body and of every part, and in the affects of the minde, but chiefly in the Air that is about us, which not only sticks fast to us outwardly, but continually enters into the inmost parts of our body by the drawing in of our breath. As for what concerns those things that we take, because they are such things that every man knows, I shall say nothing of them. For there is no man ignorant, that divers meats, and of ill and naughty juice, and disorderly taken, will breed crudities, and that gluttony and drunkenness do our bodies great hurt, yet many kinde of meats, that are hurtfull in other diseases, are profitable in these. Wherefore we shall as it were besides our purpose, and by the way touch upon these, first adding what *Paulus* writes. Let the meats of those that have Worms be of good juice, that may easily be dispersed, and passe to the parts, and neither foster the cause, nor weaken our forces.

Wherefore we grant them wine mingled with water, and let them eat often both for their need, and that the Worms may not gnaw them. If there be a scowring of the belly, it is a sign that many are bred, the meat being not dispersed; and in that case Pears or Quinces must be mingled with our broths; Wheaten bread is a wonderfull help, having Anniseed mingled with it, or Fennel or Salt; or bread that is between Bran and Wheat, called *συνκρίσις*, because there are joynd together in it the Bran, the Hulls, and the Flour. Men call also this bread *ἀντιπνεύον*, because all the Wheat, without taking anything from it, is made into bread. Also the wheat it self that the meal is taken from must be the best, for some of these have much Bran, which is the courser wheat, but the finer wheat is the best. But wine that is mingled with water, because it gently bindes, is held to be very convenient. Mountain birds are fit for their meat, and young wood Pigeons, green Groundsel, and Goats-beard, the broth of black Chiches, and Coleworts, and Capers, and pickled Olives eaten; and if there be no Feaver, let them eat their other meats with Mustard, also sower and oyle things are commended. Also Panick (which *Diocles* called the honey of Corn) is most durable, if so be it may be reckoned amongst Corn. Also Spelt in the decoction of Myxie, and a Ptisane with a great quantity of Oyl of unripe Olives, besides these, Lupines, Cresses, Betes, Mints, Smallage Radish, and sawce eaten are good. Give children before all meat, a decoction of Sebestens with Mints. Milk is very hurtful, as also Fish, and Pulse, and whatsoever is of a cold grosse substance, and hard to be digested. Bread unleavened breeds Worms, for it is good for no man, and so are all moyst meats, that easily turn to corruption within.

For all kinde of Worms it is most convenient to use abstinence from such things as breed them: And when they are bred, it is good to eat often, a little at a time; and that is best, when they leave off gnawing. But those that have *Ascarides* must eat meats of good juice, and of easie digestion, that the force of them may not reach so farre as the right gur. For the matter fit to breed them is so consumed. Thus far for meats and drinks to be taken. But the other five kinds that are not so manifest, shall be handled by us also with all brevity. And we shall begin from sleep. It must not be too little nor too much, and in the night rather than in the day, at least two hours after meat. Moreover, to be long idle is naught, let exercise precede meats, and rest after meats. Nor is every motion to be taken for exercise, but that which makes us breath more; unlesse it be when we have taken Physick against Worms; for then we must ride or run, to shake our bodies; for they are more easily cast forth by hard exercise or labour: but children will hardly observe these rules. Care also must be had, that the belly may twice be unburdened, and if that will not do of it self, we must use a Suppository or Clyster to provoke it, made of such ingredients that are fit for this purpose. All affects of the minde whatever they be, must be set aside, as quarrelling, anger, sorrow, great cares, and thoughts, sadness, fears, envy, and all such kinde of perturbations, and chiefly after meat. For these change and turn the body from its natural state. Let men beware of cold North windes, and let them not go barefoot. The air because it always is about us, cannot be chosen at our pleasure: for it is sometimes a defence for us, and sometimes the cause that makes Worms, or fosters them: It wil be a defence if it be very hot, and dry, pure, clear, and calm; and it wil chiefly foster the disease, when it is very cold, or moyst, or moved by the North or South winde, or by too great heat, dissolves our forces, and then by art it must be thus prepared: To burn in our Chambers wood of Juniper tree or of Citrons, or Peach-trees, and such wood as is against Worms. Also to perfume the place with tops of Worm-wood, Peach-tree leaves, Citron pills, roots of Pomegranate-trees, also with Fern, and Ivy. But that is the best that is made with Myrrhe, and Aloes. Another remedy that succours the fainting spirits, by reason of Worms. Amber greece two penny-weight, Musk one penny weight, Gum Arabick, four penny-weight, Roses, Sanders, Cloves, Privet, Frankincense, of each one penny-weight, *Gallia Molchata* so called, six penny-weight, Lignum Aloes burnt to a cole twenty penny-weight, the quenched coles of Vine-branches, what is sufficient, make them up with Rose Vinegar.

Worms

Worms are oft-times exasperated with vehement remedies, that they bring children to Convulsions, swoonings, and death; wherefore they are not rashly to be given, and at all adventures. But because that remedies by reason of their different qualities are thought to be good to kill and bring forth Worms, therefore in general, such remedies as heat, drie, cut, and are sharp, bitter, salt, or sower, and attenuating, are to be used. For either they kill the Worms by their sharpnesse, or bring them forth by their bitternesse, or they allure them to come forth, or else they are known to be good to bring them forth by the loosenesse that followes. They are brought forth 'tis likely at once, by such supping means as make the passages slippery, or by some effectual quality, that is namelesse. There are some cool remedies that effectually drive forth Worms, and some by a hidden quality, as shavings of Harts-horn. But those things are best that kill the Worms, for so long as they are alive they are an occasion of mischief. And they are hardly driven forth when they are killed, wherefore they must be drawn forth by Clysters; otherwise they send a filthy virulent vapour to the brain, and likewise inflame the body, and hurt the appetite and concoction. But because Worms happen most to children, who are hard to be dealt withall, I thought it not fit to conceal that wonderful way that *Paulus* mentions, whereby Aloes, and certain broths are given to them by way of supping. A certain Cooks Instrument or spoon that is called *Σαλπιστος*, is put into their mouths as they lie upon their backs, and by a little Clyster with a strong Pipe, Aloes is forced down their throats, holding their mouths wide open as far as it is possible. *Polux* makes mention of this, but doth not tell us what it is. But whatsoever *Zomerysis* is, we understand two things by it, that it is made descending, that thereby the bitternesse of the Aloes is not tasted. But by that other Instrument that *Paulus* calls *Clysteridion*, it is forced in by violence. But force and nature concurring, the motion is most swift, the heavy matter running downwards, and is violently driven in by it. *Paulus* also describes another Instrument, whereby moist things are injected into the fundament, it hath many holes quite through it, and these from the matrix are called *Metrenchite*: But *Aetius* speaks clearer thus. To which purpose you must provide a horn Pipe that is full of holes through it, large at the bottome, and convenient for the largenesse of the place, which being thrust in beyond the Sphincter of the Anus, we fill with juice of Cedar, so that the liquor may flie forth every way. But forasmuch as these Instruments are unknown to us, when remedies are given either to kill or drive forth Worms, stop the childes nostrils, and then wash its mouth with some sweet or sharp thing, and when he hath drank down the medicament to kill the Worms, his stomach must be fomented with Acacia or Hypocistis with wine. Those things that kill Worms are best given in sweet milk or honey or Ozymel, or syrup called *Acetosus*. Some first satisfie the children first with three dayes drinking of them, and then they give the physick afterwards. Also they give Clysters of the same sweet things, that they may entice those Creatures to the lower parts. If the belly scowre, it is of necessity that the Worms must be killed at last, for the motion of the belly will cast them forth. But when the appetite is hurt, and the belly loose, the Worms must be killed with bitter things only, that are somewhat astringent, as with Wormwood amongst hot things, or Southernwood and Worm-seed: Or amongst cold things, with Pomegranate pills, Acacia, juice of Plantain, Purslane and such like.

Of hot things the seed of Cresses drives forth all belly-worms, bruised and drank in wine or Vinegar, yet more effectually if wilde Mints be added, yet it troubles the belly. The meal of Lupins licked with honey or drank in Posca, and outwardly applied to the navel with Bulls gall, drives them forth. The same also being infused and eaten with their bitternesse, wil do the like. Also their decoction can do as much, being drank with Rue and Pepper. Sea Worm-wood boyled by it self, or with Rice, adding Honey to it, kills Worms in the guts, and it wil do it better with Worm-wood. Southernwood doth the same by its bitternesse; Cardamomum kills them. Also the decoction of Hyssop drank, or the herb it self licked up with Honey. So Calaminth kills Ascarides, and other VVorms, if it be drank with salt and honey, or if it be eaten raw or boyled, or the juice of it given in a Clyster, or drank. Also the decoction of Thyme, or Rue boyled and drank with Oyl forceth them out. Also wine of Cedar, and the liquor of Cedar it self. Unripe oyl of Olives, if it be drank plentifully, for it is pressed out unripe for children. Juice of Oenanthe hath the same operation, as oyl of unripe Olives. But the best thing against VVorms are sweet Apples called *St. Johns Apples*, for they loosen the belly, and drive out the VVorms; which by what faculty they can do it, (being they are sweet, and of a honey taste, from whence they borrow their name, and since so they should rather feed VVorms) is perhaps, because by this meat the belly is made loose, and the VVorms follow; and the VVorms that otherwise would stay within, by the force of the excrements, as Fishes in a torrent are carried away, when in Summer great rains fall, and so are they carried downward. For *Dioscorides lib. 1. cap. de Melimela*, saith that those Apples make the belly soluble: Also the seed of Coleworts, especially that which growes in Egypt, drank, drives forth VVorms, namely, because the temper of it is drier, and more wilde. The same is done by Oyl of *Palma Christi* drank. Myrrhe also by its bitternesse both kills and drives them forth. The decoction of Elecampane, Squills taken with Vinegar and Honey, but the Squills must be first roasted, or otherwise it is held to be most pernicious to the entrails. Also they use to give against all VVorms the decoction of the root of Capers in honey and vinegar. And *Dioscorides lib. 4. cap. 1. writes*, that the herb called small Turn-soil, drank with the seed, adding thereto Nitre, Hyssop, Cresses, and water, wil force out all sorts of VVorms, long and flat. But *Paulus*, unless there be an error in the Press, reckons Cardamomum for Cresses, *lib. 7. c. 1. Rocket-seed* in wine, wil drive out all living Creatures.

A general cure
of Worms.

Simple hot
medicaments
against Worms
out of *Diosco-
rides, Celsus,
Pliny, Scribo-
nias, Largus,
Galen, Oribasi-
us, Paulus,
Aetius.*

tures bred in the body. Also seven or five Earth-worms drank with sweet wine, wil drive out all kinde of VVorms: Bitter Almonds and the Oyl is good. Agarick with Honey, but it purgeth with trouble; for it is hurtful to the stomach, by making it slippery and loose. Storax swallowed with Rosin of Turpentine: Aloes drank in cold water or milk, the same drank in a decoction mingled with Honey, brings them forth without trouble. The seed of Tithymal or the juice of it about five drops mingled with Figs or Dates. The leaves of Agnus Castus, Polypode, Chamepythe, Centaury the lesse, bruised and drank with Vinegar. Also one peny weight of the root of the same drank in three Cyathi of wine, doth help. Horehound with Wormwood and Lupins, boyled in water and Honey, of each alike, and with wine applyed twice or thrice, kills all Worms in the belly: Costus by its bitternesse, with water kills all Worms. But *Dioscorides lib. 1.* writes that it drives out only broad VVorms, with water and honey; which place *Marcellus* interpreting, blots out that word [and honey] as put in amisse, for this reason, because it is contrary, and seems not to agree with the cure for VVorms. For saith he, they are raised and nourished by sweet things, and belly VVorms are not driven forth by them, unlesse perhaps Honey must be therefore added, that they being deceived by the sweetnesse of it, they may take in the bitter Costus in greater quantity, as we use to do in curing children, when we give them bitter or strong potions, we cover them with some sweet savour, or pleasant smell. In which businesse he seems to seek a knot in a Bull-rush (as we read in the Comedy) and yet he confesseth it to be otherwise. For whether the word Honey be read in *Dioscorides* or not (for I am not yet certain of it, nor hath *Ruellius* set it down) it is sufficient that bitter Medicaments, (such as Costus are, and such like) were given alwayes almost by *Dioscorides*, *Pliny*, *Galen*, and others, for to cure Worms, with sweet things, and chiefly with Honey, or Mede, or Oxymel, for the same reason that *Marcellus* mentioneth, *lib. 4. cap. 57.* which *Paulus* added in these words. Because some men oft times refuse bitter potions, as having an ill taste, of these thing herein comprehended, they shal not give any that are manifestly bitter, but mingled with some sweet thing, as he said a little before, that all these medicaments must be mingled with Honey or Oxymel, and so given to drink: Or as *Lucretius* saith, that the improvident Age of young people may be deceived, or else may be able to take it, being enticed by such a taste. For children most commonly are subject to Worms. Therefore nothing hinders but that the word Honey should be added, as *Marcellus* himself testifies, if we read him in some old Copies. Likewise a Cantharis bruised, and drank with a Briony root, drives forth Worms, as *Galen* writes, *lib. de compos. Theriaces.* Of cold things, the juice of Mouse-ear, with Ale, of each one Cyathus. Groundsel eaten, the juice of Plantain, especially when the belly is loose, given one spoonful or a small measure to drink, and the herb it self bruised, laid to the navel. Coriander seeds with the juice of Pomegranates and Oyl destroy the Worms in the guts, or drank with sweet wine. Hot things, as boyled Beets, taken with raw Garlick, by the Nitrous quality it hath, brings them forth, but the juice is hurtfull. A Pomegranate bruised, and boyled in three Heminae of wine to one Hemina, drives forth Worms, takes away the pain, and the juice of the root one dram and half weight, will kill them. Sumach of Syria will do the same, and the seed of Orache. Our new writers adde, that it is manifest by experience, that the sharpest Vinegar drank when we go to bed will drive out the Worms. But amongst those things that prevail much is *Corallina*, so called, which being powred or mingled with Honey or Oxymel, or drank with Honey-wine, doth wonderfully kill Worms, or drive them out half dead. This took its name from the likenesse of Corall, since both of them grow in the water, and for sixty years almost it hath been used to good purpose to drive forth Worms; if I be not mistaken, this is that which *Dioscorides lib. 4.* and *Galen* call *βρύον θαλάσσιον*, that is, Sea-mosse, and if that they did not attribute to it the same force we do to drive forth Worms, as we see in *Corallina*, as they call it, I shal not therefore think that it is any thing else, besides *Dioscorides* and *Galen* *βρύον*: For the Antients did not know the vertues of all Simples, for the true nature of each cannot be found out by any other way than by its effects in physick. A mighty work and secret from God, than which there can be no greater found out. Also many things are found now adayes that were not found out in our forefathers dayes; and no wonder, since these experiments are made by Countrey-men, and such as are ignorant of learning, who commonly live only where they grow, besides the negligence of seeking, when there are so many Physicians at hand every where. Also many things are found out that want names: To this we may adde the uncertain way of finding out; for in things that are found, some were found by chance, saith *Pliny, lib. 25. cap. 2.* others were revealed by God. But the foulest cause of this rarity is, that they who know things will not discover them, as if they should quite lose what they acquaint others with. They are as envious indeed as those are who either suppress the monuments of Antiquity, or else utterly demolish them; which they for that end, that what is written by the Ancients may be attributed to themselves, or if they have delivered any famous matter, they that write other mens opinions will let that be lost. But if there be any that will contend, and say it cannot be that they should be ignorant that Sea-mosse was good to drive forth Worms, to those I answer, that the Ancients did not commit to writing all the natures of Simples that they knew. For we know many of the precepts of *Pythagoras* and *Socrates*; which yet cannot be known out of their Books, because they wrote none. And *Plato* though he left so many Books in writing, yet besides those he wrote, his followers take many things for his that he never put in writing. Nor hath that *βρύον* growing in every place, as they report, the same faculty, but the Apothecaries in some certain places of Italy fish for it, and they sell it under the name of *Corallina*. But let this suffice.

This

Cold Simples
against
Worms.

This is rather to be enquired into, why, being that Corallina tastes salt, *Dioscorides*, *Pliny*, *Galen*, and others report it to have a cooling faculty, when as it is known that all salt things are hot, and earthly, not unlike to bitter things that are hot? Whether it be, because the sea-water is salt, yet hath in it a great deal of potable water (as *Aristotle* hath sufficiently demonstrated it) and therefore by that it is the less hot? Or else because it contains in it much earth, and so it is drier and thicker? But such things as grow in the sea, must needs be of the same faculty with it. Because therefore that Sea-mosse growes in the sea, *Dioscorides* and others attribute to it a thickning quality, but as it contains in it much water fit to drink; and as it is of an earthly quality, by that it cools. Lastly all that are troubled with Worms, are helped with the smell of the hair of Ichneumon (they call it an Indian rat) as *Paulus* writes.

The juyce of Houfleeke drank in Wine, will drive out of the belly round Worms: Worm-wood Wine drank doth the same. The herb of great Turnfoil drank with its seed, adding there-
unto Nitre, Hysop, Cresses, and water, will cast them forth. The root of female Fern, Simples severally that bring forth Worms round, and Ascarides, and broad Worms.
3 drams drank in Wine, will force out the round and broad Worms of the belly, as *Ruellius* and *Marcellus*, who interpreted *Dioscorides*, do both assert. But *Galen* saith that it kills not round Worms, but Ascarides and broad Worms, for so he writes, *lib. Therapeut. method. cap. 14.* But Wormwood can destroy round Worms, broad Worms require more strong helps, as Fern is, and so doth that Worm the Greeks call *ACCEIS*. *Theophrastus* was of this opinion, who writes that female Fern mingled with Honey is good against broad Worms of the belly, if it be mingled with Honey; and for Ascarides, in sweet Wine. For so he sets it down: *Female Fern is good against broad Worms and small ones*: against broad ones mingled with Honey, but against small ones in sweet Wine. It is certain that Ascarides both are, and are called small Worms. Moreover, *Galen lib. de simpl. Medic. facult. 8.* ascribes the same vertue to the female Fern, that the male hath. Now *Pliny* writes that the female will kill only broad Worms and not round. *Plin. lib. hist. 27. c. 9.* And again, that both, (that is, both male and female) will drive forth Worms of the belly, broad Worms with Honey, the rest with sweet Wine drank for three daies, and he excludes neither round Worms nor Ascarides. But *Galen* in one place excludes both round Worms and Ascarides; and in another place he writes that it will destroy Ascarides with broad Worms. What now shall we say, where Authors are of so many different opinions? shall we say that female Fern will kill all Worms in the belly? For *Galen* ascribes the same vertue to it he doth to the male, but that especially it kills broad Worms, and in the next place Ascarides, which being at the bottome of the belly, require a stronger remedy, as Fern is, that the force of it may come so far. But since it can drive forth broad Worms and Ascarides, that are more seldome, and the one is in the guts, the other farthest from the stomach, it will far sooner destroy round Worms that lie in the upper guts. *Galen* therefore will not fight with himself in this, for it sufficeth if it will kill broad VVorms, and if it can destroy them, it can more easily destroy Ascarides, and easiest of all round VVorms. But *Pliny*, as who best of all knew that, saith it will drive out the rest also, (that is, both round VVorms and Ascarides). But that he saith so is manifest out of *Paulus*, *lib. c. 58.* who in his method of curing round and broad VVorms, mentions Fern: which yet all men agree is most properly used to drive forth broad VVorms. *Avicenn. 16. Tertii tract. 5. c. 4.* shewes this most clearly in these words: *The medicins that kill Ascarides are stronger than those that kill long Worms; and those things that kill long Worms and Ascarides will also kill broad Worms.* Gith or Nigella not only eaten but laid in a plaister to the belly, or anointed on the navil with water, brings them forth. In which place we must note *Marcellus*, who saith it will drive forth broad VVorms and not round: but *Ruellius* interprets this by the contrary. If *Marcellus* have done right, I leave other men to judge, this is certain that *Galen* is of *Ruellius* minde, who hath written only that it will kill VVorms; and as I said before, it is taken generally for round VVorms. *Paulus* and *Aetius*, agree with *Ruellius*, who in their curative method for round VVorms, often speak of Gith, but never for broad VVorms. Wormwood called Santonicum, of it self or boyled with Rice, adding Honey to it, will kill Worms. The seeds of Nettles bruised, or of Coleworts or Cummin, with water, or Mints with it, or Hysop with Honey and water or Cresses-seed bruised with Vinegar, kills them. *Celsus l. 4. c. 17.* *Oribasius lib. ad Ennapium filium*, hath written that Calamint, Cardamom, Lupins, and the powder of them in drink, or with Honey by way of Elixuary, or given in Posca to drink, are sufficient to kill round Worms. Also the leaves and buds of the Peach-tree bruised, and laid upon the belly can do as much; also Mints in drink and Sorrel. Purslain boyl'd, the juyce of Succory, or the decoction of Sebestens, or the Sebestens themselves boyl'd and eaten are very good. Also the ashes of burnt Harts-horn is thought very effectual for this use, especially of that which growes on the right side of the Stags head. It is burnt thus: Break the Harts-horn, and put it into a new earthen Crucible, and lute it well, put it into the furnace and let it burn till it be white. *Scribonius Largus, c. 141.* gives it thus: Harts-horn, saith he, raspt with a workmans rasp, with water of Sebestens boyled, give 4 or 5 spoonfuls of it, which were soaked the day before in 3 cyathi, then bruise and give it, adding the water to it. An Oxe shank burnt, and drank with Milk, drives out round Worms, saith *Galen*. *Costus* with water drives forth broad Worms of the belly. *Galen de com. Ther. ad Pis.* Cardamom, Garlick eaten. The leaves of female Fern taken with Honey in a Lohock. But the root of the male 3 drams with Honey-water drank, will drive them
Cccccc

them forth, but better, if it be given with so many oboli of Scammony, or black Hellebore. Also the root of white Chamæleon, drank a sawcer full, for which use it is drank with sharp Wine and the decoction of Origanum. Walnuts eaten largely, the pill of the Mulberry-root boyled in water and drank; besides that it loosneth the belly, it will force out broad Worms; also the decoction of Pomgranate roots drives them out and kils them. The decoction of Pomgranate pills can do as much. The root of wilde Bugloss a sawcer full, with Hyfop and Cardamom drank, doth the like. *Ruellius* the Interpreter of *Dioscorides*, seemsto have followed *Paulus*, who say that with Hyfop and Cardamom: but *Marcellus* saith, with Hyfop and Cresses drank, it will drive forth broad Worms, what was said before of Turnsoil. *Marcellus* seems here to follow *Galen lib. 6. de simp. fac.* who writes that a sawcer full of it is good drank with Hyfop and Cresses. But the juyce of Cedar kils Ascarides, and so doth Calamint, the juyce of it being drank or given in a Clyster. The decoction of Wormwood, mingled with oyl and given Clyster-wise, and the decoction of the lesser Centory given with Salt-peter and Honey, hath the same force, or the decoction of the wilde Gourd, of wilde Saffron, if the right intestine were first emptied with sharp pickle. The root of female Fern drank for three daies in 3 drams of Wine, drives forth Ascarides. Also old Hogs-grease put into the Anus, is excellent good.

The methodi-
cal Cure of
round Worms,
chiefly out of
Paulus and
Aetius.

Both *Paulus* and *Aetius* testifie that Feavers commonly accompany round Worms, and we found it true by daily experience. When therefore there is a Feaver, sometimes we must take care to cure the Feaver and the Worms, and sometimes taking little care for the Feaver, we must strive to drive the Worms out of the belly. For many that have neglected them have died torn and eaten up by them, and some say they have seen them come forth at the groins. But we must first kill them all, and then drive them forth; they are killed chiefly with bitter things. When therefore the cure is common both to the Feaver and the Worms, the more simple remedies are convenient, and where the disease is uncertain we must use things that are more milde. For the Feaver is exasperated with strong remedies if we should be mistaken; but when we are certain how the matter is, we must wait for the times of the disease. For about the first daies, and the rather if they should appear then, we must use stronger remedies. But those that appear when the disease declines, are more easily cured, and the better if there be no inflammations or tensions of the bowels. As *Hippocrates* saith well, *lib. Aph. 1. cap. 24.* In acute disease but seldome, and that at the beginning we must use purging Medicaments; and this must be done with premeditation, for these swell most, and are agitated as 'tis often seen, and therefore about the beginning of those diseases, we may use sharper means with profit, but there must be much caution, and premeditation used therein. First examining whether the patient can endure such remedies, and be prepared rightly for them, and whether we may expect a right Crisis by giving them. For there is no small danger in an acute disease, as the sickness of Worms is, to use sharp remedies, because all such means are potentially hot. Therefore they that suffer inflammations and extensions, must have Cataplasms of Linseed, with the like quantity of meal of Lupins mingled, or else moist fomentations of oyl of Camomil, Wine, tops of Wormwood, and Aloes laid to their Præcordia; but where moderate Feavers molest, give children before all meats, the decoction of Myxato-drink, or give them the Sebestens themselves to eat with Mints. For these things wonderfully help those are troubled with Worms, either because, saith *Serapion*, they stick by reason of their sweetness to them, or else these are so glutinous, that they cannot be parted from them, and so must come forth with them. For Myxa are very clammy, that in *Syria* the best birdlime is made of them called Damask-birdlime: wherefore because by their clamminess they bring forth Worms, if they trouble the stomach, they must be given by the mouth; but if they be in the belly and guts, by clyster: but to such as are come to ripe years, stronger remedies may be given, as the decoction of Wormwood or Southernwood, or the force of the root of the sower Pomgranat boyled to thirds, also three scruples of washt Aloes is given, which is the most commendable remedy for those that are strong: also we use unwasht Aloes, and both, if they be feaverish, and but three moneths old. Earth-worms with boyled sweet Wine may be given confidently; but if they will not drink sweet wine, give them with water and honey, or as you think fit, fearing nothing, not despising the meanness of it, give 5 or 7. But if it be not a naked suspicion, but a certain knowledge that there be Worms, and that a proper cure belongs to them, then you must lay on Cataplasms with Lupins meal boyled in sweet Wine, to which also sometime a root of Briony must be added. In the mean time anoint the navil well with Buls gall, or Gith bruised with womans Milk, or with Wormwood, or Southernwood, or Briony mixed with fat old Figs: anoint all the *Spina dorsi* with Deer-suet, and cover the upper belly with a Cerate made of Wormwood and Cypress oyl. Moreover a Suppositor must be put up where the belly is bound, especially for children, and if it profit not, then give a Clyster, the vigour of the disease abating, made of the decoction of Wormwood, or Southernwood, or Centaury, with Honey and Nitre. And we shall endeavour to draw them out by supplings, that make the passages slippery, such are oyl of unripe Olives, supping up by little and little two spoonfuls of it, for as it is bitter it kils Worms, and as it is glib it drawes them forth with the dung. But we must alwaies increase the potions of oyl for they are very commodious. The Worms come forth, some yet alive, but they are giddy, and as we may say half killed, and many come out dead with the excrements. Moreover Worms will breed when there is a scowring of the belly, we must cure

cure them by stopping the flux, and by bettering the concoction with meats and Cataplasms. For the more the flux growes, the more the Worms breed; and when the flux ceaseth, the Worms do the like: wherefore we must diligently endeavour that the belly may be stopt and strengthened; we must therefore add to such Cataplasms as serve to stop other fluxes, such things as we said to be good against Worms, and that cause no fluxes, such as are Wormwood, Southernwood, Santonicum; also Pomgranate pils, Acacia, Hypocistis, Balauftia, and the like, with raw Barley-meal. Also Cerats laid on must be made of these. Also suppings must be used amongst all which the juyce of Plantain is best; and the dry Plantain, for it is good both against the flux and the Worms. Farthermore the VVine of the Pomgranate pressed forth with shell and all helps exceedingly. But for nauseating that ariseth from VVorms, and gnawing of the stomach, a grain of Salt held in the mouth, and melted and swallowed down, profits wonderfully, for it should seem the tartness of it, makes them presently fall down. But if a hickop arise from the same causes, pils are good, that have the juice of Ridder-spin, Wormwood, Santonicum, Water-mints, Scordium, of each four penny weight, boyl them to the thickness of Honey, then add fifty penny weight of powdered Aloes, and make pils of all, and swallow a penny weight, for this will take away the hickop, and kill the Worms. But if from the Feaver or filthy vapours arising from Worms, or the fumes of Medicaments (as most of those are that are given against Worms) rise to the head, so that there be great pain thereof, then anoint the forehead of the head, the forehead and temples with oyl of Roses, or the juice of Acacia, or of Hypocistis mingled with it, for it is most effectual. Others lay on leaven with a little Saffron and Vinegar, on these parts being anointed: for this cures all intemperate sleep, and other perverse affects. But amongst those men call Syrups, syrup of Wormwood, Calamint or Horehound are commended: or make one thus: Take juyce of Mints, Elecampane root, Wormwood, Rue, purified, for it is taken the sediment being cast away, of each of them half a hemina in weight; of the juyce of Succory and Grasse, of each of them seven cyathi in weight, infuse in these torrefied Harts-horn, Sumach, Purslain seed, and flowers of wilde Pomgranates, strain the decoction and make up all with Sugar, or the purest Honey of Athens. Another: Take Southernwood, Calamint eight penny weight, Horse mints, Elecampane-root fresh, six penny weight, boyl them in water to a third part: this decoction is given with syrup of Wormwood, or Oxymel of Squils. Also Wormwood-wine is much commended for these uses, but it is made divers waies, for some let down Celtick nard 40 drams bound in a linnen clout, into a measure of new Wine, and after 40 daies they strain it. Others cast a pound of Wormwood into 20 sextarii of sweet Wine, and a sixth part of Pitch, Rosin, and after ten daies they strain it, and lay it up for use. A syrup against Worms, with a Feaver and the symptoms: Take sixteen penny weight of Grasse-roots, Purslain-seed, fowr Dock, of each eight penny weight, ten sebestens, boyl all to thirds, to these add the juyce of Pomgranates, and Oranges, or fowr Wine, of each one and half cyathus in weight, as much of juyce of garden Succory, the best Sugar what may suffice, boyl them to a syrup: you may give Infants half an ounce, and young children one ounce without danger. A Julep that shall help those are affected with Worms: Take Dittany of Crete, Gentian Zedoary, Arabian Costus, one penny weight, seeds of Coleworts, Dill, Wormwood, Purslain, of each alike as much; water of Mints, Wormwood, Grasse, of each half a hemina weight, boyl them to thirds and strain them, to these add of the best Sugar twenty penny weight. But in a Feaver you may give the decoction in water, or Grasse-roots, Wheat, Barley, of each fifteen penny weight, to a large quantity to drink. Another most effectual and very sweet: Distilled water of Sorrel, Roses, Grasse, garden Endive, Bugloss, juyce of Pomgranates, of each one hemina weight, seeds of Purslain, Orach, Sumach, Citrons, of each three penny weight; Coriander-seed, Myrtle-berries, wilde Smallage, of each two penny weight, seeds of fowr Dock, Coleworts, Cummin, of each the same weight; red Roses, Tormentil, Barberies, of each two penny weight, so much weight of Balauftia, five penny weight of the ashes of burnt Harts-horn, white Dittany of Crete eight penny weight; the shels of Mulberry-roots barked, Fern-roots, of each two penny weight, ten Sebestens, one penny weight of red Coral, white Sugar what may suffice, make a Julep. But the most present remedy of all is that the Apothecaries call commonly *Diaturpethum*, but chiefly with Rhubarb, three drams of it being swallowed down; which being it is proved by long experience, so it hath also great reason for it, that it should be preferred before all other remedies. For children enticed by the sweetness of the Antidote, will take it down willingly, and the Rhubarb kills the Worms, and the parts are strengthened by it. The Turpeth drives them from their nests, and the rest of the ingredients do not only make it pleasant but harmless, so that it is most sweet, harmless and strong all at once: it is made thus: Take white Sanders and red, Violets, Ginger, of each two penny weight; Anniseed, Cinnamon, Saffron, Mallick of Chius, each one penny weight; Myrthita, which the Apothecaries call Turpeth, eight penny weight; Rhubarb, ten penny weight, Scammony as it is usually prepared, four penny weight, the purest Sugar 190 penny weight, make up all with that and make Troches (as the Greeks call them from the form) each three drams weight, where you have need of them, give one for this disease. Another Antidote: Take Rhubarb, Saffron, Scammony, Wormseed, Dittany of Crete, each two penny weight, the best Sugar eighty penny weight, make them up with Grasse-water, and make Troches; one penny weight of this is given to Infants without danger, being dissolved in Grasse-water. The powder I use is good, and a powder thus prepared: Take Rhubarb, Agarick, Germaner,

Compound in-
ternal Remedy
dies to kill
and force out
Worms.

Compound external Medicaments against Worms.

of each two penny weight, Sea-moss four penny weight, Wormseed and Purslain-seed of each two penny weight, unwashed Aloes six penny weight, give a scruple of this or two oboli in Wine to children safely. Sometimes all these are bruised and sifted and made into pills with the juyce of Wormwood or Mints, and three of them are swallowed down. *Another for the same by another Author:* Take Harts-horn burnt, the less Centory, Mints, Penniroyal, Water-mints, Wormwood, Santonicum, Germander, Lupins, of each four penny weight, bring all to very fine powder and give it with Milk, Vinegar, or Oxymel, or any way. *Another of the new Writers that is approved:* Take Rhubarb, Coriander-seed, Basil-seed, Plantain, Pomgranate pills, Carway-seeds, Sumach, of each two penny weight, Carduus Benedictus seed, shavings of Harts-horn, and of Ivory, of each eight penny weight, the bark of the roots of Mulberries pill'd, Colewort-seeds, Citron Apple-seeds, bark of Willows, of each six penny weight, Purslain-seed, Dittany of Crete, four penny weight of each, Pearls, red Coral, of each two penny weight, dry them and bring them to fine powder: one or two drams of this with Wine in winter, and where there is no Feaver, or with Oxycrate in summer or to those that are in a Feaver is safely given. An Antidote that kills Worms, diminisheth a Feaver, and helps against pains of the heart: Take Wormseed, Sea-moss, seed of wilde Smallage, Harts-horn burnt white, of each alike, infuse them all three daies in Vinegar, wherein let these things first boyl, Purslain-seed, Sorrel-seed, Sumach, Coriander, Colewort-seed, and a little Myrrhe; then dry them, and add to them Orange-seeds two parts, Citron-seeds one part, make them up with Sugar dissolved in the Wine of Pomgranates, and make morsels, to which you may add some little Cinamon and Musk. But because it hath been seen oft-times that Medicaments outwardly applied have done much good against Worms, it is but reasonable that I should set down the manner of them: For by these we not only defend our bodies, but also we kill the Worms and drive them out dead: wherefore this may suffice that hath: Lupin-meal, less Centory, leaves of Peach-tree and Horehound, bruse them with Posca and lay them to the belly. *Another tried by our newer Physitians:* Take the less Centory boyled in the oyl of Peach-kernels, anoint the Navil with this, and it will drive forth the Worms. *Another:* Toft Barly-bread, and infuse it in Vinegar, then press it out, and infuse it again in the juyce of Peach-leaves, lay it on warm to the belly with a linnen clout. Others mingle Lupine meal, Southernwood and Buls gall. *Again:* Take Lupine-meal, Centory the less, of each four penny weight, Aloes, Buls gall, of each 4 oboli, make them up with juice of Wormwood, and laid to children very young. *Another:* Take Wormwood, Gith, ashes of Harts-horn, of each a like quantity, mingle them with Honey and anoint them. *Another good for the stomach, that kills Worms, and is good against the belly flux:* Take Wormwood, Mints, Roses, Santonicum, Lupin-meal, of each eight penny weight, tosted bread, infused in the sharpest vinegar four penny weight, Buls gall sixteen penny weight, Mountain-nard, Water-flag, (Gallia called Moschata) Cloves, sweet Cane, Nutmeg, Galanga, Carway-seed, of each twelve penny weight; Hippocystis, Acacia, Sumach, of each four penny weight, oyl of Myrrhe, juyce of Mints, and Wax what sufficeth, make a plaister. If there be no Feaver, the navil and thighs are to be anointed with Honey, in a hot affect with Milk, and then a little Aloes is strewed on, for it wonderfully kills Worms, also the nostrils are profitably anointed with Theriac and Vinegar. *A Cerate against Worms out of Paulus:* Take Aloes, VVormwood, Lupin-meal, Seriphium, Gith, of each six scruples, VVax an ounce and half, oyl of Camomel what may suffice, make them up being bruised dry with Buls gall. *Another out of Aetius:* Lupin-meal, VVormwood in powder, Barley in fine powder, of each seven penny weight; Buls gall, eight penny weight; rasping of Harts-horn, four penny weight; VVax, twenty six penny weight; weak oyl, twelve penny weight. *Another approved:* Take Aloes half an ounce, Saffron two oboli, juyce of Pomcitrons as many drams, mingle them with sweet white VVine, and apply them to the heart. *Another approved:* Take Buls gall, 30 penny weight, choise Frankincense 128 penny weight, Strong-water 2 hemina, distil all these chymically and in a glass vessel covered with VVax, keep what comes forth, and use it when occasion is. *Another very excellent, that kills and casts forth the Worms:* Take VVormwood, Gentian, Centory the less, bark of the roots of Mulberries, Bay-berries with the kernels taken forth, bark of the roots of the Pomgranate-tree, Ash-root pills, of each 16 penny weight; Marjoram 14 penny weight; Southernwood Aloes, Myrrhe, Agarick, of each 12 penny weight, Dittany of Crete, Germander, Savin, of each 8 penny weight; Poly-mountain, Grass-roots, each 10 penny weight; Stachas, Chamædrys, Chamæpity, Pomcitron-seed, each 6 penny weight; ashes of Harts-horn, Santonicum, 4 penny weight, Coloquintida-seed, 2 penny weight, Buls gall 24 penny weight, the sharpest Vinegar 1 hemina and 3 cyathi, a gallon of bitter oyl of unripe Olives, and 6 hemina; let the dry things be beaten into most fine powder, and mingle them ten daies together, on the eleventh day let them boyl in a double vessel until the Vinegar be consumed; when these are cold, add one hemina of oyl of Bayes, bitter Almonds, and Peach-kernels, of each beaten 24 penny weight; all these, as the former, must be put into a glass vessel, and be distilled. *Another most excellent and sure:* Take Peach-kernels, Garlick, Earth-worms washed in Vinegar, of each 24 penny weight; Gentian, Dittany of Crete, Grass-roots, and Piony, pills of Mulberry roots pill'd, of each 52 penny weight, Saffron, sweet Cane, Cloves, Aloes, Calbanes, Coloquintida, Ginger, Nutmegs, Cassia, long Pepper, Frankincense, fruit of Balsome, red Coral, of each 8 penny weight; the best Theriack 12 penny weight, Mints, Wormwood, Centory the Less, Peach-tree leaves, headed Deeks, Penniroyal, Calamints, Plantain, Rue, black Hore-

Horehound, Bay-leaves, Sage, Marjoram, Betony, Scordium, Orange-pils, and bark of Mulberry roots, of each 16 penny weight; seeds of wilde Smallage, Purslain, Radish, Coleworts, Santonickum, Plantain, headed Leeks, sea Moss, garden Smallage, (that is, Parsly) each 12 penny weight; the sharpest Vinegar, juyce of Quinces, of each one hemina; oyl of Mastick, Spike, liquid Bitumen, (they call it *Petroleum*) oyl of Bayes, of each 16 penny weight; the oldest Oyl, or oyl omphacine, 8 hemina; beat the dry things to powder, and mingle them, and in a glased vessel set them under Horse-dung for a moneth, then boyl them in a double vessel to thirds, strain them when they are cold, and straining them out forcibly, keep in a glass, what comes forth for your use. But employ it thus: first anoint the temples, then the nostrils, next that the spondyls of the neck, four of them next the throat, then anoint the pulses of the arms, next to that the stomach, I mean by the stomach the mouth of the ventricle, taking the word stomach improperly, for properly it signifies the throat; wherein I must not passe over the error of our new Physicians, who in affects of the mouth of the stomach, lay their remedies upon the back over against it, which is both contrary to *Galen*, and also to reason, 1. & 10. de morb. cur. libro. yet I believe *Thomas Linæer* did not rightly interpret that place, if I be not mistaken, who was indeed otherwise a very learned man, and most skilful in the interpretation of Authors; but it may be that Greek Book was faulty, or for some other reason. Also it seems agreeing to reason, that for affects of the mouth of the stomach, the remedies should be applied before, immediately under that round gristle, which they call the shield or sword-fashion gristle, for at this place the mouth of the stomach best receives the force of Cataplasms and Cerats, forasmuch as there are no bones to keep it off, but the properly called stomach, that is, the throat is fenced with most strong bones, as under a fence; for it hath the breast bones before, and the back behinde. But this is spoken by the by. Now between the wetting of one place, and of another, we must stay so long as a man might walk about 40 paces; and when these places are wet, we must use more distance of time, when we anoint the reins and the navil. And these three remedies are so certain, that unless a childe be ready to die, he will recover from the point of death only by anointing these parts. That which is called the broad Worm abounds in those that have no Feaver, and breeds in long during diseases. The method to cure these is the same as for round Worms. For bitter and sharp potions are most in use, and to eat Garlick or Calamint, Dittany or Penniroyal; we must eat Garlick largely for three daies, and old soft Cheese. Next let a man eat of *Macedonian* Fern dried and powdred and sifted, 8 penny weight, with as much Honey as he please; after four hours give the patient Aloes, and Scammony, of each one half dram, in Honey-water 4 cyathi, when he begins to rise to stool, set hot water under; Also give water to drink in which Lupins, or the bark of Mulberry-tree is boyled, or to which there is added a sawcer full of Pepper, or bruised Hyssop and a little Scammony: or else after the eating of Garlick we speak of, let him vomit, and the next day let him gather as many Pomgranate roots as he can hold in his hand, and bruise them and boyl them in 3 sextarii of water, to a third part remaining, let him put a little Nitre to this and drink it fasting; three hours then past, let him take two Potions either of water or salt pickle added to it; Then pour forth the hot water into a basin, as I said: also give Earth-worms to drink, for they are exceeding good. But the juyce of mouse-ear is proper for them, drank two cyathi with one cyathus of Ale: for it quickly drives forth the broad Worms. But this remedy following must first be drank; nor is it thought unfit for those that have Worms, especially if they have no Feaver. Out of *Paulus*. It consists of red Nitre, Pepper, Cardamoms, of each equall parts, mingle all these and give of them a spoonfull in Wine or hot Water, for it quickly brings them out.

Another, which is an Electuary of *Paulus*. Take Pepper, Bay-berries cleansed, *Aethiopian* Cumin, Mastick of *Chios*, of each alike, Honey what may serve turn, give one spoonfull in the morning, and let them sleep upon it; but if you would do this more effectually, adde Nitre as much as of each. Another of the same. Take Fern a sawcer-full, Nitre two penny weight, give it with a Spoonfull of water, after evacuation, but it is better to adde a little Scammony to it. Another of the same, and of *Aetius*. Take of the bark of the root of a lowre Pomgranate, scraped from the upper part, Pepper, of each four penny weight, Cardamoms six penny weight, Horehound two penny weight, the best Honey what is sufficient, give one spoonfull of it after eating Garlick or Leeks. But that the disease may be wholly driven away, give some Theriac, for *Galen* highly commends it for this use. Another out of *Oribasius*, that he alwayes used by the experience of his masters, and had a long time proved it for good. It contains Scammony one Scruple, Euforbium as much and half as much, the powder of burnt feathers one scruple, Nitre in weight one Siliqua, give this to drink in honey'd or sweet wine. But it will fall out better if he first eat Garlick or some sharp thing. Also here is a Plaister of another Author, that is good against all Worms, especially broad ones. Take Lupines, Bay-berries cleansed, Bulls gall, lay these on the navel and binde it on with a swatheband for one day and night, or else for two or three daies. Against broad Worms from another Authour. Take Southern-wood, scraped Harts-horn, *Coccus gnidius*, and *Sesamum*, of each one penny weight, Cardamoms three oboli, give this to drink with Oxymel. Another for the same use. Take Gum Arabick, one penny weight, Fern three penny weight, Cardamoms one penny weight, Nitre three penny weight, give it in Hydromel or Ale. Also against the same, is the Antidore called *Diphæreon*. Take Fern eight penny weight, Scammony, Gith, Cardamoms, salt Nitre, of each two penny weight.

The Cure of broad Worms, chiefly out of *Celsus*, *Oribasius*, *Scribonius*, *Paulus*, and *Aetius*.

Victorinus, is a piece of Monney of 3 oboli, or half a dram.

weight, give it in Oxymel or Ale, but adde Polypode four peny weight. It is reported, that Ascarides will trouble children, and such as are come to their full growth. But children are continually provoked to excretion, and after egestion they are the better most commonly, but those that are come to their full growth, observing the trouble of such things that are the cause of them, will thrust their fingers into their fundaments, and pull them forth, and further they will foment and abate these biting pains, with peble-stones that lie in the Sun on the shores, or else with stones put into the fire. But some for fear will admit of none of these helps; yet this disease ought not to be neglected, for Worms will not easily yeeld to remedies, nor are they easily driven forth, but by strong means. Wherefore children must be purged with Suppositars made of Honey and a little salt, or Nitre, or sharp pickle, or with the decoction of Wormwood mingled with Oyl. Also there ought to be a stronger purging, and when they have voided their excrements, the Longanum, which is the place affected, must be anoynted with it. As for Simples, they are Acacia, Hypocistis, the juice of Sumach, with liquid Allome or Nitre, but the Compounds are the Troches of *Andron*, and those that are called *Sphragides polydiae*, and with fat Wooll and such like; for the flesh is made stronger by Astringents, and loseth its readinesse to breed living Creatures, and thrusts forth the Ascarides. *Andron* his Troches are made thus. Take flowers of Garden Pomegranates ten peny weight, Galls eight peny weight, Myrrhe four peny weight, long Birthwort, and as much Vitriol, Saffron, scissil Allum, dregs of the Oyl of Saffron, *Myfi*, Frankincense, of each two peny weight, they are powdered and mingled with astringent wine, or with Vinegar. But *Sphragis polydiae* is thus. Take scissil Allum three peny weight, Frankincense four peny weight, Myrrhe as much, or eight peny weight, Vitriol two peny weight, flowers of tame Pomegranates twelve peny weight, Bulls gall six peny weight, Aloes eight peny weight, make them up with sharp wine: But that which is made with fat Wooll is thus made. Take fat Wooll forty peny weight, lead powder, shales of Bitumen, of each ten peny weight, round scissil Allum, Pomegranate shells, Galls, *Myfi*, Vitriol, Frankincense, of each five peny weight, Myrrhe two peny weight, lees of Oyl eight Heminae. Those that are of riper years must be purged with sharper and hotter remedies, as with Diapicra, and with Oyl mixt with wine, in great quantity, and other things infused, as salt pickle, the decoction of Centaury, with Nitre and Honey, or Coloquintida, Chamæleon, Anchusa, Lupins; then Oyl of Cedar must be given in Clyster, and after that rest; often repeating the same method of cure, also take salt flesh, scraping away the fat, and cut it long and round, and thrust that into the Anus, and binde it in, to hold it there so long as may be, and then lose it, and inject again the foresaid things, and let us often repeat the same remedies.

CHAP. XXXIV.

Of Worms that breed without the Bowels, and chiefly of Maggots.

THE living Worms that are bred in the head, the brain, the liver, milt, bladder, reins, muscles, proceed from the same causes Worms in the guts doe, and are destroyed by the same remedies. But those Worms *Hippocrates* calls *Eulas*, the English call Maggots or Gentils, they are Worms without feet, not unlike to *Ascarides*, but that they are shorter a little, and thicker considering their length: There is no man almost that hath not seen these in Carrion and corrupt flesh, and sometimes in limbs that are dead by the negligence of Chirurgions, when as they apply a remedy that putrefies together with the wound or ulcer. *Hippocrates* calls *Eulas* Worms bred in dead bodies. *Suidas* calls them *ill beasts*, flesh-eaters. *Lucretius* calls them cruel Vermin, and *Plutarch*, Worms from corruption and putrefaction of the excrements boyling forth. *Homer* in his *Iliads*, 19 and 24. saith they are Worms arising from putrid matter, that are far smaller in the ears than in other ulcers: And *Cælius* writes, that they are called *Eula*, which *Latin* writers call improperly Ear-moths, since they agree with them neither in form nor figure nor in any mark whatsoever. Lastly, those small Worms that breed from Flies egges in flesh, in Summer, (the English call them *Flie-blows*, and the Germans *Maden*) as *Camerarius* observed, are reckoned amongst *Eula* or Maggots. But those *Eula* or Maggots that breed in Hogs flesh or Bacon, have a proper name given them by *Festus* and *Perottus*, who call them *Tarni*, Maggots. Have either a tayl, or they are without a tayl: Hens feed on both kindes of them, and so it is likely other Birds doe. To make a woman conceive *Hippocrates* prescribes three or four parts of those that have tayls, bruised with Origanum and Oyl of Roses, to be laid to the mouth of the matrix. In his first *de morb. mulier.* and in another place of the same book, he bids apply with Wooll the heads of these Worms mingled with the Secondine of a woman, and Allum of Egypt, and goose grease.

It is reported that *Democrates* of Athens, when he was a youth, and was sick of the Falling sicknesse, went to *Delphos*, and enquired of *Apollo*, what he would advise him to take against this troublesome disease, and that *Apollo* answered;

Take the greatest Maggot you can finde
In a wilde Goats head, and fast binde
That in a sheep-skin, &c.

Democrates

Democrates having heard the answer of *Apollo*, he repaired to *Theognostus Democratus*, who was then ninety yeers old, and he wondring at the providence of God, expounded this Oracle that was so doubtfull: Saith he, by nature the head of a wilde Goat is full of abundance of Worms, neer to the basis of the brain, and when he neeleth, many Worms fly forth at his nostrils; you must therefore lay a garment under the Goat, that these Worms may not touch the ground, but that you may catch them before, and so taking one or two of them, put it into a black Sheep-skin and binde it to your tender neck, and this saith he, is a natural remedy against this disease. *These things are good against Maggots bred in ulcers and wounds in man or beast.* First cleanse the parts affected, with the gall of Frogs, the juice of Celandine, Sea water, or brackish water, with the decoction of Honey, Worm-wood, Horehound, Peach-leaves, Groundsel, juice of Betes, and Wine; then to kill the Worms, strew on Pepper, Salt Peter, or Allum in powder, Hellebore, Henbane, round Birthwort, Vitriol, or wash the fore-places with the juice of river Calamint, or the decoction of Centaury, or with the juice of Leeks or Horehound. *Johannes Agricola* prescribes Bugloss, but *Pliny* preferres *Aristolochia* with Honey; and *Paracelsus* commends juice of Celandine. *Montanus* commends Nitre before all other things. *Vegetius* bids to wash the sores early in the morning with cold water, and to drench them thoroughly, for he affirms, that the Worms by this means will be so contracted with cold that they will soon fall down. *Aetius* commends Poly, and Worm-wood mingled with Pitch, and he commends the anoynting of the parts with fasting spittle. *Hildegardis* strews on the pith of Smallage, the shell of a Tortoise, Bees that are dead in the Hive, the leaves and the bark of the Plum-tree, powdered and sprinkled on the ulcers. *Bayrus* applies quick lime tempered with the sharpest Vinegar. The places where the Worms are being sprinkled with the juice of *Hippia*, will be presently cured, saith *Tardius*; but what this *Hippia* is, no man hath determined: Some think it is wilde Tansey, some say 'tis *Potentilla*; *Gesnerus* understands it to be Chickweed, which by its sharp and Nitrous faculty (as the Betes have) kills all the Worms.

CHAP. XXXV.

Of Nits.

NIts in the *Greek* are called *Dorcus* and *Cumidas*, the *Italians* call them *Lendine*, the *Spaniards* The Name
Liende, the *Germans* *Niss*, the *English* *Nits*, the *Muscovites* call them *Guida*. These are lit- and Descrip-
tle white living creatures, most like to *Syrones*, if they had but feet, but they are twice almost as tion.
small; and their body is somewhat long, out of which *Aristotle* saith that nothing else can breed.
Crackt between the nails they make a noyse and die, they are not found only in the hair and eye-
browes of men, but they abound also in the hair of Oxen and Cattel that are lean, and wanting
feet, yet they will stick so fast sometimes, that you may as easily pull off the hair by the roots as
pluck them off. *Trotula* not improperly calls them *τρυχόβρωτος*, hair-eaters, for as Snails live on
the juice of herbs, so these live on the moisture of the hairs, and feed thereon. The Philosopher Their Origin-
affirms, that they proceed from the copulation of Lice, and therefore are called their eggs. They
are like to the flowers of *Jesemine* that grows with us. For as *Jesemine* brings flowers without seed,
so Lice bring forth eggs without young ones in them. They die either for want of nourishment, or Their End.
by using a Comb with close teeth, or by the use of such Medicaments as the old and new Phy-
sicians prescribe abundantly. *Pliny* minglith Allum with Vinegar, or Vinegar with gall of a Calf,
and also saith, they are killed with Goats milk. Also he commends Nitre mingled with *Terra Sa-*
mia and smeared on, and the powder of Harts-horn drank in wine. *Abenzoar* prescribes, to anoynt
the hair with the lesser Centaury, and Alkitrum. Brimstone in Vinegar takes away Nits, as also
Oyl mingled with Lie. *Marcellus* doth very much commend Hogs dung mingled with wine and
juice of Roses; also to anoynt with Honey and Sal Armeniack, but chiefly Oyl of Radishes with
a strong lie. *Hildegardis* provides a lie made of Date-stones, which being mingled with Oyl of
Radish roots, will kill the Nits. *Ardonus* mingles some sublimite of Quick-silver with spirit of wine:
And he saith also, that if the head be first wet with a Hens egge, and then with the juice of Sow-
bread, or Sea-water, that the Nits will never breed again. *Gilbert* an English man highly commends
the gall of any Creature, as also all bitter things, cleansers, and Aromaticall Drugs, with the juice
of Marigolds.

CHAP. XXXVI.

Of Aurelia, and a Wood-worm called Teredo, without feet.

That which the *Latins* call *Aurelia*, the *Greeks* call *χρυσάλλης*, the name is borrowed from the gol- The Name
den colour which appears in most of them. It hath no mouth, nor yet any apparent parts, and Descrip-
nor doth it void any excrements, nor yet eat, or move, unlesse it be moved by some body, or hurt. tion.
That which *Pliny* writes, that a *Chrysallis* hath a hard body, I think that is meant in respect of a
Catter.

Catterpillar. But that which he adds that it will move if a Spider touch it, though I know this to be true by experience, yet I doubt he borrowed those words from the Philosopher, and interpreted them amisse. For the sense seems to be thus. *They move, if they be touched, and they are covered with poe like to Cobwebs.* Aristotle speaks nothing here of a Spider passing over them, as Pliny seems to translate it. Aristotle shuts the *Aurelia* not only out of the number of Insects, but also of living Creatures, and determines them to be as it were the Caterpillars eggs. But what agreement is here with an egge? That is laid by another living Creature, and is void both of actual life and motion. The *Aurelia* is laid by none, but is changed from one to another, for it changeth its former shape into another shape, and retains both life and motion, not in possibility of being, but actually. But that doth not take away the life of it, because it neither eats, nor increaseth, for Dormice sleep all the Winter and eat nothing. The life of it doth resemble that sleep which is partly waking, wherein men are not properly awake, nor yet asleep; but are alive, and move a little. But I conjecture that the Philosopher wrote this, that he might confirm that Axiome of his to credulous posterity, that all Insects either lay eggs or little Worms. His words are these. *Insects first breed Worms, but that which is called Chrysalis, is an Egge, and afterwards from this is bred a living Creature, that at the third changing hath the end of its generation.* Yet it is manifest enough by what I said before, that an *Aurelia* is no Egge, and it ought not to be called a generation, but a transmutation of a Caterpillar into this, and of this into a Butterflie. I say this for that purpose, that such as adore Aristotle for a God, may remember that he was but a man, and that he was subject to humane errors. There are two kinds of *Aurelias* that I have seen, some are downy, and others smooth, both are of divers colours, and sometimes they are Gold coloured, which are the true Chrysalides, and others that are but bastard ones, are without any colour of Gold. They have their Original from the death of the Caterpillars, which as they do waste by degrees in certain dayes, so by degrees their covering grows continually more hard, and changeth into an *Aurelia*. These again the next Spring or Autumn, by degrees losing their life, a Butterflie comes forth of them that is bred by the like metamorphosis. What use they serve for, for the good of man kinde, I am wholly ignorant of. I know well enough how much they perplexed Aristotles wit by their wonderfull transmutation; and they set forth to us the boundlesse power of Almighty God.

The Kindes.

Their Originall.

Their End.

Their Use.

George Agricola only propounds to us the *Teredo* without feet, which from the brassen colour of it, he call *Kupter-worm*: It creeps like a Serpent, saith he, because it wants wings and feet. It is as thick as a small Goose quill, and it is as long as a Scolopendra: It is round, and breeds under rotten wood, and sometimes found hard by the Scolopendra, or long Ear-wig. You may easily finde the figure of it placed amongst the Scolopendræ.

CHAP. XXXVII.

Of Water Insects without feet, and first of the Shrimp or Squilla.

WE said before that all water Insects were with feet or without feet. Some of those that have feet, swim with six feet, as the Lobster, the Shrimp, the lake Scorpion, the Evec, and the Sea-lowse; others with four feet, some with more. We shall treat of them severally. The *Squilla* an Insect differs but little from the fish *Squilla*, but that it hath the sail-yards much shorter, and a more red colour, or rather a more earthly colour. Some of these are covered with a thin shell, and some again are smooth and naked. Those with shells live chiefly in small Brooks, and stick to the roots of Reeds or water-flags: They are of a yellowish colour, and sometimes of a white or Ash-colour. They go only with six feet, the rest that are

joynted to them, serve in stead of fins. The naked ones are either soft or hard. The soft ones are represented well enough by this figure, only suppose their heads to be of a bright Bay colour, and their body died with a dark Ash-colour. All those that are covered with a hard crust are made with joynts, but some have round joynts, others other fashions. The form of the round joynted is exactly represented here, if you suppose him to be easily dyed with a lighter red. And such is the colour of the first and second

second that are not round joynted. The third kinde is black upon the back, and with a brown belly; but they are all with a forked mouth, and that will hold fast what is applyed to it. The fourth kinde moves it self with the three former feet, and useth the rest that hang by instead of Oares. The neck of it, and the sailyards, and the nippers are of a watry red colour, the body is brownish or more Ash-coloured. The fifth hath a very black head, and the body like to a Pomegranate shell. The sixth seems to be cruel, and in the same form you see it, of an Ash-colour. All of them have hard eyes, and black, covered over with a membrane shining like unto glasse, which move continually almost, like to the ears of four-footed beasts. They leap quickly one

upon the other as the Fishes Squillæ doe in coupling, and when they grow bold and have liberty, they fill the Females with young. The time when they are ready for this is signified by a gentle biting: The Female takes hold with her mouth, and what she layes hold on she kills, and gives part of it to her companion; for they couple at the mouth, as Crabs and Lobsters doe. But what use they serve for in physick, I cannot finde either in writers or from Empiricks, who either knew not these Squillæ, or thought them not worthy to say any thing of them. Yet this is certain, that in *April* and *May* there is no better bait to catch Fish with.

C H A P. XXXVIII.

Of the Locust, Scorpion, Notonectum, the Grasshopper, the Wasp, the forked Claw, the Newt, the little Heart, and the Lowse, all Water-Insects.

THE Insect-Locust, is like the Lobster, for that cannot be called either flesh or fish: you see the figure of it: it is of a pale green colour: I have seen three kindes of Lake Scorpions, and I have them by me: the first is somewhat black, the other two are like to white

land: we call some Insects of the water *Neton ſia*, which do not swim upon their bellies as the rest do, but upon their backs, from whence it is probable that men learned the art of swimming upon their backs also. Some of these have eyes, shoulders, and bodies all black, some are green, some are fiery coloured, and some pitch coloured. For you shall seldom see two of them of the same colour; nature hath so variously sported her self in adorning them. Water-Grasshoppers hold the form described, but their eyes are extreme black, and their bodies are ash-coloured. The Wasp hath a brownish body all over, except the black eyes. The Forked Claw hath almost the same colour, but it is more full, it seems to want eyes, but it hath them hid within, whereby it both sees and perceives the object. The Lizard is of divers colours, and delights in catching Fish, it is common about the *British* shores, where it lyeth in wait to catch Fish. The *Corculus* hath the just fashion of a heart, the feet and head being taken away; it hath very little black eyes, and six legs of the same colour, & each with two claws. The Sea-Lowse is an Insect that is an enemy to all kinde of Whales, which by biting and tickling it puts into such a rage, that they are forced to run upon the sand, and hasten to dry land: I know nothing concerning the use of these creatures; but I seriously exhort posterity to search out the use of them.

CHAP. XXXIX.

Of the Flea or *Asellus*, and the *Scolopendra* found in the Sea.

THE Flea, or Sea-*Asellus* is like to a soft *Squilla*, but it hath but four feet (as I may say by *Gesners* leave) and by often and long leaps it frees it self from having many feet. It is called *Asellus* from its leaping, *Aristotle* calls it a Flea; from its bunch-back it is called a Sow: it is of a wan colour with blackness; the length of those that are in rivers is the breadth of ones finger, and their breadth is not above half a finger broad. But the Sea-fleas are larger, which when the tyde flowes are seen also oft-times in fresh waters: It shewes a wonderful deal of agility when men strive to catch it, or do but look upon it.

are bred, and do live.

The Sea *Scolopendra*, sometimes is of a grey colour, and sometimes you shall see others that are more red. These are longer and leaner, that is shorter and thicker. I saw both kindes in the year 1578. in coves of Oysters. For they are not found in the deep sea, as *Gesner* supposeth, but in the muddy standing waters, where the Oysters are fatted, there they lye hid; *Numenius* warned Fisher-men concerning these, when he said;

See therefore that you let not ingender,
The stupid *Julii* or deadly *Scolopender*.

They are as *Aristotle* writes lesse than the land *Scolopendras*, but not differing in their form. *Nonus* the Physitian makes of these a remedy to hinder hair from growing, or a depilatory, and highly commends it in his 34. Chapter. Take Frankincense, Vitriol, of each two ounces, sea *Scolopenders* three ounces, grinde them all well, and mingle them with the powder of Quicklime, then pull out the hairs first, and anoynt the places with that.

CHAP. XL.

Of Water Insects without feet, and first of *Oripes*.

NO Philosopher that understands as he should, will deny but that snow is water turned to froth, by long subliming in the air. In this Worms are bred which the Greeks call *vermes*. *Aristotle* writ something concerning these, which History I will briefly touch. In snow there are bred hairy Worms, very sluggish, and that move slowly, wherefore I reckon them amongst Worms without feet, so soon as they are taken out of the snow they die, as the Worms bred in the fire doe, being taken from thence: with snow that is old and begins to look red, they become red also, but those that are found in new snow are white. It is, saith he, a certain thing that snow can no more corrupt than fire can. And indeed they cannot corrupt, yet in both of them are living Creatures bred, and they are nourished in both. I cannot in any wise consent to *Eustathius* the Scholiast upon *Homer*, who affirms, that snow growes red from *Minium*, because those places are of a Cinnabrous quality, whence he conceives, that from the vapours rising from Cinnaber, the snow becomes red: I will not deny but that it is so in some places. But whether the Interpreter be pleased or not, we must needs grant that in some places the snow grows red, where no Cinnaber is. *Strabo* makes mention of such places in these words. In *Charzena* and the Countrey of *Cambicum*, and in places neer to the mountains of *Caucasus*, some little beasts are bred in the deep snow, which *Apollonides* calls *vermes*, and *Theophrastus* *vermes*, that is, Mountain little hairy Worms, like unto the greater *Teredines*. I think their generation as admirable, as of the fire Worms; yet living Creatures are more easily bred in snow, than in fire, because in snow there is much air, earth and spirit, all which the fire consumes abundantly. And if the heat of the Sun happen to be with these, I shall use *Sca-ligers* words, they make dung that smells the sweetest of all ordure. Also they are bred in abundance in *Carinthia*, as *Joach. Vadianus* reports. But *Strabo* in his Comment upon *Pempon. Mel.* addes a thing that is admirable, saying that these Worms are full of excellent water, which

Travellers

Travailleurs take, by breaking the bladder or coat it is in, and they drink this pressing it forth gently. For it is very whollome and seasonable when the fountains are troubled, as it falls out often in great snowes.

CHAP. XLI.

Of Horsleeches.

A Blood-sucker or Horsleech, in Latin *Hirudo*, in Greek *βδέλλα*, in Hebrew *Halukah*, in French *Sangfue*, in Italian *Sansuga*, in Spanish *Sanguisuela*, in High-Dutch *Ein agel so das blut saugt*, in English a *Horsleech*. These are water Worms that thirst exceedingly after the blood of living Creatures, and they will fill themselves with it sometimes till they burst and die. Some of them are without any passage through their belly, some are open behinde; we give you the pictures of them here. *Europe* hath scarce any open behinde, but in *America* and

India they are common. Those that are not open behinde, are obvious to every man, and when they are filled with blood, their skin seems checquer'd with fibres. Some of them are of divers colours, some green, black, brown, yet not venomous, only the bright bay and Chesnut colours, that are like to pills of trees. They breed chiefly in standing pools, where Cattel are wont to be watred, for from their feet earth and foulness are washed, and fall to the bottom, to say nothing of the sediment of their dung, out of which, that want not vital heat, living Creatures are bred. Once bred, they most greedily thirst after blood, and therefore they lie in wait in the very entrance of the pools, that they may light upon Horses, Oxen, Elephants, &c. so soon as they come to drink for thirst of cold water. *Pliny* writes, that they are so troublesome to the Elephant, that the beast is by their tickling and sticking in his snout, almost mad; which doth manifestly shew the wonderful power of Insects. For what is there greater then an Elephant? and what is there more contemptible than a Horsleech? Yet the greatnesse and wit of the Elephant must give way and yeeld to this Worm. They feed most on blood of beasts, and watry bloody matter; yet when they want sustenance, they fill themselves with the filth that riseth from the water. *Pliny* saith they vanish in the Spring, *l. 9. c. 51.* but we see that season to be most fit for the breeding of them. And indeed I can see no reason, that when they have overcome the Winters cold, they should not be able to stand out the Springs mildenes. And this we all know, that Horsleeches will die in the Winter, unlesse they be carefully preserved in warm water, and fed with blood very plentifully. If any man swallow a Horsleech, some perswade us to drink pickle, others snow-water: But *Asclepiades* bids us first to wash the mouth, and to put a soft Sponge wet in cold water into the mouth, that the Horsleech sticking to the Sponge may be drawn forth. After this he prescribes the juice of Duck-weed, and to cover the neck with cooling plaisters. But *Apollonius*, whose surname was *Mus*, gave the sharpest Vinegar with pickle to drink; but those that gave snow, did first warm it, and used it being dissolved, and they did use meat and drink at fit times to make the belly soluble, that they might drive forth the Horsleech, for they report that so they will oft-times come forth with the excrements. *Gal. l. 2. de Antidoto.* In the dayes of *Pliny*, wicked men did privily give Horsleeches to their enemies to do them mischief; but Rue with Vinegar, or only Butrer, (as against all venoms that did exulcerate) were a present remedy, *lib. 20. c. 13. and lib. 28. c. 10.* Their

Their use in physick is manifold. For some (I use *Galens* words, *lib. de different. sanguinis detrahendi modis*, Tract. 10.) take Horleeches and put them up, and they use them diversly: For when they are made tame they are easily put upon the skin; but those that are taken must be kept one day, and must be fed with a little blood; and so it will be that whatsoever venome they have in them, they will soon cast forth. But when we have need to use them, that part to which you will apply your Leeches must be first rubbed with Nitre, and must be anoynted, and scratched with your fingers, that by this means they may fasten the more greedily; but you must cast them into warm water that is contained in a large and a clean vessel, then you must lay hold of them with a Sponge, you must cleanse them with your hand from all filth and dirt, and so they will be fit to be applyed. And when you have set them on, lest that part they stick to should grow cold, you must powr on warm Oyl: But if they be to be applyed to your hands or feet, you must thrust them into the warm water that the Leeches are cast into. And if they will not hold fast, you must cut off their tails with a pair of Cizzers; for when the blood so runs forth they will not leave off sucking until you sprinkle salt or ashes upon their mouth: When they are fallen off, that venomous quality they use to leave behinde must be drawn forth with a Cupping glasse; and if that may not be done, you must use a Sponge to foment the place. And if yet any bloody drops run forth, apply meal and Cummin, and then binde on some Wooll wet with a little Oyl. But if yet the blood will not stop, lay on a linnen cloth wet in Vinegar, or burnt glasse, or a Sponge first put into liquid pitch, and afterwards burnt. And this also you must observe, that Leeches draw that blood that is next the flesh, and not that which is contained in the Centre of the body. Men use them commonly in stead of Cupping glasses. Mark also that you must take them off when they have drawn half the blood. And you must beware that the blood run not forth so long, untill it be sufficient: For the part it self will grow cold, both by reason of the Leeches that are naturally cold, and because of the air that compasseth us about. So far *Galens*. But *Cardan* bids us not to anoynt the place with Nitre, but with milk, that they may fasten the sooner; and withall to pinch the Leech close, that striving for revenge he may open the vein, *lib. 7. de rer. var. c. 28*. What help they were to *Dionysius* the Tyrant of *Heracleota*, we may read in Histories, who representing rather a beast than a man, for he died with a mighty great paunch, had been eaten by the Worms long before, unlesse Horleeches had been applyed to both his sides, and drawn forth daily some quantity of the humours he was charged with. It were too tedious to reckon up all the melancholique and mad people, that have been cured by applying Leeches to the Hemoroids in their fundaments. Yet I may not over-passe the Noble *Richard Cavendish*, (the most learned Unkle by the fathers side of that famous Navigator through the world *Thomas Cavendish*) who was perfectly cured of his Gowt that had held him many years, only by applying Horleeches to the Emroids in *Aug.* every moneth, so that now to the great wonder of all the Court, he walks alone without any help, and being sound and void of all pain, he lives an old man. Also Horleeches set upon the fundament, will so wonderfully pluck back the humours that run from the whole body to the joynts, that they will presently ease the pains like a Charm. This I proved at *Lions* upon an excellent Musitian, one *Rosolus*; who for the great pains he endured, and by continual waking, fell into a burning Feaver, with raving, in the Dog-dayes, at which time *Hippocrates* saith it is dangerous to purge. It is in this case such a remedy, that it is to be preferr'd before all others, for they draw from the whole body without any trouble or losse of a mans forces. *Jac. Aubert. Exercit. 50. progymnasm. Fernel. Abdit. Godfridus a Cenami*, a *Venetian*, a famous man, and my very great friend, for just and lawfull causes, who told me that he saw one who had the joynt Gowt, who lived many years free of all his pains, only by applying Leeches to the part that was in pain. *Math. de Grad. and Savanrola, Jacob Dournet, Apolog. lib. c. 3.* perswade the same remedy. Also *Gilbertus Anglicus* reports, that the Lowlie disease generally is to be cured with the ashes of Horleeches boyled with Storax: For they are not only usefull for men whilest they are alive, but when they are dead and burnt to ashes. *Pliny* reports, *lib. 32. c. 7.* that Horleeches will black ones hair, if they be corrupted in black wine for sixty dayes: Others bid us take one sextarius of Leeches, and let them lie to corrupt in two sextarii of Vinegar, in a leaden vessel for so many dayes, and then to anoynt with them in the Sun. *Soriatius* relates, that this medicament is of so great force, that ulesie they hold Oyl in their mouths that die the hair, it will also black their teeth. *Meges* writes, that live Frogs putrefied in Vinegar, will take off the hair, but the ashes of Leeches anoynted with Vinegar will doe the same.

CHAP. XLII.

Of Water-worms.

IN waters both salt and fresh, great and small Worms will breed of putrefaction, especially in Summer, very like Earth-worms, but they want that knot or chain about their necks: Also they are by far more sharp and lean; oft-times they lie in the sand, and they cast up earth out of their holes, as Earth-worms do: In sweet waters that are standing, and not deep, there is found a kinde of Worms of a full red, that resemble in shape the *Teredo* without feet, but that they have greater heads. Their tail is forked, whereby they stay themselves, till lifting up their heads they may finde a place to fasten the rest of their body, and so they creep upon the mud and stones, and so they move in a brandishing manner crookedly. In Summer, when it is clear weather and hot, they come forth together in great numbers, but if the mud move never so little they presently withdraw themselves. The English call them *Summer-worms*, either because they are seen only in Summer, or they die in Winter. In the *Mediterranean Sea* there is a round Worm found as great as a great Snake, and of the same colour, but it hath neither head nor tayl, as *Weckerus* observes. Sometimes it is twenty foot long. What may be the use or nature of these I have not yet observed. But I hope that others will discover that light that shal shew us both. Yet this is certain, that those Worms serve for baits to catch Fish, especially those small red ones, and Fisher-men diligently seek after them for that purpose. We call them *Water-worms*, because as Earth-worms will not live long in water, so Water-worms put upon dry land soon die, they wanting Air, and these for want of water.

FINIS.

An Index of all the CHAPTERS contained in the
Second Volum.

Book I.

Chap. 1.	O F Bees, their name, description, and differences,	page 889
Chap. 2.	Of the politick, moral, and economical virtues of Bees,	892
Chap. 3.	Of the creation, generation, and propagation of Bees,	897
Chap. 4.	Of the use of Bees,	905
Chap. 5.	Of the name of Honey, the difference and use.	907
Chap. 6.	Of Bee glee, Pissoceros, Bees meat, with the nature and use of them,	915
Chap. 7.	Of Drones and Theeves.	917
Chap. 8.	Of Wasps,	921
Chap. 9.	Of the Hornet and the Tentredo,	927
Chap. 10.	Of Flies,	931
Chap. 11.	Of the differences of Flies,	934
Chap. 12.	Of the use of Flies,	944
Chap. 13.	Of Gnats,	952
Chap. 14.	Of Butterflies,	967
Chap. 15.	Of the Glowworm,	975
Chap. 16.	Of Locusts,	981
Chap. 17.	Of Grasshoppers and Crickets,	989
Chap. 18.	Of Mothes, called Blatte,	997
Chap. 19.	Of the Buprestis or Burncow, and Cantharides,	1000
Chap. 20.	Of the Cantharides or Spanish Fly,	1003
Chap. 21.	Of Beetles,	1005
Chap. 22.	Of the smaller Beetles,	1015
Chap. 23.	Of the Proscarabæus, or oil Beetle, and the water Beetle,	1016
Chap. 24.	Of the Gryllotalpa, Fen Cricket, Mole Cricket, Evechuro or Chyrworm,	1018
Chap. 25.	Of the fire Fly,	1019
Chap. 26.	Of the Water Spider,	1021
Chap. 27.	Of the Earwig,	1023
Chap. 28.	Of the Scorpion, Ant, and Lice winged,	1024
Chap. 29.	Of the Wood-Wig Lowse with wings,	1025

Book II.

Chap. 1.	O F Caterpillers and their differences, and chiefly of Silk-wormes and Silk-spinners,	pag. 1029
Chap. 2.	Of the other smooth Caterpillers,	1032
Chap. 3.	Of Caterpillers rough and hairy,	1034
Chap. 4.	Of the original, generation, aliment and metamorphosis of Caterpillers,	1039
Chap. 5.	Of the quality and use of Caterpillers, and the remedies against hem,	1040
Chap. 6.	Of the Whirlworm,	1042
Chap. 7.	Of the Wine Caterpillar, called Staphylinus,	1044
Chap. 8.	Of the Scolopendra, and Juli,	1045
Chap. 9.	Of Hoglice, or Chistips,	1048
Chap. 10.	Of Land Scorpions,	1049
Chap. 11.	Of the name and differences of Spiders,	1058
Chap. 12.	Of hurtful Spiders, or Phalangia,	1059
Chap. 13.	Of the tame or house Spider,	1065
Chap. 14.	Of certain kinds of Spiders observed by Aubours,	1070
	Dddd d 2	Chap. 15. Of

The Contents of the Chapters.

Chap. 15.	Of the generation, copulation, and use of Spiders,	1072
Chap. 16.	A commendation of Ants, wherein is described their differences, nature, cunning and use,	1074
Chap. 17.	Of the Cicindela, and female Meloe, and of the Hornet and field Chetlep,	1080
Chap. 18.	Of mineral worms with six feet,	1081
Chap. 19.	Of Worms in vegetables with six feet, and first of Worms in Trees,	1082
Chap. 20.	Of Worms in puls, fruit, corn, vines, herbs,	1085
Chap. 21.	Of the use of Worms in Minerals, and Vegetables, and the way to destroy them,	1088
Chap. 22.	Of Worms in living creatures that have six feet, and first of Lice in men,	1090
Chap. 23.	Of Lice in Brutes and Plants,	1094
Chap. 24.	Of Hand-worms and Mites, and worms in living creatures,	1094
Chap. 25.	Of Wiglice,	1096
Chap. 26.	Of Sheep, Tikes, and the like,	1098
Chap. 27.	Of the Moth that devours clothes,	1100
Chap. 28.	Of the flea,	1101
Chap. 29.	Of the Insects wanting feet, and first of the Intestines of the earth,	1103
Chap. 30.	Of Worms in living creatures,	1106
Chap. 31.	Of the description of Worms in the Intestines,	1108
Chap. 32.	Of the original of Worms in the Intestines,	1110
Chap. 33.	Of the signs and cure of Worms out of Gabusinus,	1111
Chap. 34.	Of Worms bred without the Intestines, and first of Eulai, Gentils or Maggots,	1122
Chap. 35.	Of Nits,	1123
Chap. 36.	Of Aurelia and Terebo without feet,	ibid.
Chap. 37.	Of water Insects without feet, and first of Squilla or Shrimp,	1124
Chap. 38.	Of the Locust, Scorpion, Effet, Grasshopper, Hornet, Forked claw, Lizard, Corculum and all water Insects,	Lowse, 1125
Chap. 39.	Of the Flea or Sow, and Scolopendra of the sea,	1127
Chap. 40.	Of water Insects without feet, and first Oripes,	ibid.
Chap. 41.	Of the Horseleech,	1128
Chap. 42.	Of Water Worms,	1130

THE END.
